

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 53. NEW SERIES.

SATURDAY, JANUARY 4, 1845.

PRICE 1d.

A FEW WORDS TO OUR READERS.

It is nine years since we addressed our readers in a formal manner about ourselves. Will they have patience with an egotism which observes such a long silence? We presume they will, and shall therefore proceed to say a few words about our position and prospects.

The Journal is now entering upon its fourteenth year. We begin to get letters from lady subscribers, who tell us they commenced reading it when they were little girls, and now have two babies rapidly rising to strike in as readers too. In fact, it is becoming a somewhat venerable publication. Well, we trust it is not the worse for that, but somewhat the better. We are at least assured that its acceptance with the public is not less than it ever was, for its sale—raised one-half by the change of size—is not much under ninety thousand copies. The most popular magazines circulate, we believe, from six to nine thousand; but the sale of the Journal in its magazine shape alone (the monthly part being strictly a magazine) is about forty thousand. During the currency of this work, we have brought out several others: a series of books designed to aid in the realisation of an improved education;* a kind of encyclopædia for the middle and working-classes;† a history of English literature, chiefly intended to introduce the young to the Pantheon of our national authors.‡ And all of these works have met with success hardly less marked than that of the Journal. Indeed, that of the Information for the People has been considerably more, for the average sale of the numbers of that publication has been about a hundred and thirty thousand—a fact, we believe, unprecedented in the same department of literature. More recently we have commenced another work, a series of Tracts designed for the instruction and entertainment of a still humbler class of readers;§ and already it would appear as if the ordinary sale of this work is to be greatly beyond that of any other, the impressions required of the first few numbers (all yet prepared) having been in no case less than a hundred and fifty thousand, and in some instances nearly two hundred thousand, copies. Verily, it must be admitted, there is here a vast diffusion of literature, of whatever kind it may be. Or may we not rather say that these things mark an entirely new era in literature, something which throws all the former efforts of the press into the shade?

Let us just look for a moment into the details of this phenomenon. We write at present in a huge building

of four storeys, flanked by a powerful steam-engine, and with the noise of ten printing machines continually sounding in our ears. Several of these are engaged in working off impressions, the production of which at a common hand-press, such as formed the sole means of typography a few years ago, would have required nearly the time then requisite for a voyage to India and back. A hundred and twenty persons are required for all the duties which proceed in this large structure, though these have exclusively a regard to works edited by ourselves. Upwards of a quarter of a million of printed sheets leave the house each week, being as many as the whole newspaper press of Scotland issued in a month about the year 1833. Our publications, which at first were expected by the booksellers to be the ruin of their business, do not yield them less than fifteen thousand pounds a-year of profit; while yet the number of ordinary books published each year, instead of being diminished, is considerably increased. These are some of the material details; but who shall say what are the particulars of the moral results of this enormous contagion of paper and print! We willingly allow each man to judge from what he observes in his own familiar circle. We have, for our part, a general and all-sufficient faith.

Friends to whom we chance to mention some of these matters, often say to us, 'What a power for good or evil you possess!' There could not be a greater mistake. It is not a power for evil at all. This has been tried, and fully proved, by other editors. Similar works without number have been presented to the public, but, because they pandered to the meaner feelings of our nature, they invariably failed. We have ever felt, that, whatever might be our own inclinations, we must aim at the pure, the elevating, and good, if we would wish our publications to acquire any permanent hold of the public mind. It is a common notion, we believe, among the clever fellows, that the public is to be gulled, tickled, addressed as a child, and that, the lower the tone assumed, they will be the more pleased. Our experience says quite the reverse. We have, and always have had, an unfeigned respect for both the intellectual and moral character of the public. We sincerely believe that the higher sentiments rule its general procedure, and that the grosser souls are in all ordinary circumstances powerless. We therefore never doubted that, in earnestly seeking to give good counsel and innocent entertainment, we were taking the course which common prudence would have dictated, all the sophistications of all the Jenkinsons notwithstanding; and it is thus that we feel assured of our publications being attended with good effects upon the community. They only have a large sale because they address and meet responses in the better feelings of the mass of our countrymen.

When the publications of Mr Knight and others are

* Educational Course—37 volumes published.

† Information for the People, 3 vols. royal 8vo.

‡ Cyclopædia of English Literature, 2 vols. royal 8vo.

§ Miscellany of Useful and Entertaining Tracts, appearing in weekly numbers at a penny and halfpenny each.

taken into account, it will be seen that the amount of literature now diffused among the people must be something very different from what it was a few years ago. On a moderate calculation, we cannot doubt that our own publications are fully doubled by the other works of a respectable kind now issued weekly; that is to say, there are not fewer than half a million of cheap sheets published every week. Add to these the very considerable number of cheap book-publications, copyright and otherwise, and it must be apparent that there is a moral agency at work in this country such as has never been formerly known, except in the most feeble form. Is it not now, indeed, for the first time, that the powers of the printing-press have been turned to their right account? And yet, after all, it is highly questionable if anything like full advantage has been taken of the powers of this marvellous engine. There is no default in its own mechanism, but the mechanism for the diffusion of its productions is still far from being what is desirable. The system of bookselling in this country has not undergone an improvement at all comparable to that which we have seen in the paper-making and typographical departments. No fault is it in the members of that excellent fraternity. But books such as we refer to ought to be sold by many others besides ordinary booksellers. Why should it be that tea, tobacco, and even less approvable articles demanded by the people, should be purchasable in the smallest quantities in every village in the empire, and not that literature which has become, in one form or another, almost as much a necessary of life as any? Surely, in many of the little establishments where the needs and cravings of the frail body are supplied, those of the immortal spirit might also be gratified; and that without necessarily diminishing the trade of the ordinary booksellers? One fact will illustrate this. In a little village, where at one time none of our publications were sold, a philanthropic gentleman induced a female dealer in small wares to commence selling the 'Tracts.' She quickly found regular customers for forty copies. Here were forty copies sold where formerly the work was unheard of; and we cannot doubt that thousands of places are in the like predicament. There must certainly be some improvement in the bookselling system of the country; we must have this kind of wares presented in many quarters where it formerly was unthought of, ere we can say that the system of cheap publication is complete, or has 'gathered all its fame.' A benevolent friend has suggested that persons verging upon pauperism might often help themselves in some degree to a livelihood, if individuals taking a kindly interest in them were to furnish them with a first stock of such wares. We have had the plan tried in several instances, and have found it effectual.* Perhaps by such means, in addition to all others, the extreme limits of the diffusibility of popular literature might in time be reached.

When this point is attained, and great effects begin to become apparent to those who watch the signs of nations, it is not unlikely that the humble services of the individuals now addressing the public will be remembered and inquired into. It will perhaps be recollected that Chambers's Journal was the first periodical work which aimed at giving respectable literature at a price

which made it accessible to every class of persons really desirous of reading, and that in that and several other publications, without the slightest extraneous support, its editors arrived at and maintained for several years an extraordinary degree of success. May it not then be asked, what was the cause of this success? To what are we to attribute the existence of that vast ten-machine printing-house? Will it be worth while to listen for a moment to the impressions which were entertained on that subject by ourselves? Presuming that there may be some curiosity on such a point, we will here mention that we attribute it not to any peculiar literary talent; we attribute it not to any extraordinary intellectual gifts; neither do we think fortune had anything whatever to do with it. It arose solely from the view we took of the duties resting upon those who make a profession of the pen. We felt, in the first place, that foresight, punctuality, and other homely and prudential virtues, were necessary even for the purpose of enabling us to possess our minds in peace—that peace without which no studious life can be conducted to any good results. And it was but a corollary from that view, that we should have a publishing system under our own command, as by no other means could the requisite unity of movement, and procedure have been attained. On this point we would observe incidentally, that we trust yet to make out a problem of no small consequence to men of letters—that is to say, we trust to establish, that to employ a printing and book-selling system to work out his purposes, is a much more eligible position for the literary labourer, than to come with all his powers of thought, and the aspirations attending them, and subordinate these to a man of trade. We think it will be found that the first position, which is ours, is that by far the best fitted to secure independence of action, and even that elevation of mind which is supposed to rest apart from trade, as well as exemption from those degrading cares which are so hostile to the exercise of the higher faculties, and have been the shipwreck of so many votaries of letters. We further felt that the tasks assumed by us were of a very different character from what their external features indicated to the shallower class of minds. Even to speak of materialities alone, the aggregate vastness of a cheap publication was calculated to impress a strong sense of the importance of such a work. What came before the eyes of individuals as a single sheet at an infinitesimal price, presented itself to our sense in colossal piles of paper and print, and large commercial transactions. At the fountain-head, its respectability, in the common sense of the word, could not be matter of doubt, whatever it might in the remote rills of diffusion. But, remarking the great apptency of the middle and humbler classes for the reading of such works, it was impossible not to advance to far higher considerations, and see, in the establishment of such a miscellany as the Journal, the attainment of a predicatorial position hardly paralleled in the country. It fully appeared that such a work, if conducted in a right spirit, might enable its editors weekly to address an audience of unexampled numbers. We felt that by this means a vast amount of unequivocal good might be effected amongst the humbler classes in particular. Coming before them with no stamp of authority to raise prejudice, but as the undoubted friend of all, it could convey counsel and instruction where more august missionaries might fail. Gaining the heart of the poor man, always inclined to jealousy, it might, by dint of its absolute transparent well-meaning, force reproofs and maxims upon him which he would take from no other hand. By such a work the young might be, even in the receipt of amusement, actuated to industrious and honourable courses. Everywhere, by presenting entertainment of a pure nature, and of superior attractiveness, that which was reprehensible might be superseded. Nor might it be impossible, even in so small a work, to present papers of an original kind in the departments of fancy and humour, as well as of observation and re-

* A mendicant, applying for alms at our office in Glasgow, was furnished with two copies of a tract, that he might endeavour to sell them in the streets, and thus make money by a more legitimate mode. He disposed of them in ten minutes, and came back with the money to purchase more. Having sold these also, he returned for a new supply, and, in short, his transactions in four hours reached six shillings, leaving himself a clear gain of one and sixpence. He was to have come back to renew his efforts next morning; but, unfortunately, from whatever cause, he never re-appeared.

fiction, such as might be expected to cultivate the higher powers of the popular intellect. While, then, many superficial persons scoffed at the course we had entered upon, we saw in it the means of a large usefulness, and gave ourselves to it with cordial good-will. Determining first upon a few leading principles—particularly that political and theological controversy should never receive a moment's attention; animated by sincere and earnest wishes to promote whatever was clearly calculated to be beneficial to our fellow-creatures in the mass; despising all trivial and petty objects, and aiming ever to confer a dignity upon our own pursuits—we advanced in our course, and persevered in it year after year; never once doubting that the issue would justify and sustain our first resolutions. The result, we may surely say, is to some extent determined, and that in a manner favourable to the soundness of our views; for how otherwise could it be that (to look no higher for proof) there is at this time no literary system in the country which approaches ours in magnitude? How else should it be that, while all other literary operations are conducted with more or less jarring between associated interests, and while most have to resort to extraneous expedients for success, we scatter the matter of hundreds of thousands of volumes annually over the land, without experiencing the slightest disturbance from scurrilous details, or ever having to look a moment beyond the intrinsic value of the article itself for a means of arresting public attention.

We would, in conclusion, express our humble trust that the ordinary readers of the Journal can be under no risk of misunderstanding the nature of these remarks. We have spoken in the language of earnestness and of truth, on a subject on which we are conscious of entertaining other besides feelings of self-love, and whose public interests are, we think, as much concerned as our own. This kind of language usually meets with sympathy, and we humbly hope that on the present occasion there will be no exception from the rule.

SHORT NOTES ON THE WEST INDIES.

BY A LATE RESIDENT.

FIRST ARTICLE.

THERE are three things which forcibly attract the eye of a European upon entering a town in one of the West India islands, and these are, the houses, the streets, and the colour of the people. The houses are rendered remarkable from various circumstances. Built chiefly of wood, they are shingled, and not tiled, and are generally painted white, with green Vanotian blinds terminating the upper part of the front of each storey. In towns, the streets of which lie on a declivity, it is not unusual to observe the houses perched high above the streets, their elevation being occasioned by the gradual washing away of the soil by the heavy rains which fall at certain seasons. The advantage of such a location is, a slight freedom from the dust which three-fourths of the year lies about in clouds; but perhaps this is counterbalanced by the necessity for more frequently repairing the foundations of the houses, and of adding occasionally to the flights of steps by which they are approached, lest communication with the inhabitants should be entirely cut off. One striking peculiarity of a West India house is the circumstance of its being incapable of almost any species of privacy. The apartments all open into each other, and are so situated, that a stranger on his first entrance has, for the most part, a panoramic view of every one, from the piazza to the kitchen. One of the reasons assigned for the adoption of this style of building is, that it produces a free circulation of air; another, that it enabled the master or mistress, during the periods of slavery, to keep a watchful eye over the proceedings of the slaves. But whatever the cause, to a European so complete an exposure of the whole economy of a domestic establishment is far from pleasing.

I have spoken of the piazza. This every one knows to be an apartment of, or adjunct to, the house—half-promenade, half-sitting room. Around this are the Venetian windows placed, and in it the family sit in the cool of the evening, to receive the full benefit of the 'land-wind,' to enjoy social converse, observe the passers-by, or pass the time in other equally important occupations.

The houses have no bells, and knockers are not universal; the knuckles, a walking-stick, or an umbrella handle frequently supplying their place. Carpets are unknown, but oil-cloths are sometimes used in their stead, being cooler. The floors are, however, more frequently polished, as in France; with this difference, that the hands and knees are employed in the one case, and in the other the feet. Stoves and grates are of course unnecessary, and the chimney-tops which adorn the roofs of houses in European towns are absent.

There are few moneyed builders, or speculations in building, in the West Indies. It therefore follows that there is little uniformity in the situations of the houses, and that a house which requires to be propped up, frequently stands adjacent to one newly erected. This gives the towns an exceedingly irregular and unsightly appearance, notwithstanding that the streets run generally at right angles. The irregular appearance is increased by a want of uniformity in the erection of the approaches to the houses, or flights of steps, and sometimes the absence of any such conveniences. The carriage ways are not paved, and I may add, that causeways or flag-pavements for foot-passengers are seldom to be met with. In the rainy seasons, the water accumulates in these streets in floods, and foundations—sometimes old houses—are washed away. It is no uninteresting sight to observe the 'rivers' rushing down the principal streets during a heavy shower of rain, and the circumstances which usually accompany such an event. On come the floods, foaming and frothing at every bound; now eddying deep in a hollow of the street, now whirling round some immovable obstacle. Away go steps, stones, pallings, fences, trees, &c. till one is disposed to think half the town in danger of removal.

The streets being usually in straight lines, one is enabled generally to see their whole length: and when the mountains terminate the view at one end and the sea at the other, the effect is beautiful, and compensation in some degree for minor irregularities, bad repairs, or heavy sand. At any rate, while admiring the beauty and grandeur of the distant mountains, or the majesty of the somewhat nearer sea, all remembrance of unsightly defects, even to the droves of hungry pigs which rove in all the dignity of filth and indolence about the streets, is lost. But perhaps the different hues observable in the visage of the population, present to the stranger a more interesting, because more extraordinary appearance. There are few shades of human complexion, from the sickly white of the Albino to the deep black of the Mandingo, which may not be observed in one of the towns of the West Indies. To the stranger full of the memory of the rosy cheeks of Europe, the sallow tint which pervades most countenances conveys the impression of illness; and a dread of miasma, fever, &c. is apt to come across his mind. In bodily health, however, there are few among those whom he observes inferior to the heartiest peasant in England; and 'Johnny Newcome' would perhaps be startled to learn, as is asserted on good authority, that he must part with a portion of his florid and robust health before he becomes acclimated, and beyond the probable reach of that terror to Europeans—yellow fever.

The Negro Dialect.—When the negro addresses a stranger with 'Huddie, mame,' a little reflection may enable the latter to discover the meaning, 'How do you do, master?' When he says 'Ger-a mighty bless you,' a little further reflection may lead to the discovery, that he intends to exclaim, 'God Almighty bless you.' When, however, rolling his tongue, and giving a peculiar

broadness to his words, he perhaps inquires, 'An da warra fa, sa, you bin com ya?' the stranger will most probably be fairly puzzled. Nor will he readily learn to comprehend the language of the old Africans. The Creole negro, however, prides himself on his English, and these the stranger may soon very readily understand, although the dialect which is spoken by the Creole is still but of a mongrel description.

From hearing the negro dialect so commonly spoken, the younger branches of respectable families insensibly fall into the habit of speaking it. Hence, when children from England arrive in the West Indies, the purity of their language and pronunciation is a subject of general admiration. And, indeed, pure English will always command attention; for even the heads of respectable families are often themselves not free from a 'touch of the negro brogue,' and many, particularly in country districts, acquire a drawing tone by no means agreeable.

It has been charged against the slave proprietors of the West India colonies, that they invented the negro dialect for the purpose of degrading that class of persons, and keeping them in ignorance. This seems rather a far-fetched charge. The most natural mode of accounting for the dialect seems to be, to regard the pronunciation as originally African, and the jumble of words sometimes used, as a natural admixture of the several dialects of the African tongue with the English, Scotch, Irish, French, and Spanish languages. As the African slave happened to be settled on the property, or attached to the establishment of an Englishman, Scotchman, Irishman, Frenchman, or Spaniard, he would learn a portion of the language and accent of each, which would be communicated to his fellow-countrymen, receiving in return a similar communication of what the others had learned; and the whole being uttered according to the best of their ability—but still with a strong infusion of the African accent—the dialect now under consideration might readily have been formed. Assuredly it would be impossible to invent it; while the master or mistress, so far from entertaining an idea of intended degradation as attached to it, very frequently uses it in a kind of playful mood, when not required to resort to it for the purpose of rendering him or herself intelligible.

An inquiry into the properties of the negro dialect might prove interesting to the philologist. If attempted, among its chief characteristics would be found a frequent elision of terminal consonants, and a fondness for terminal vowels—a constant change in the sound of vowels, most usually from a fine to a broad sound—a brevity of expression, and contraction and union of words—a predilection for the letter r—a substitution of d for th—and probably a collocation of words in a sentence not far removed from classical—the whole forming, as might be expected, a most uncouth and unmusical mode of communicating ideas.

The Mixtures.—These mixtures will be the death of us,' observed a lady at the elegant supper-table at a 'ball' given by Sir —. 'Which?' said a wag; 'the sweets or the company?' The lady meant the company; but as more than fair justice had been done to the dainties and delicacies of the table, there was some point in the inquiry.

It is some years since those high in authority in the colonies overstepped the barriers which prejudice had interposed between the social mingling of the several classes, and extended their hospitality to respectable parties, of whatever colour they might be. But no levelling of distinctions gives satisfaction, and consequently ebullitions of feeling similar to the above occasionally take place. They are, however, chiefly confined to a class of persons whose day went by with the fall of slavery; and a new order of things is quickly springing up, and a new class of persons arising, who all seem willing to admit that respectability of education, occupation, and character, are the only just criteria by which to judge of claims for admission into the first circles of society.

The 1st of August.—The day of universal freedom in

the colonies rose brightly and happily for that numerous class of individuals who, first as slaves and subsequently as apprentices, spent their lives in thankless and unrequited toil. It rose serenely and calmly; no noise or bustle, no commotion or disturbance was heard; and as the soft voice of prayer and thanksgiving went abroad upon the breath of morning, a stillness as of the holy Sabbath told that the day would be kept as one of solemn fast. The public offices remained closed, and private individuals did honour to the occasion, in abstaining from pursuing their accustomed daily avocations. At the usual hour of public prayer might be observed thousands proceeding to the several places of worship—chiefly, however, those for whose benefit the great boon had been given. The occasion will induce us to believe that their prayers were fervent, and their thanksgivings sincere. The service over, the emancipated greeted each other with heartfelt congratulations at the arrival of the day which many among them had never expected to behold, but which as a body they had so ardently desired. Their countenances were lighted up with joy, the laugh went round, and each seemed supremely happy.

Were there, however, no melancholy hearts on this great day of rejoicing? were all faces lighted up with smiles? or were there not heavy hearts and weeping eyes? There were. The master had been deprived of his 'property.' He could not sympathise in the general joy. True, compensation in part had been awarded him; yet the certainty with which he could previously look forward to the cultivation of his land had been taken away, and to him the future was now a blank. His heart then was heavy. The great number of persons dependent on the prosperity of the master partook of his doubts and fears. Their hearts were also heavy. A number of females depended for subsistence on the weekly wages which they received for the services of one, two, or three slaves. When the compensation which they had received had been expended, what resource had they left? None, probably, save the parish. Their hearts then were also heavy. Indeed, on this great day of the mighty triumph of justice and benevolence over wrong and despotic principles, it is difficult to say whether the amount of sorrow and suffering which was felt exceeded or fell short of the amount of joy which seemed so universally to pervade at least one portion of society.

Domestic Pets.—In England, the mistresses of an establishment pets a parrot or canary bird. In the West Indies, she sometimes also pets a little black or coloured boy or girl, who in the end turns out of course to be entirely useless either to him or herself, or any one else. My next-door neighbour, an old maid, who had apparently passed the grand climacteric, had a little black boy, and although the only servant on her premises, he was converted into a pet. The little fellow, at all times obstinate and remarkably insolent, would sometimes prove refractory, whereupon his mistress would strap him. At length, when matters were about resolving themselves into an appeal to the whip, he would climb up a neighbouring tree, and there, occasionally laughing at the old spinster, he would remain till her rage was over, or he was required to perform some domestic office, when, a truce being agreed on, he would leisurely descend. Parties who convert their young servants into pets are not probably aware of the pernicious effect of their intended kindness, or rather perhaps of the gratification of their own feelings. It is impossible to prevent the individuals petted from forming an erroneous idea of their position, and imbibing notions quite incompatible with future service. With these notions they are frequently at the death of their mistresses left unfriended, or, becoming too old to be made pets of, they are cast off, and thus society is burdened with an idle, discontented, ignorant, puffed-up, and ultimately demoralised race. I have every reason to think that most of the profligate women in the West India, as well as most of the idle and dissolute of the lower classes, have com-

menced their career as household pets, and that they have, for their unfortunate and degraded condition, chiefly to thank the injudiciousness of those with whom their periods of infancy and youth were passed.

Acuteness of the Negro.—The acuteness of the negro (and it may be necessary to observe that the term 'negro' is used by me simply in a distinctive sense) has become proverbial. Few, it is known, will overreach him in a bargain where ample discretion has been allowed; and his penetration of character is remarkable. In no mode, however, perhaps, is his shrewdness more apparent than in the converting of his philosophical and moral deductions (if I may be permitted so to speak) into proverbs. There are not many occurrences of a moral or immoral tendency, and yet fewer states of being from which a useful lesson may be derived, for which the negro has not some appropriate adage or proverb. If a negro wish forcibly to express that he has been treated with ingratitude, he says, in his most quiet and resigned manner, 'Good me do, ténkee me get.' If he wish to mark the neglect with which the memory of the departed often meets, he exclaims, 'Man dead, grass grow da him door.' If he wish to express the restraint under which he lies in the expression of his sentiments, he will tell you, 'No say fe want a tongue, mèk cow no talk.' When he would point out how mean and insignificant some men appear when overtaken by misfortune, who are otherwise bold and obtrusive in their demeanour and conversation, he will say, 'When trouble ketch man, buoy britches fit him;' and when he would express how much superior is natural ability without education to education without ability, he exclaims, 'Cunny better dan education.' 'When trouble day da bush, no bring him in da house,' is one of the adages by which he inculcates caution; and 'Any cry will do fe berrin,' a proverb in which he very satirically expresses the insincerity which too frequently attends the tears of parties at the funeral of a deceased person. I have no doubt a volume might be filled with similar pithy sentences, all in common use among the negroes, and tending to show that this class of persons possess a great deal of acuteness, and are neither deficient in observation nor in judgment. The language in which their ideas are expressed is uncouth, nay, if you will, vulgar, but we know that the diamond is valuable even though unpolished.

Superstitions.—Belief in ghosts is about the most common superstition that can be found in any nation; and there are few of the old unenlightened Creoles of the West Indies who do not pretend to have seen, heard, or felt innumerable ghosts. The enlightened portion of society, as in Europe, either believe or disbelieve these supernatural appearances, according as their love of the marvellous or their moral idiosyncrasy directs. I have heard well-informed persons of both places contend for the existence of ghosts, and quote Scripture in support of their views. I knew a talented lady in the West Indies who laboured under the firm conviction that a deceased brother had returned to earth, and spoken to her; and that her deceased husband had entered her bedroom at night while she lay in bed, and played with her feet. Superstitions of this nature are, to say the worst of them, idle. There are others, however, which bespeak weakness of intellect, depravity of heart, and gross mental obscurity and demoralisation. Among the first may be classed certain ceremonies which even at this day accompany the event of death in the families of many old black and coloured persons, who should certainly know better. As soon as a death takes place in such families, every particle of water in the house at the time is thrown away; for death cools his dart in the water as he departs, and it would be improper, if not injurious, to drink it. All the mirrors and looking-glasses in the house are covered, or turned to the walls, lest, forsooth, the spirit of the departed should be reflected in them; while, immediately after the removal of the corpse, the bed on

which it was laid is made up, a jar of water placed in the room, and a light kept burning for nine nights; for on these nine nights the deceased returns to his room, when he would require a light to guide his footsteps, and water to quench his thirst. These superstitious practices are only surpassed in folly by the feasts which were formerly held over the graves of the dead African or other party, and the libations offered up at such graves. They prevail in nine-tenths of the old coloured and black families, although it is but justice to say that the younger and more enlightened branches regard them with contempt.

One of the superstitions of a more serious nature, yet equally ludicrous, is the belief that the devil sometimes comes for the soul of the departed who has spent his life in this world as the wicked often do. I am not aware that his Satanic majesty is ever seen; but as he comes at night, and is supposed to be black, his invisibility may be accounted for. However, the rattling of the chains which he brings for the soul of the deceased is distinctly heard, and not by one or two persons, but by a whole neighbourhood; and the traces of his cloven feet along the sand of the street in which the deceased resided are next morning clearly seen. I could name a case in which it is believed by a great many persons, many of them leaders in churches, that all these circumstances occurred; that the rattling of the chains was heard; that just previous to the departure of life, a seeming internal struggle was observed to take place in the body of the deceased; that a whole neighbourhood was disturbed by the clanking noise of the chains; and that crowds of persons went early the succeeding morning to view the marks of the devil's cloven feet!

One of a rather curious description of supernatural appearances of which I have heard, was a peculiar kind of apparition, which nobody seems to have seen. Its proximity was denoted by the rattling of chains (a usual accompaniment on all similar occasions), which, grating horribly on the ear, struck terror into the hearts of all believers. Its name was the 'rolling calf.' Another was a sow and ten pigs. These nocturnal visitors had the credit of viciously pursuing every person they saw in the streets after a certain hour; and hence, after such hour, very few servants could be induced to go out—a good preventive to idle gossiping and gadding about, and probably originally invented as such.

When an infant or young child is to be bathed, a tub of water is frequently placed in the sun, in order that the chill might be taken off; and this is usually done about mid-day. At twelve o'clock, however, day as well as night, 'duppies' (a negro term for ghosts) are permitted to perambulate the earth. How, then, shall they be prevented playing about, or probably bathing in the water? The sign of the cross comes to the aid of the anxious nurse or other domestic; and straightway two sticks are placed across the tub which contains the water, to scare away the duppies. Duppies are also apt to disturb children in the night-time. A Bible placed under their pillow will prove a sufficient protection; and Maunder's Treasury, in mistake for the holy book, has not unfrequently been devoted to the accomplishment of this object.

One may smile at these idle fancies. For the sake of human nature, however, he cannot but lament that they do not stop here; and that in the superstitions connected with Obeahism and Myalism, there is everything to be found that is gross, demoralising, and senseless. Obeahism seems to be but another name for witchcraft, and its practice is accompanied by many of the uncouth ceremonies which usually attended the practice of its European prototype. Like the ingredients of the witches' caldron in Macbeth, the instruments of which the Obeah man makes use for the accomplishment of his nefarious ends are a combination of many strange and ominous things. Earth gathered from a grave, human blood, a piece of wood fashioned in the shape of a coffin, the feathers of the carrion-crow, a white cock, a live serpent, a snake or alligator's tooth, and pieces of egg-

shell, are among the most common. Resort is had to Obeahism as a means of detecting crime, of influencing the affections or passions, of terrifying the timid, and of obtaining revenge. In the last light, it seems to be deducible into little less than an expert system of poisoning; and deaths innumerable have been attributed to the result of draughts administered under the directions of the Obeah man. Myalism, as far as I understand it, seems a system of counter-witchcraft, equally demoralising, and, I believe, equally pernicious; and it is but a short time since I read an account of a meeting of Myalists for the purpose of 'freeing the shadow' of one of the disciples. Laws against both Myalism and Obeahism are severe; but the enlightenment and religious instruction of the people seem alone calculated to eradicate such practices. An Obeah man sometimes makes confession on his deathbed. His confessions, it is said, often implicate parties who had previously borne respectable characters in their own sphere.

THE AFRANCESADO.*

AN EPISODE OF THE PENINSULAR WAR.

THE Levante, or south-east wind, had been blowing strongly for twenty-four hours, and the inhabitants of Cadiz had, as is usual during its prevalence, kept their windows closed, in order to screen themselves from its baneful effects; the Alameda was deserted, the Plaza de San Antonio equally so; and not a single loungee was to be seen in the gay Calle Ancha, the Bond Street of Cadiz.

The bay, too, was bereft of its accustomed animation. Generally, towards sunset, a little fleet of fishing-boats, with their large latteen sails, was to be seen returning to port; but the Levante had now confined them to the mole. The only object that met the eye in the offing was a large boat pulling across from the direction of Rota. As it approached, a horse was perceptible standing in the centre; a man was by his side; and there were four rowers; a fifth individual steered, and seemed at the same time to be keeping watch over some object lying in the stern-sheets. Suddenly the sail was hoisted, and the boat ran up the bay of Cadiz. On nearing the mole, she was hailed enthusiastically by the fishermen and others assembled there. The crew were habited like the generality of Spanish boatmen, in jackets and trousers of coarse brown cloth; wide red worsted sashes encircled their loins; and their heads were covered with woollen caps of the same colour. Their bark was similar to the larger class of passage-boats plying between Cadiz and the Isla de Leon.

The man who seemed to be the owner of the horse was of middle height, and well made; his complexion very dark, and features regular; his eyes were jet black, and piercing, and he had an enormous pair of whiskers. Under an ample brown cloth cloak, which hung gracefully on one shoulder, could be perceived his ordinary dress, consisting of a jacket, open at the bosom, but fitting closely to his athletic arms, and having several rows of silver buttons at the sides and wrists. Underneath was a cloth vest, and strapped round his waist a canana, or flexible leathern cartridge-case. He wore velvet breeches, of a dark colour, the outer seams being adorned with curiously-wrought silver buttons. On his legs were leathern gaiters, reaching to the knees, but open at the calf. His hat, or sombrero, was of coarse beaver, very low in the crown, and broad in the brim. A black silken net, with small tassels at the end, fell

from underneath this hat upon his shoulders; and he carried a long lance in his right hand.

The horse was full sixteen hands high, and of the true Andalusian breed; his small ears, fiery eyes, and glowing nostrils, were sure indications of strength and courage.

Leaning his elbow on the saddle, the guerrillero—for such he was—looked anxiously towards the landing-place, and then turning to the steersman, said in an under voice, 'Remember your charge; be firm and collected.'

At this moment the prow of the boat struck the mole; this was succeeded by a shriek, and the head of an old man emerged from the bundle at the steersman's feet. 'Misericordia! misericordia!' cried the wretched prisoner. The sailor laid his hand on the old man's mouth, forced him to lie down again, and covered him with a shabby blanket.

The guerrillero landed with the horse's bridle over his arm. The sagacious animal watched its master; and when he said, 'Venga amigo, venga!' (Come friend, come!) he sprang on shore, then shook himself, neighed, and having rubbed his mouth against his master's face, erected his crest, and seemed to invite the guerrillero to mount.

By this time a knot of persons had collected at the landing-place, some of whom attempted to get into the boat, and enter into conversation with those on board; but this the guerrillero positively forbade, making a sign at the same moment to one of the crew, who came on shore and went towards the guard-house at the Puerta del Mar, or sea-gate.

'Ho! Diego!' cried a rough-looking fellow, addressing one of the boatmen, 'what freight have you brought from Rota?'

'Nothing worth speaking of,' was the reply.

'But you have a little live stock, for we heard a pig squeak.'

'Ay, ay,' roared several voices; 'a French pig!—a French pig!—we saw its snout!'

The guerrillero was, at this juncture, preparing to light his cigar; turning to the bystanders, he said quietly, 'Is there any crime in bringing over a French pig?'

'No crime—no crime; but we know that you did not go to Seville merely to carry off a hog.'

'Diego,' cried the man who had spoken first, 'is the *puerco* of the real French breed, or only an Afrancesado?—if the latter, here is wherewithal to cut its throat?'—and he drew forth a knife, about a foot in length, ground to a point, and sharpened at both edges.

The guerrillero drew a pistol from his belt. 'My friends,' he said, 'whatever is in that boat—man or beast—is under my protection; and the first person who shall attempt to interfere is a dead man.'

The tramp of soldiers' footsteps interrupted this dialogue. There were, however, but six men, commanded by a corporal. This little guard was ranged on either side of the steps; and, on a signal from the guerrillero, two of the boat's crew lifted up the unhappy being who lay trembling at their feet, and brought him on shore. No sooner were they on the mole than a terrific howl burst from the crowd, and fifty long knives were brandished in the air.

'Down with the French hog! Death to the Afrancesado!' cried the mob.

Instantly the old man was placed between the soldiers, who marched onward. The guerrillero sprang upon his horse, and brought up the rear. Frequently was he obliged to turn round, and make a sort of charge upon the crowd, who were burning with rage, and panted to take summary vengeance on the Afrancesado, for such they now knew the culprit to be. He was, however, safely lodged in the guard-house, into which the guerrillero also entered, leaving his horse in charge of a soldier.

The appearance of the prisoner was most singular

* The author of this paper accompanies it with a letter, from which the following is an extract:—

'I was in Cadiz when the transactions described took place, and I have endeavoured to render the narrative as characteristic of the period as possible. Unfortunate Spain is now apparently on the eve of a sanguinary reaction in consequence of the proceedings of the modern Afrancesados, towards whom the same feeling of animosity on the part of the majority of the Spanish people still exists, as was displayed during the memorable Peninsular war.'

He was rather under the middle size, and seemed to be about sixty years of age. He was dressed in a full suit of black, with silk stockings, and rich buckles in his shoes; but his whole costume was so covered with dust and mud, that he had somewhat the air of one of those itinerant mountebanks who are to be seen in France at country fairs. The lace frill was torn and dirty; his gray hair fell in scanty meshes about his ears; and he endeavoured to conceal his face with his right hand, on the fore-finger of which shone a valuable diamond ring.

The officer on guard had been previously informed by the boatman who the prisoner was; and he now communed apart with the guerrillero as to the most eligible mode of getting him conveyed to the jail, which is situated at a considerable distance from the sea-gate. It was by this time quite dark, and the officer expressed his apprehensions lest the populace should gain possession of the captive, and sacrifice him.

'Senor,' said the guerrillero, 'I alone brought the old sinner all the way from Seville; and, aided by half a dozen soldiers, I will engage to lodge him securely in the prison.'

'Be it so,' replied the officer; 'sergeant, take six of your best men, and accompany this brave fellow and his prisoner: let no one approach them.'

The old man now fell on his knees before the officer: 'Misericordia! misericordia!' he cried; 'for the love of God and of the blessed Virgin, save me from the fury of the rabble!—let me remain here!'

The appeal was fruitless; the officer bade him rise, but the poor creature seemed incapable of doing so. The guerrillero lifted him up, and carried him, in almost a state of insensibility, to the door of the guard-house; the escort was in readiness, and in the twinkling of an eye the bold horseman placed the little old man on the saddle-bow, and mounted himself afterwards. Encircling his prisoner with his left arm so as to be able also to hold the bridle, he seized the lance with his right hand. The sergeant and two men were placed before the horse, a soldier on either side, and two others behind.

No sooner had this singular cortège appeared, than a fearful murmur issued from the market-place, close to the sea-gate, and where a considerable crowd had assembled. As the party advanced, it was so strongly pressed upon by the infuriated mob, that the soldiers had much difficulty in opening a passage.

The old man's head fell upon his breast, and he trembled so violently under the muscular arm of the guerrillero, that the latter was obliged to press him still closer to his body, in order not to lose his equilibrium.

'Maldito Afrancesado!' shrieked the crowd.

'Yes; accused be the old monster!' bawled an athletic butcher, brandishing a hatchet with a short iron handle; 'down with him! Hark'ee, Senor Guerrillero, deliver up your prisoner, or we'll force him from you.'

'Never!' replied the brave horseman. 'Sergeant, I rely on you and on your men to keep off the mob.'

At this moment a rush was made by several men, armed with large knives. The soldiers in vain offered resistance; their muskets were wrested from their hands before they had time to make use of them.

The guerrillero now wheeled round; then making his horse plunge, and wielding his lance like a knight of the olden time, he succeeded in clearing a space before him. Galloping across the market-place, he reached the narrow street leading to the prison, which is within a stone's-throw of the barracks; but he had not advanced far before his passage was barred by another mob, whilst his former antagonists closed again on his rear.

'Amigos,' cried the guerrillero, 'I would not willingly harm any of ye, nor do I think you would wish to injure me; however, not a hair of my prisoner's head shall be touched by you whilst I exist. I have brought this infamous culprit at the risk of my life from the very head-quarters of the enemies of my country; he will be tried by the law of the land, and assuredly will

not escape the punishment due to his crimes, *but he must not be assassinated.*

There was a short pause after this address. During the momentary calm the horseman managed to advance a few paces, and had reached the corner of a short street leading to an open space near the jail, when a shriek of 'Vengeance! vengeance!' issued from the crowd, and a woman rushed forth.

'Tis the mother of Antonio,' said a ferocious-looking fellow; 'Antonio, who was sentenced to death by this infamous Afrancesado, and was executed at Seville. Blood for blood! Come, Senor Guerrillero, give up your prisoner quietly; we are resolved to have him.'

'Misericordia! misericordia!' cried the terrified old man.

'No mercy! no quarter! we'll tear thee limb from limb!'

'Vengeance! vengeance! the blood of my murdered child cries for vengeance!' screamed the woman.

The guerrillero now let his lance swing loosely from the strap to which it was attached to his arm, and drew a pistol from his breast. A lamp that was burning before the image of a saint at the corner of the street shed a faint light upon his figure, and enabled the mob to see his actions. Pointing the pistol at the person nearest him, he repeated his former manoeuvre, cleared the way by means of his horse, and though still closely beset by the mob, was making some progress towards a more open spot, when he was once more hemmed in.

At this crisis, a lad of about twelve years old crept under the horse and cut the saddle-girths; this startled the noble animal, who bounded forwards; the movement caused the saddle to turn round, and the rider, with his trembling burden, fell to the ground.

At the commencement of the turmoil, a respectable individual who happened to be on the spot ran to the barracks hard by, and described the perilous situation of the guerrillero to the officer on duty, who, at the head of a few soldiers, hastened to the point indicated by the stranger. They arrived just as the guerrillero fell from his horse, and forcing their way through the crowd, succeeded in rescuing him and his prisoner, and escorted them to the jail, where the latter was safely lodged.

Don Cayetano —, the son of a rich merchant of Cadiz, had been educated for the law, and rose to the dignity of a judge, which position he occupied with perfect credit to himself, when the royal family of Spain were inveigled away by the intrigues and hardihood of Napoleon, and a puppet king, in the person of the brother of the French emperor, was sent to take their place at Madrid. When that revolution was brought about, a few Spaniards, some of whom were actuated by mistaken political views, others by a regard to their own interests, professed adherence to the French interest, or became, in the language of the country, *Afrancesados*: the bulk of the nation, I need scarcely say, beheld the French and the intruso-king with deep-seated indignation, inasmuch that even in Cadiz, under the protection of a British garrison, it would have been dangerous for any one to be heard speaking a French word.

Among the military officers and courtiers who came with Joseph to Madrid, were two whom Don Cayetano had known many years before, when he visited Paris, and appeared at the court of Louis XVI. The old companions met, and, after the usual remarks on the charges which had taken place in their personal appearance since they had last seen each other, they naturally began to talk of politics. Don Cayetano did not hesitate to express his detestation of the unjustifiable part which Napoleon had played, and his conviction that his influence would ultimately be extinguished in Spain. The two French functionaries smiled at his 'prejudices,' and endeavoured very mildly to argue him out of them. Other meetings took place. The ex-judge—for such he had been since Joseph's arrival—kept aloof from

court; but he did not deem it necessary to avoid the society of his old friends. In time, they found his weak side, a desire of reforming the laws. They also discovered that he was not without a little vanity. The man, therefore, whom wealth unlimited could not have induced to do a dishonourable action, was overcome when the prospect was held out to him of acquiring a name as the regenerator of the civil and criminal jurisprudence. He consented to accept a place on the bench under Joseph, and thus became—fatal word—an *Afrancesado*.

The head-quarters of the French army of Andalusia were at this time at Seville, and a strong division under Marshal Victor was besieging Cadiz. Serious interruptions to the operations of the French were constantly occasioned by the guerrillas, whilst conspiracies of various kinds were on foot at Seville and its vicinity to free the country from the iron yoke of the invaders. The severest measures were adopted by them to counteract these plots; and Don Cayetano, after swearing fidelity to King Joseph, was directed to proceed to Seville in his judicial capacity.

Great confidence was inspired by his well-known energy and penetration; and, as is usual in such cases, the renegade became remarkable for his severity. Numbers of Spaniards were condemned to death by the *Afrancesado* judge, and his name was execrated throughout Andalusia. He became completely infatuated with the French, probably because he knew that his existence depended on their success; and it appeared as though he endeavoured to lull the pangs of remorse by plunging into the vortex of gay society. He attended all the grand parties given by the French authorities, and, in his turn, invited them to splendid entertainments. An observant eye might, however, have discovered in the countenance of the *Afrancesado* evident marks of deep anxiety, and the wearing effects of a smiting conscience.

A short time before the scene we attempted to describe at the commencement of this tale, he had condemned to death a brother of our guerrillero, whose only offence was, that, having quarrelled with a French subordinate civil officer, he had, in the heat of passion, cried out, 'Viva Fernando Septimo! muera José!' He was thereupon seized by the police, dragged before the judge, who passed sentence of death on him, as having been guilty of *treason*; and the unfortunate young man was forthwith executed.

When this sad intelligence reached the brother, he vowed vengeance against the *Afrancesado* judge. His method of attaining his object was singular and characteristic. 'I will not soil my hands with the blood of the base murderer,' said he; 'but I will carry him off in the blaze of his infamous splendour, and take him to Cadiz, his birthplace, and the seat of the regency governing in the name of Ferdinand the Seventh. There he cannot fail of being condemned to death, after being judged as justly as he has judged others unjustly.'

The guerrillero was at this time in the mountains of Ronda, where he did his part, in common with others, in harassing the French. He had a thorough knowledge of all the by-paths in Andalusia, and had frequently gone over to Cadiz with despatches to the Spanish regency from the guerrilla chiefs. He was acquainted with some fishermen who lived near a little creek in the vicinity of Rota, and who had more than once taken him over, keeping his horse for him until his return. He now made the best of his way to their humble dwelling, and obtained a passage to Cadiz, where he had some relatives, who were market boatmen, and upon whose hearty co-operation in avenging his brother's death he well knew he could reckon.

The plan was soon agreed upon. His three kinsmen and two others were to go in their large market boat, on the following night, to the little creek near Rota, and there await the arrival of the guerrillero; who, immediately after this arrangement was made, returned with the fishermen to the other side of the bay. Mounting his gallant steed, he took the road to Seville, where

he arrived on the evening of the second day. He could have reached that city in a less space of time, but he was anxious to keep his horse fresh, well knowing that he must soon tax his strength to the uttermost. Having carefully examined his pistols, he entered the city after dark, and rode up to the judge's house. It was brilliantly lighted up; for Don Cayetano gave a grand entertainment that evening to the French general-in-chief, his staff, and a numerous party of *Afrancesados*.

The guerrillero held in his hand what appeared to be an official despatch, sealed up, as usual, in an envelope of large dimensions. He dismounted, and knocked loudly at the handsome gateway. A servant, in rich livery, quickly appeared, and demanded his business.

'I have a despatch for his excellency the judge.'

'Very well,' said the domestic; 'give it to me, and it shall be handed to him immediately.'

'My orders are to deliver the packet into the judge's own hands.'

'He is just now engaged with a large party, and I dare not disturb his excellency.'

'Then I will,' said the guerrillero, 'for the despatch has been forwarded with the utmost speed from Madrid; and when it was handed to me by the governor of Carmona, he commanded me not to give it to any one but the judge himself.'

The guerrillero then made a movement to penetrate into the courtyard; but the servant, convinced by the earnestness of his manner, and by the mention of the governor of Carmona's name, undertook to speak to his master.

'Make haste,' cried the guerrillero, 'for I am tired, and so is my horse. Tell his excellency that if he will just step out, 'twill only be the affair of an instant. All I want is to accomplish my mission, and make the best of my way back.'

Whilst this scene was passing outside the mansion, the guests, who were assembled in its superb apartments, were diverting themselves in various ways. In one saloon dancing was kept up with spirit; the French officers displayed their accustomed elegance in the ball-room, the Spanish *senoritas*, graceful and enchanting as they are at all times, being peculiarly animated; and many tender conversations were held between the youthful French gallants and the lovely Andalusian damsels. In another room gambling was carried on with great avidity. Around the *monte* table were seated several grave-looking Spanish gentlemen and ladies beyond the meridian of life, all intent upon the game. Behind them were numbers of French officers, among whom were mingled several of the beautiful girls from the ball-room, playing in partnership with the warriors; and it was painful to observe the intensity with which those fair creatures watched the chances, gloried in their winnings, or deplored their losses.

In a spacious and splendid saloon were assembled the French general-in-chief, and a number of his superior staff officers, the Spanish authorities acting under the French *regime*, various other Spaniards, and their hospitable host, the *Afrancesado* judge. They were in full conversation when the servant entered, and in an under tone informed his master that a horseman was at the gate bearing a despatch from the governor of Carmona, which he was ordered to deliver into the judge's own hands. The old man at first desired that the messenger might be sent up stairs; but the servant having told him that he did not seem to like to leave his horse, the judge quitted the saloon, descended the grand staircase, crossed the courtyard, and advanced to the gate. There stood the guerrillero with the packet in his hand: as the old man held out his to receive it, the guerrillero grasped his arm, dragged him over the threshold, lifted him in a second on to the pommel of his saddle, then vaulting into it himself, galloped off at full speed, covering the judge's mouth with one hand to prevent him from crying out, and was clear of the city before the alarm could be given; for the servant who had accompanied his master to the gate was so astounded by what he had

witnessed, that he did not recover his faculties till several minutes afterwards.

As soon as the French general was informed of what had taken place, parties of cavalry were despatched in pursuit of the guerrillero, but without effect; he had leaped his noble horse over a broken wall, distant from the sentinels, and had struck at once into paths unknown to the French cavalry, and where they would hardly have ventured to follow him, had he been seen to enter them. Rapidly, and without obstacle, did the guerrillero return to the little creek near the Guadalquivir; he found his faithful companions on the alert, embarked in the long market boat, having first deposited his trembling charge in the stern, and placed his horse amid-ships. His arrival at Cadiz has been already described.

The proofs of Don Cayetano's guilt were too numerous and too notorious to require any lengthened process—he was condemned to be strangled.

At that period the monks and friars still possessed great influence in Spain; and the relatives of Don Cayetano, who were in Cadiz, used every exertion to obtain a prolongation of the customary time between the sentence and its execution, in the hope of effecting his escape by means of great pecuniary sacrifices, and through the instrumentality of the priesthood. The superior of one of the convents was accordingly applied to, on the plea, in the first instance, of obtaining the spiritual services of one or more of his community for the condemned judge. By degrees, and with caution, it was afterwards intimated to the superior that a very large sum would be at the disposal of whomsoever might insure his escape. The hint was at first but slightly attended to: shortly afterwards, however, the friends of Don Cayetano were informed that, for the moment, all that could be done was to retard the execution of the sentence, on the ground that the guilty man's mind required a lengthened pious preparation and repentance, before that absolution could be granted to him which was necessary for the future welfare of his immortal soul. To obtain this respite a large sum was required—it was instantly paid.

Nearly two months passed away in anxiety on the part of the captive and his friends, and in promises and demands for more money on that of the superior of the convent, who declared that he was paying the way for the judge's escape. How he managed to induce the authorities to sanction the delay is beyond our knowledge. Certain it is, that at length every pecuniary resource within the reach of Don Cayetano's connexions became exhausted; and the monks at the very same time evinced a mysterious doubtfulness as to the issue of their negotiations. In their visits to the prisoner, they dwelt solely on religious matters, admonishing him, above all things, to prepare for the worst, and returning vague replies to his anxious questions relative to his escape or pardon; the same manner and language were observed towards his now empty-handed friends during their interviews with the holy fathers.

Murmurings faintly arose about this time among the lower classes, like the distant moanings of the ocean preparatory to a violent storm. Gloomy and uncouth men, and fearful-looking women, hovered about the fishermen after they had moored their boats in the evenings; and the name of Cayetano, the French hog, as they termed him, was pronounced with vengeful tone and gesture. Night after night these symptoms of popular fury were exhibited, augmenting hourly in intensity. By what means the irritation of the lower classes, as described at the commencement of our narrative, had been so long repressed, was a matter of surprise to all who reflected on the circumstance; the mother and brother of the deceased Antonio were still in Cadiz, and it could not be doubted that they continued to be animated by the most ardent desire for vengeance on the judge.

The fact, however, was, that the monks had, up to this time, exercised their powerful influence over the

minds of the people, who, at their bidding, had remained tranquil; but the object having now been obtained—the possession of the property of the aged culprit, and of all the available resources of his friends—they had no further inducement to inculcate forbearance; at least this was strongly suspected to be the case. The pent-up passions of the mob were therefore allowed to burst forth with redoubled force, and carried all before them. In front of the jail, before the houses of the magistrates, at the military barracks, crowds assembled continually, preceded by Antonio's mother and brother, demanding the execution of the sentence passed upon the hated Cayetano. The Spanish soldiers also sympathised in this fiery wrath against an Afancesado: his execution, therefore, became inevitable.

The civil authorities now applied to the superior of the convent to report upon the spiritual condition of the prisoner. He no longer hesitated, but declared that he was in a penitent and edifying frame of mind, fit for absolution, and that this was a favourable moment for the condemned judge to pay the penalty of his worldly offences. The warrant for carrying the sentence into execution in thirty-six hours was accordingly signed.

The wretched Cayetano, seated in a corner of his cell, was pondering over his awful situation, and overwhelmed with dire presentiments occasioned by the altered manner of his reverend attendants, when the massive bolts were slowly withdrawn, and the usher of the criminal tribunal entered. He was rather a portly personage, dressed in a full suit of black. In his left hand he held a scroll of parchment; and advancing with noiseless step towards the prisoner, who regarded him with piercing eyes, bowed ceremoniously, and said, 'God guard you, señor!'—and slowly unrolling the parchment, thus addressed the careworn culprit:—'In pursuance of the decree of the competent authorities, I am about to perform the painful duty of reading to you the warrant for the fulfilment of the sentence of death pronounced against you.

The prisoner neither spoke nor moved.

The usher having read the warrant, retired. In a few minutes the jailer entered, followed by two assistants, and conducted the captive to the place where he was to pass the few remaining hours of his existence.

During the period that a condemned criminal is in *capilla*, as it is termed, he is not only attended by a priest, or priests, for the purpose of affording him spiritual consolation, but every bodily comfort is placed at his disposal. Of neither of these advantages, however, could the old judge be persuaded to avail himself. He remained seated on the little bed, his head drooping on his chest, and totally regardless of the orisons and exhortations of the two monks by whom he was constantly attended. In this state he remained until the hour appointed for his execution.

It was a fine spring morning; the vivifying rays of the sun enlivened and beautified the face of nature; but this very brilliancy produced a melancholy feeling, for it was also a morning on which a human being was to perish on the scaffold. At dawn, a small table, covered with black cloth, was to be seen at the gate of every church in Cadiz. On this table were placed a crucifix, and a wooden box with a chink in the lid. At each end of the table stood a member of one of the Hermandades, or religious societies, covered with a silken cloak, the colour whereof designated the Hermandad, or brotherhood, to which he belonged, soliciting alms from the passers-by. This appeal was complied with even by the very humblest, the product being destined to pay for masses for the repose of the malefactor's soul.

The hour fixed for the execution was noon—the spot a rising ground on the *campo*, not far from the jail. A platform about six feet from the ground had been erected; it was reached by a few steps formed of rough planks. From the centre of the platform rose a post, jutting out from which was a narrow fixed seat; a

groove or alit was perceptible in the middle of the post. From an early hour crowds of persons emerged from every street, and hastened to this spot, which was guarded by a body of troops; the people were ranged on the rising ground, as in an amphitheatre, a space being kept clear by the soldiers between the spectators and the platform, as well as a passage thence to the jail. As the appointed hour approached, the crowd became tremendous; for, independently of the anxiety that is common in every part of the world to obtain good places at those spectacles which justice presents gratis to the people, the inhabitants of Cadiz were on the present occasion animated by a most ferocious curiosity, and by a determination to be able to certify—after ocular proof—to the ignominious death of the Afrancesado judge: they would even have revolted against the government had an attempt been made to deprive them of their prey. Grievous and appalling it was to see this compact mass of infuriated people waiting impatiently to gloat over the moral and physical agony of a fellow-creature!

In the midst of this horrible excitement, when all were speaking and gesticulating in that expressive and energetic manner peculiar to Spaniards, the bells of all the churches began to toll: the effect was most extraordinary. Instantaneously there was dead silence; every man bared his head, and the whole multitude noiselessly, but with moving lips and downcast eyes, appeared absorbed in prayer. This lasted for a minute or two, and then the shouts, and cries, and gestures became more violent than ever.

Precisely at noon the gates of the jail were thrown open: the bell of the prison-chapel tolled, and the lugubrious sounds were echoed from all the church-towers. The melancholy procession now emerged from the prison gate. First came a penitent, masked, and wearing a long loose robe of coarse brown cloth, tightened at the waist by a broad leathern belt; his head was overshadowed by a cowl: he carried a moderate-sized bell in his right hand, and sounded it three times at each tenth step; it had a cracked and sickening tone. He was followed by another man in a similar costume, bearing a large silver cross, and attended on each side by an acolyte, carrying a yellow torch; afterwards came six masked penitents, two and two.

The judge now appeared; and a howl, the horrible effect of which it would be in vain to attempt to describe, issued from the excited mob. The poor creature was bare-headed, and wore a long loose brown greatcoat; his hands were tied with cords. His head was bent towards the ground, and it was with difficulty that he could be prevented from sinking. On one side of him was a priest, who frequently held a crucifix close to his withered face, and seemed to be exhorting him to repentance: another priest recited the prayers for the dying. The procession was closed by several members of the different Hermandades, or religious associations, and mounted alguazils, protected by the military.

The executioner had been for some little time on the platform with an assistant. He was a tall spare man, wearing a close-fitting black vest, breeches of the same colour, white cotton stockings, and dress shoes; the cuffs of his vest were turned up. He had been fixing an iron collar on the post at the back of the seat, and behind the same was a spindle, like that of a vice, made of polished iron. A few cords were lying at this man's feet; and as the procession advanced, he was amusing himself by twirling round the bright spindle, to ascertain, apparently, whether it would work glibly.

On reaching the foot of the platform, the aged and sinking culprit stood for some minutes at the bottom of the steps; the priest seemed to be earnestly exhorting him, but the poor man took no notice. He was then helped up the steps, backwards, by the executioner's assistant, the priests following, and holding the crucifix close to his face. Soon he was seated across the stool; the iron collar was slipped over his head; the executioner twirled the spindle, screwed it twice, and all was over.

The crowd rapidly dispersed, a few soldiers being left to guard the body, which remained in the sitting posture just described until about sunset, when the members of one of the Hermandades, accompanied by a priest, performed, as usual, the pious office of placing it in a coffin, the priest repeating the prayers for the dead. The coffin having been placed in a black covered cart, drawn by a sorry mule, the modest procession proceeded slowly to the Campo Santo, or public cemetery, at a short distance outside the walls of Cadiz, where the remains of the Afrancesado judge were deposited in a humble grave.

PERIPHRAISIS.

'PLEASE, papa,' inquired Robert, taking his eyes from a book he was studying, 'what is periphrasis?'

It is well known that there is nothing so difficult as off-hand definition, and my son's question placed me in rather an awkward predicament: I did not choose to risk a random explanation of the word, for fear of misleading him; while to remain silent would cause him to suppose me ignorant of that which I well knew, though not able to define it at a moment's warning. This is one of the little difficulties in which children sometimes place us. I tried to get out of the present dilemma by delay; I went on writing, in which I appeared too much absorbed to hear what he had said; but was all the time mentally framing an answer to his question. After watching anxiously till I came to a full stop, he hoped I would not be angry for disturbing me, adding, 'But what, papa, is periphrasis?'

Still, I was not quite ready with a proper reply; and after slowly laying down my pen, and gaining an instant or two by a sort of heaving cough, I found myself quite at a loss to invent another instant's delay, and plunged desperately into the subject. 'Periphrasis, Robert, is—that is to say, it comes from two Greek words, *peri*, about, and *phrasis*, speech.'

'Yes, but what does it mean, papa?'

'Why, it signifies a figure of speech much in use among orators, poets, newspaper-writers, and indeed, now I think of it, more or less by everybody in common conversation, to express, in a great many words, what they could say in one. For instance, I use the figure of periphrasis when, instead of speaking of you as "Robert," I say "my youngest son."'

'Then I suppose,' remarked the observant little rogue, after a little reflection, 'when mamma, in alluding to Mr Ammerton who comes here so regularly, calls him a "certain young gentleman," it is periphrasis that makes sister Clotilda blush so?'

'Perhaps it is,' I remarked, trying to look grave.

'Yes, but why does mamma call him so? why does she not say Mr Ammerton at once? I want to know, papa, what is the use of periphrasis?'

I explained as well as I could the uses of that figure in poetry and in rhetoric; but when the persevering young gentleman would know the various uses to which it is put in ordinary conversation and everyday life, I told him he might go and bowl his hoop; for though the question suggested a long train of thought, my reflections were of a nature not to benefit his inexperienced mind. Perhaps older readers may, however, be amused by them.

Of all the graces of rhetoric, none is so largely, or perhaps so usefully employed, in every grade of society, from the cottage to the crown, as periphrasis. In literature, it is said to sweeten and ornament a discourse carried on in propriety of language: so in our personal intercourse with mankind, its judicious employment softens asperities, dilutes expressions when they are becoming too strong, and blunts the edge of personality when it is going to be too pointed. But there is, alas! no use without its abuse; and unfortunately this elegant trope is occasionally turned to very bad account. The fact is, when pressed into the service of scandal, it is a tremendous anaphora.

While discussing the subject in my own mind in its domestic relations, it was natural that my son's allusion to my excellent partner (I use this periphrasis in all sincerity; for, despite a few peculiarities, a better wife, a better mother, or a better housekeeper than Mrs Parkinson nowhere exists) should remind me of the constant use she makes of the branch of rhetoric we are considering. If she has anything in the least degree unfavourable to communicate of any person, it is extremely difficult to draw from her actual names: her favourite periphrastic substitutes being either 'some folks' or 'certain parties.' 'Some folks,' she remarked the other day, 'should, I think, be a little more circumspect regarding their daughters, especially being paragonage folks. Certain parties, who shall be nameless, were seen yesterday walking with certain other parties—alone—when, too, it was nearly dusk. To be sure people who have, poor things, only one daughter married out of four, can be forgiven a little latitude in that respect.' Now, by this round-about method of communication, Mrs Parkinson made herself unintelligible to our guest from London, who happened to be present; while I was as perfectly in possession of her meaning as if she had said outright that the Goodsons, mother and daughter, were alluded to. In like manner, I can always tell on what terms my wife happens to be with them, or indeed with any of our neighbours, by her different modes of designating them. When a little 'tiff' has happened, the Reverend Mr Goodson and family are designated 'the people at the end of the village.' Should, however, Mrs Parkinson be speaking in praise of them—detailing, for example, any of Mrs Goodson's numerous acts of charity—she calls her 'that dear woman at the parsonage.' In short, Mrs Parkinson—like many others whom my readers will be able to point out amidst their own respective circles—is afflicted with a very great dread of 'mentioning names,' for fear, as she diplomatically observes, of 'compromising herself.'

I am, however, inclined to think that domestic life is not the soil in which our favourite flower of rhetoric flourishes best. To see it in its highest perfection, we must take a glance at the learned professions and the legislature. I select my first instance from the pulpit, because it happened to furnish me with a bit of judicious periphrasis, which had a most beneficial effect on Mrs Parkinson. To say the truth, her prevailing foible is love of dress, and I almost blush to add that she used to select the least appropriate day in the week for indulging it; consequently she and Clotilda seldom entered church till after all the rest of the congregation had assembled, to their manifest disturbance. The Reverend Mr Goodson had already complained to me of the annoyance, and I had communicated my views on the subject to my wife in terms much too strong to admit of any periphrasis whatever. Still, Mrs Parkinson would not be warned, and continued to arrive in the midst of the service. As a last resource, therefore, our reverend pastor made a pointed allusion from the pulpit. The subject was, lukewarm Christians considered as more effectual enemies to Christianity than confirmed sceptics. The accomplished preacher pointed out the various descriptions of this character, till at last he came to the class in which I felt sure my wife was included. 'Of these, my brethren,' continued the preacher, 'there are some who, when all is silent save the voice of the pastor, announce their presence by the rustling of silks and the streaming of ribbons.' Nobody could mistake to whom this periphrasis applied; for the preacher cast a side-glance at my wife, which acted as a conductor to the eyes of the whole congregation, and they were concentrated on the same focus. Mrs Parkinson blushed as pink as her bonnet, and from that day never entered late, or otherwise than plainly attired.

Passing the learned professions, in some of which periphrasis is carried to an extent more tedious than amusing, I must invite my readers to seats in the Houses

of Parliament, for there periphrasis reigns in all its glory. In these great assemblies, to refer to persons by their actual designations is strictly forbidden. 'The honourable member for Rumbleborough,' or 'the honourable and gallant member,' or 'honourable and learned gentleman,' according as a military or legal senator is indicated, must serve in the Commons for all more precise appellatives. This does tolerably well; but, in the Lords, where men, as members, have no local habitation any more than they have a name, much more difficulty is experienced. This is best illustrated in a 'reply.' After a certain peer has made a motion, the other lords deliver their opinions for and against it; and when all have spoken, it is usual for the mover to reply to the several arguments. The periphrastic shifts he is put to in designating the various orators are sometimes really distressing. If two bishops have spoken, one is the 'right reverend prelate who took an early part in the debate,' and the other, 'the right reverend prelate who usually votes with the ministry'; then comes a bit of logic for 'the noble and learned baron on the cross-bench,' succeeded by an exposure of the fallacies of 'a noble viscount on the opposite side of the house,' with a cordial eulogy on the clear-sighted views propounded by 'the noble lord on the woolstack.' The further the orator proceeds, the poorer he naturally gets in his periphrases, till towards the end he is reduced to 'the noble lord who preceded the last speaker,' or 'the noble and gallant duke who addressed to their lordships a few pithy sentences previous to the noble lord who preceded the last speaker.' Finally, he comes to the oft-mentioned last speaker himself, who is designated either as 'the noble lord who has just sat down,' or as 'the noble lord who was last on his legs.' It is obvious, that exactly as Mrs Parkinson's bit of scandal was quite unintelligible to our stranger guest, so the debates in the House of Lords would be almost Greek to the public if they appeared in the newspapers exactly as they are conducted. The reporters, however, render them intelligible by inserting within parentheses the actual names of the peers so mysteriously and circuitously alluded to. A few periphrases are common to both houses; the most striking being the circumspection with which the name of the sovereign is avoided. She is hinted at as the throne, the crown, or an illustrious personage; and when some bold debater wishes to be very personal indeed, he speaks of 'the highest personage in the realm.' I do really believe that the utterance of these widely-charished words, 'Queen Victoria,' in the House of Commons, would cause as extraordinary a sensation as was created by the Irish reporter who amidst the gravest silence called on the speaker 'for a song.'

It seems also to be held as highly improper for any person to talk of the 'House of Lords' in the one place, or of the 'House of Commons' in the other; each assembly being delicately shadowed forth as 'another place.' Nay, this etiquette is carried to an almost boundless extent; for, in mentioning an occurrence which may have happened anywhere else than in either of the 'other places,' or Houses of Parliament, the expression to be used is 'out of doors.' Thus the legislative wisdom of this country divides the terrestrial globe into two sections: that which is comprised 'within doors,' and that which exists 'out of doors.'

The gentlemen of the press—a pleasing periphrasis for reporters—luxuriate in the figure even more than orators. I am tempted to believe that this arises from the fiscal arrangements of newspaper proprietors, who remunerate a certain class of writers at so much per line. It is obviously, therefore, the interest of the reporter to convey a single fact in as many words and lines as possible: hence he adopts the circumlocutory or periphrastic style of composition, in order to blend elegant diction with pecuniary profit. Supposing, for example, he hears that old Lord Stalkington has proposed marriage to Alderman Crumpe's youngest daughter; that information, conveyed in so many words, would not only prove extremely uninteresting to his readers,

but very unprofitable to himself. He therefore spreads out this inch of fact into a foot of paragraph, somewhat after the following fashion:—

'APPROACHING MARRIAGE IN HIGH LIFE.—It, is rumoured in the fashionable circles, that an earl of recent creation—whose laurels as a general officer were won in the Peninsula, and who held office under a late administration, but resigned on the breaking up of that cabinet—is about to lead to the hymeneal altar the lovely and accomplished daughter of an opulent city alderman, who not long since passed the civic chair with the marked approbation of his fellow citizens. Though the noble lover has passed the grand climacteric, and the fair intended is in the early bloom of womanhood, yet the alliance is said to be purely one of affection on both sides. The dower of the future countess is said to be immense.'

Upon this principle it is seldom that, in newspapers, things or persons are called by their ordinary names. Fire is the destructive element; dancing, tripping it on the light fantastic toe; drowning, finding a watery grave; eating, the pleasures of the table; drinking, sacrificing at the shrine of Bacchus. Barristers are gentlemen of the long robe; actors, votaries of Thespis; shoemakers, sons of St Crispin; tailors, knights of the thimble; doctors, disciples of Esculapius. Soldiers are all gallant sons of Mars; and every sailor is a son of Neptune.

By the time I had written thus far, Robert rushed into the room with the intelligence that poor Clotilda had been seized with another fit of periphrasis; for a 'certain gentleman' had just arrived, bringing with him his father and lawyer. 'Bless me,' I exclaimed, wiping my spectacles, and ringing for my dress-coat, 'I had forgotten all about Ammertown and the marriage settlement.' This effectually awoke me from my reflections; for if there is anything calculated to end a reverie concerning periphrasis, it is a law-deed.

BOYD'S HISTORY OF LITERATURE—ORIGIN OF TIME RECKONINGS.

Two volumes out of four have appeared, of a 'History of Literature, or the Progress of Language, Writing, and Letters, from the Earliest ages of Antiquity to the Present Time; with a View of the State of Science and the Fine Arts'; the author being Sir William Boyd, M.D. The second volume terminates with the Augustan age of Rome. Without pretension to any brilliant originality, this work appears to us to present a very fair and judicious view of the progress of letters amongst mankind; the biographies of writers, and criticisms on their writings, are generally spirited, and the specimens of classic productions of celebrity are for the most part ably translated. For youthful study, we do not know a book upon the same subject calculated to be equally useful.

On a perusal of the work, it has appeared to us that none of the purely literary notices could be so appropriate for quotation in this place as the brief view which the author gives of the origin of time reckonings, a subject which comes under his attention in treating of the history of astronomy among the ancients. 'Days, years, months, the sky, the constellations, &c. are,' he says, 'ideas which common and uncultivated minds possess; nevertheless these are the elements of astronomy. The notion of a day is obviously and constantly impressed upon man in every condition in which he is placed. The recurrence of light and darkness, of warmth and cold, of noise and silence, of activity and repose, makes the notion of a day necessarily occur. A year is a notion formed in a similar manner, implying the idea of recurring facts, with the faculty of arranging them in time, and of appreciating their recurrence. The notion, however, of a year, though obvious, is, on many accounts, less so than that of a day. The repetition of similar circumstances at equal intervals is far less mani-

fest, and the intervals being much longer, an exertion of memory becomes requisite in order that the recurrence may be perceived. Nations generally have marked this portion of time by some word having a reference to the returning circle of the seasons. The Latin *annus* signifies a ring, and the Greek term *ενιαυτος*, means something which returns into itself. To make the term year imply a fixed number of days, it is necessary to know how many days the cycle of the seasons occupies, a degree of knowledge beyond what has been already alluded to; and men cannot reckon as far as any number approaching that of days in a year, without possessing a system of numerical terms, and methods of practical numeration, on which such a system is founded. Among the Greeks the seasons were at first only summer and winter; the latter included the wet and cold portion of the year.

The sun goes through his cycle of positions in the same period that the stars go through a cycle of appearances belonging to them: and it appears that the latter were also carefully observed to determine the exact length of the year. Several of the groups of fixed stars are readily recognised, as exhibiting always the same configuration, and stars particularly bright become more prominently objects of attention. These are observed at particular seasons to appear in the west after sunset; it is remarked, however, that when they do this, they are found nearer and nearer to the sun every successive evening, till they become invisible by his light; it is also observed, that at certain intervals after this, they rise before the dawn of day rending them imperceptible, and afterwards they rise at a longer interval before the sun. The risings and settings of the stars under the above circumstances were, in countries where the sky is usually clear, a great help in marking the various seasons. Thus, the rising of the Pleiades in the evening was an emblem of the approach of winter; the rising of the waters of the Nile coincided with the heliacal rising of Sirius: even without an artificial division of time, it was not impossible to carry observations of this kind to such a degree of accuracy, as to learn from them the number of days which compose a year, and to fix the season from the appearance of the stars. By such means it is said to have been determined that the year consisted at least of nearly 365 days. We are told by Herodotus that the Egyptians claimed the honour of this discovery; and the priests informed him that they were the first who divided it into twelve equal parts, or months, consisting of thirty days each, and that they added five days more* at the end of the year, and thus the circle of the seasons came round. It appears that the Jews at an early period had a similar method of reckoning time; for the deluge is stated to have continued 150 days,† from the 17th day of the second‡ month, to the 17th day of the seventh§ month; that is, five months of thirty days. A year thus settled as a period of a certain number of days, is called a civil year, and is one of the institutions of states possessing any degree of civilisation; and one of the earliest portions of systematical knowledge is the finding out the length of the civil year, so that it may agree with the natural year of the seasons. By such a mode of reckoning, however, the circle of the seasons would not come round exactly; the actual length of the year is very nearly 365 days and a quarter; so that if a year of 365 days were used, in four years the year would commence a day too soon, when considered with reference to the sun and stars; and in sixty years it would begin fifteen days too soon, a number perceptible to even a loose share of attention. Various contrivances were used to keep the year correct. The method which we employ, consisting in counting an additional day at the end of February every fourth, or leap year, is an

* Syncellus says that, according to the legend, it was King Aethio who first added the five additional days to 360 for the year, about 1800 A.C.

† Genesis, c. vii., v. 24.

§ Genesis, c. vii., v. 11.

example of the principle of intercalation, by which the correction was more usually made. Methods of intercalation for the above purpose were found to exist in the new world; the Mexicans added thirteen days at the end of fifty-two years. The plan of the Greeks was more complex, by means of a cycle of eight years, which had the additional object of accommodating itself to the motions of the moon. The Egyptians, on the other hand, knowingly permitted their civil year to deviate at least so far as their religious ceremonies were concerned. According to Geminus, they did not wish the same sacrifices to be made always at the same time, but that they should go through the various seasons, in order that the same feast might happen in summer and winter, in spring and autumn. There were other nations that did not regulate their civil year by intercalation at short intervals, but rectified it at long periods when considered necessary. The Persians are said to have added a month of thirty days every 120 years. The Roman calendar, at first rude in its structure, was reformed by Numa, and was directed to be kept in order by the constant interposition of the augurs. This, however, was from various causes neglected, and the reckoning fell into complete disorder, in which state it was found by Julius Cæsar. By the advice of Sosigenes the astronomer, who came from Alexandria to correct the calendar, he adopted the mode of intercalation of one day in four years, which we still retain; and to amend the derangement which had been produced, he added ninety days to a year of the usual length, which consequently became what was called the year of confusion. The Julian calendar thus corrected came into use January 1, 45 B. C.

The circle of changes through which the moon passes in about thirty days, was marked in the earliest stages of languages by the word *month*, as the circle of changes of the seasons was designated by that of *year*. The lunar changes are much more obvious to the senses than the annual. When the sun has set, the moon is the great natural object which attracts our notice. Her changes of form and place are marked and definite to all; and the duration of her cycle is so short, as to require little effort of memory to embrace it. It was therefore more easy, and, in the earlier stages of civilisation, more common to reckon time by moons than by years. The month is not an exact number of days, being more than twenty-nine, and less than thirty; the latter was first tried as possessing the advantage of regularity; it existed for a long period in many countries. A few months of thirty days, however, would suffice to derange the agreement between the days of the month and the moon's appearance; but a further trial of twenty-nine and thirty days alternately, would preserve for a considerable period the agreement. The Greeks adopted this calendar, and considered the days of their month as representing the changes of the moon; the last day of the month was styled the old and new, as belonging to both the waning and the reappearing moon; and their festivals and sacrifices, as determined by this mode of reckoning, were considered to be connected with the same periods of the cycles of the sun and moon. According to Geminus, "Their laws and oracle directed that they should in sacrifices observe three things: and months, days, and years were so understood." With such a persuasion, a correct system became a religious duty. The rule of alternate months of twenty-nine and thirty days, supposes the length of the lunar month to be twenty-nine days and a half, which is not exact. Accordingly, the months and the moon became at variance;* the correction of this inac-

curacy, however, was not pursued singly; it was combined with another object, that of securing an exact correspondence between the lunar and solar years, the chief purpose of the early cycles.

According to the above rule, 12 lunations in a year would make 354 days, leaving about $11\frac{1}{2}$ days of difference between such a lunar and a solar year. The first cycle, which produced a near correspondence between the reckoning of the moon and the sun, was the Greek octaeteris, or period of 8 years; 8 years of 354 days, together with 3 months of 30 days each, made up 2922 days, which is the amount of 8 years of $365\frac{1}{4}$ days each. The usual method, it is said, was to add a month at the end of the third, fifth, and eighth year of the cycle. It is not known with certainty at what period, or by whom this method was introduced; probably about the sixth century before the Christian era. This cycle was imperfect, and was corrected by others of 16 and 160 years, which were suggested when the length of the solar and lunar periods became known with accuracy. At length a more exact cycle was introduced by Meton of Athens, 431 B. C. This cycle consisted of 19 years, and is so correct and convenient, that it continues in use among ourselves; the time occupied by 19 years, and by 235 lunations, is about the same; the former being less than 6940 days by $9\frac{1}{4}$ hours, the latter by $7\frac{1}{2}$; hence, if the 19 years be divided into 235 months, so as to agree with the changes of the moon at the end of that period, the same succession may begin again with much exactness. The coincidence of the solar and lunar period in this cycle was certainly an important discovery; indeed it is so exact, that it is still used in calculating the new moon for the time of Easter; and what is called the golden number by the moderns in stating such rules, is the number of this cycle corresponding to the current year.* Meton's cycle was made still more exact by Calippus 100 years later, 330 B. C.; he discovered the error of it by observing an eclipse of the moon six years before the death of Alexander the Great; he calculated a period of four cycles of 19 years, and left out a day at the end of 76 years, to make an allowance for the hours by which, as already mentioned, 6940 days are greater than 19 years, and 235 lunations.

The planets doubtless attracted the notice of men while they were becoming acquainted with the fixed stars. Venus, owing to her brightness, and her accompanying the sun at no great distance, and so appearing as the morning and evening star, was conspicuous; Pythagoras is said to have been the first who maintained that the evening and morning star are the same body. Jupiter and Mars, sometimes brighter than Venus, were also very observable; Saturn and Mercury, less so, would, in a clear climate, still be detected, with their motions, by persons who studied the aspect of the heavens. To reduce to rules the movements of these luminaries, must have taken time and thought; a remarkable evidence of their antiquity is to be found in the structure of one of our most familiar objects of time, the week, which comes down to us, according to the Jewish scriptures, from the commencement of the existence of mankind on earth. The same usage is found all over the East; it existed among the Assyrians, Egyptians, and Arabians. The week is found in India among the Brahmans; it has there also its day marked by those of the heavenly bodies. The idea which led to the usual designations of the days of the week is not easily discovered; the order in which the names are assigned, beginning with Saturday, is, Saturn, the Sun, the Moon, Mars, Mercury, Jupiter, and Venus. Various accounts are given of the manner in which the above order was derived from a previous one; all the methods proceeded on arithmetical processes connected with astrological views. Laplace considers the week as the most ancient

* Aristophanes, in 'The Clouds,' makes the moon complain of this disorder in the calendar—

'The moon by us to you her greeting sends,
But bids us say that she's an ill-used moon,
And takes it much amiss that you will still
Shuffle her days, and turn them topey-turvy:
So that when gods, who know their feast days well,
By your false count are sent home supperless,
They scold and storm at her for your neglect.'

* The same cycle of nineteen years has been used by the Chinese for a vast length of time; their civil year consisting, like that of the Greeks, of months of twenty-nine and thirty days. The Siamese also use the same period.

monument of astronomical knowledge. This period has gone on without interruption from the earliest recorded times to our own days, surviving the extent of ages and the revolutions of empires.'

BENEFICIAL CO-OPERATION OF THE WORKING-CLASSES.

AMONG the various schemes which have been tried of late years for the improvement of the labouring classes, we know none more efficient than those that induce and enable them to assist themselves. In the hope of stimulating others to follow in this track, we give the case of a benefit scheme which has been in operation for the last nine months among the workmen of the lighting and cleaning departments of the police of Edinburgh, and which may, we believe, be taken as a specimen of what can be done among a class of men employed at a low rate of wages, and without any advantages or facilities beyond what are common to the whole labouring population.

The scheme, we understand, originated in the benevolent exertions of Mr Ramsay, the superintendent of these departments, to alleviate the distress which befell the workmen under his care when death occurred in their families, being stimulated thereto by witnessing the privations which were submitted to by the men in the establishment when a wife or child died. It frequently happened that the parties were altogether destitute of the means to bury their dead; and hence, as a matter of necessity, that duty was devolved upon the parish. In other cases, the expenses of the funeral hung like a millstone about the neck of many an honest and industrious man, and the debts then incurred were sometimes the commencement of the ruin of a whole family. From the want of ready money, the most indispensable articles were procured at a cost sometimes amounting to double or even triple their value; the only choice left to the poor man being, not where he was to buy cheapest, but where he could obtain credit. Then followed the usual train of evils which break the heart or ruin the health—children in rage, clamorous for food—the father insufficiently clad to resist the cold and rain to which his avocations constantly expose him—with bad shoes on his feet, he is laid up by a cold, which terminates in rapid consumption. His children are then beggars; and a blessed deathbed is his if they become nothing worse.

To obviate or lighten some of these evils, a scheme was organised, under which each person in these departments was taxed to the extent of 6d. on the death of a husband or wife, and 3d. for that of a child, to defray the cost of the funeral; the sums realised varying, in the former case, from L3 to L4 and upwards, and, in the latter, to the half of these sums. This scheme existed for thirteen years, in the course of which time nearly L800 of funeral money was collected and expended. The mere extent of relief afforded was no doubt great; but it was held of far more importance to form habits of self-reliance, and altogether to repudiate even the idea of assistance from public charity. One condition, therefore, was, that no part of the funeral expenses was to be defrayed by the parish. The practical working of this scheme, though on the whole beneficial, was found to be imperfect, inasmuch as it afforded relief from one source only of the casualties to which the men were exposed; and its success suggested the idea of extending the system of self-reliance and mutual assistance, so as to preclude the necessity of pecuniary relief from public charity, or of any dependence upon gratuitous medical aid.

For this purpose Mr Ramsay devised a plan, by means of which all persons employed under him were bound to contribute from their pay 6d. a week, in return for which the following benefits were secured to them:—*First*, Alimony, during sickness, at the rate of 9d. per day, or 5s. 3d. per week, for the first thirteen weeks; 3s. 6d. per week for the next thirteen weeks; and 2s. 6d. per week for the next twenty-six weeks. *Second*, Funeral money at the rate of L4 for a man, L3 for a wife, and 15s. for a child. *Third*, Medicine and medical attendance for the men and their whole families, however numerous, or whatever the nature of the illness under which they might labour. The balance remaining, after defraying these sources of expense, to be divided twice in the year, in the rates of their respective contributions.

The scheme, and the data on which it was founded, were submitted at the outset to the board of police, who after

mature consideration, gave it their sanction. It has now been in operation for nine months; and we have just received the state of the accounts for the six months ending the 15th November, which was submitted to the police board at one of their late meetings. From this statement it appears that the working of the scheme has been most successful, and is full of instruction as to one important means of improving the condition of the class for whose benefit it was intended. It appears that the subscriptions received from 152 men, during the six months, amounted to L99, 14s. 6d.; out of which there has been paid for alimony to thirteen men, whose united periods of sickness amounted to ninety-one days, the sum of L3, 8s. 9½d.; for the funeral money of one man, one wife, and seven children, L12, 5s.; while the salary paid to the surgeon, which we may mention is fixed at the rate of 2d. per man per week, amounted to L33, 2s., and the allowance to a clerk of L2, 12s. The whole expenditure, therefore, amounted to L51, 7s. 7½d., being about the rate of 1d. per week for alimony and funeral money, or 3d. per week, including the allowance to the medical officer. The surplus, therefore, which amounted to about half the sum contributed, has been returned to the men, and has afforded a dividend of 6s. 6d. to each man employed in these departments. No doubt the amount of sickness has been, during the last half year, smaller than can be calculated upon at an average; but even in the most unhealthy seasons, the sum required from such a large body of workmen to insure the same amount of benefits as is allowed on this scheme is so small, in comparison with the advantages to be derived, as to form no burden even upon the lowest rate of wages: while the conscious feeling of independence enjoyed by the men, from their having secured to them, at so trifling an amount of expense, a provision in the event of sickness, and a small fund in the case of death, together with medicine and medical attendance for themselves and their families, are of the utmost value in elevating them in their own estimation, and relieving them from the degrading necessity of application to the ordinary sources of charity.

In connexion with this scheme, a contract was entered into with a respectable undertaker for the supply of coffins at fixed prices, varying according to size, from the smallest, 18 inches long, which costs 2s. 9d., to that of 6 feet 6 inches, at a cost of 16s. 11½d. The coffins are covered with cloth, and mounted with lace, and delivered in a decent and proper manner at the houses of any of the men who may require them.

Still farther to improve the condition of the men under his care, Mr Ramsay has added to the benefit scheme a plan partaking of the benefits of a co-operative society, under which such of the workmen as choose to join in it are supplied with bread, oatmeal, potatoes, and coal, at an expense considerably below the ordinary retail prices. This is done by entering into a contract for the supply of the articles required, which, from the number of the men, is necessarily on a large scale; and, consequently, the articles are furnished at the lowest wholesale prices, and dealt out to the men in such quantities as suits their convenience.

To show the working of this part of the scheme, we may state what is brought out in the abstract before us, that there have been supplied within the last six months 5981 loaves, 2250 pecks of oatmeal, 158 bolls of potatoes, and 180 tons of coal; the aggregate cost of which is L376, 6s. 8d. This of course is an expenditure altogether separate from the benefit scheme, and, unlike which, it is entirely optional for the men to enter into it or not, though the money saved by this mode of purchasing provisions and other necessary articles greatly more than repays the cost of the benefit scheme, to say nothing of the additional comfort and thrift of obtaining coal in tons, and potatoes in bushels, and other articles in proportional quantities, compared with the wretched system, so common among the poor, of purchasing their necessaries in the smallest quantities, and, as a consequence, at the highest price, though of inferior quality. It is probable that much of the success of this scheme may arise from the unintermitting watchfulness of Mr Ramsay, under whose superintendence it has been got up, and who has always taken a deep interest in its management. There is, however, a committee appointed by the men themselves, under whose inspection the contracts are made, who take charge of the collection and disbursements of the money, and whose duty it is to see that the contracts are properly fulfilled. This is an important feature in the scheme, identifying the men with the management.

ing, and interesting them in its success. A scheme of this kind can be carried out to its full measure of success only where there is a considerable body of workmen; but wherever men are permanently employed, even a small number may, with great advantage, make arrangements to secure a part, if not the whole of the benefits enjoyed by the plan of co-operation we have described, and for the maturing of which Mr Ramsay deserves the thanks of the community.

REMARKABLE BOOKS.

THERE are few subjects so barren as not to afford matter of delight, and even of instruction, if ingeniously treated. Montaigne has written an essay on *Coaches*, and another on *Thimble*. Lyonnnet has written a large work on the goat-moth caterpillar; and Straus-Durckheim another big volume on the cockchafer. Evelyn wrote a discourse on salads, entitled *Acetaria*, which has been admired and commended by the best judges of literature. In 1669 Mr Steadman published a book called *Campanologia, or the Art of Ringing*, which reached three editions in the course of a few years. Another work on the same subject was published by Mr Shipway, in three parts, in 1816. A curious little treatise on sneezing, entitled *Mart: Schoollii de Strumatibus tractatus copiosus, omnia ad illam pertinentia, &c.* was published at Amsterdam in 1664. Tobias Swinden, an English clergyman, wrote an *Inquiry into the Nature and Place of Hell*, and a second edition of his work appeared in 1727, with an illustrative plate. In this singular work the reverend gentleman endeavours to prove that the sun is Tartarus! Chevreau has written *A History of the World*, in which he tells us that it was created a little after four o'clock in the afternoon of Friday, September 6!—a very precise bit of information. The rare edition of the *Biblia Germanica*, in two folio volumes, published in 1487, contains many coloured woodcuts, remarkable for the singularity of their designs; for instance, Bathsheba is represented washing her feet in a small tub of water, and Elias ascending to heaven in a four-wheeled wagon. H. Maurice's *Impartial Account of Mr John Mason of Water Stratford*, 1635, informs us that Mr Mason, who is supposed to have been the founder of the gymnastic sect of Jumpers, preached a sermon announcing that our Saviour's reign of a thousand years upon earth was about to commence on the very spot where he was standing, which was received with so much favour, that a great concourse of people, for many miles round, took up their habitations there in expectation of the event—truly an excellent stratagem for increasing a congregation.

An edition of the *Classics*, published on the Continent, has a curious frontispiece representing on one side a divine personage, and on the other a figure of the author, from whose mouth issues a label with these words:—'Lord, lovest thou me?' which question is answered by another label affixed to the mouth of the sacred figure, with these words:—'Highly-famed, excellent, and most learned rector of Seger, imperial poet, and well-deserving master of the school at Wirtemberg, yes, thou knowest I love thee!' The interesting and enthusiastic letters of the Prince of Mirandola were so highly admired and prized by his contemporaries, that some of the earlier editions are entitled *The Golden Epistles of the most learned, most noble, and most elegant of Mortals*. One of the rarest of privately-printed works is a curious folio volume entitled *Pauli Cortesii Protocollarii Apostolici, de Cardinalatu, libri iii.*, 1510. The author of this book, tired of the vicissitudes and troubles of public life, retired to the town of Montana Villa, two miles from St Germain, in France, and determined to devote the remainder of his life to literary pursuits. In this seclusion, a short time before his decease, he established a printing-press, whence issued only the above work. Clavell's *Recreation of an Ill-led Life, or a Discoverie of the Highway Laze, with vehement Disquisitions to all in that kind Offenders, with Instructions how to know, shun, and apprehend a Thief, most necessary for all Travellers*, 1634, is a scarce book in verse by a celebrated highwayman, and contains also a poetical address to the author's uncle, Sir W. Clavell, and others to the Lord Chief Justice, &c. A rare little book, *The Academy of Pleasure*, 1656, contains a portrait, supposed to represent its author, in the dress of a book-chapman.

Some books are remarkable on account of certain events and anecdotes which they have given rise to. Thus, the Marchioness of Lambert's excellent works (Paris, 1761)

are additionally interesting, from the circumstance that it was upon seeing the Empress Elizabeth reading them that Peter the Great lamented his want of education. Brewer's play of *Lingua, or the Combat of the Tongue and the Five Senses for Superioritie*, 1632, is more esteemed, owing to Winstanley's statement, that when it was performed at Cambridge, Oliver Cromwell acted the part of Tactus in it, from which he imbibed his sentiments of ambition. The second edition of Woolaston's *Religion of Nature*, is valued from the fact of Benjamin Franklin having assisted in the printing of it. 'I was employed,' he says, 'at Palmer's on the second edition of that work. Some of Woolaston's arguments appearing to me not to be well-founded, I wrote a small metaphysical treatise, animadverting on those passages. It was called *A Dissertation on Liberty and Necessity, Pleasure and Pain*, of which I printed only a few copies.' A little book, entitled *Epistola Obscurorum Virorum ad Du M. Orisium Gratiam*, 1643, is interesting, at first sight, from the story of Erasmus having laughed so heartily on reading it, that he broke an imposthume of which he lay dangerously ill, and in consequence recovered without undergoing any operation. The rare Latin commentary on the Marquis of Montrose's military exploits, written under the signature of T. G. by the Rev. George Wishart, a Scotch prelate, and published at Paris in 1648, is remarkable from a historical anecdote thus related by Hume:—'As the Marquis of Montrose was led forth to his execution, they made yet one effort more to insult him in this last and melancholy scene: the executioner brought that book which had been published in elegant Latin concerning his great military actions, and tied it by a cord about his neck.' Father Aucher's *Armenian and English Grammar* (Venice, 1819) is prized from the statement that Lord Byron contributed the English portion. William Fowler's *Engravings of Mosiac Pavements, Stained Glass, &c.* in two large folio volumes, are highly interesting from the fact of their author having been originally a journeyman carpenter, of patient and persevering habits, and who had to encounter almost insurmountable difficulties in executing this work, which is scrupulously correct in all its details, and is entirely his own: the drawing, the engraving, the preparation of the colours, and even the making of the paper (for he could get no paper-maker to undertake it), and the binding, are all the work of his own hands. As not more than forty copies were ever completed, it is now an extremely rare and valuable work.

Certain books are rendered precious by their containing personal sketches and notices nowhere else recorded. This is the case with Robert Armin's *Nest of Ninnies*, 1608, which contains anecdotes, in verse and prose, of various celebrated fools and jesters. In Casio's *Libro Intitolato Belona*, 1525, an extremely rare book, are numerous notices of Ariosto and the contemporary poets. A rare and neglected work, entitled *Horanyi Memoria Hungarorum et Provinciarum Scriptis editis Notorum*, in three volumes, published at Vienna in 1777, contains the lives of several authors, and bibliographical information not to be found elsewhere. A little book, entitled *Th: Spizalii Infelix Litratus, Labyrinthis et Mieris suis cura posteriori creptus, et ad Supremam Salutis Domicilium deductus, sive de Vita et Moribus Litratorum*, 1680, contains an abundance of 'Calamities of Authors,' unnoticed by D'Israeli and all others who have written on that very encouraging subject.

A MODEL FRENCH FARM KITCHEN.

Perhaps a more gratifying sight does not exist than the interior of a large farm kitchen prepared for the evening meal, especially during the winter season. Its bright wood fire, the long table covered with the savoury, smoking dishes, the huge tankards of foaming beer or cider, with the happy countenances scattered round, speak of peaceful labour and healthful industry. The farm kitchen of Bouqueval was a fine exemplification of this remark. Its immense open chimney, about six feet high and eight feet wide, resembled the yawning mouth of some huge oven. On the hearth blazed and sparkled enormous logs of beech or oak; and from this prodigious brazier there issued forth such a body of light, as well as heat, that the large lamp suspended from the centre beam sunk into insignificance, and was rendered nearly useless. Every variety of culinary utensils, sparkling in all the brightness of the most elaborate cleanliness, and composed invariably of copper, brass, and tin, glowed in the bright radiance of the winter fire,

as they stood ranged with the utmost nicety and effect on their appropriate shelves. An old-fashioned cistern of elaborately-polished copper showed its bright face, polished as a mirror; and close beside stood a highly-polished bread-trough and cover, composed of walnut-tree wood, rubbed by the hand of housewifery till you could see your face in it, and from which issued a most tempting smell of hot bread. A long and substantial table occupied the centre of the kitchen; a table-cloth, which, though coarse in texture, vied with the falling snow for whiteness, covered its entire length; while for each expected guest was placed an earthenware plate, brown without, but white within, and by its side a knife, fork, and spoon, lustrous as silver itself. In the midst of the table, an immense tureen of vegetable soup smoked like the crater of a volcano, and diffused its savoury vapours over a dish of ham and greens, flanked by a most formidable array of mutton, most relishly stewed with onions and potatoes. Below was placed a large joint of roast veal, followed by two great plates of winter salad, supported by a couple of baskets of apples; and a similar number of cheeses completed the arrangements of the table. Three or four stone pitchers, filled with sparkling cider, and a like quantity of loaves of brown bread, equal in size to the stones of a windmill, were placed at the discretionary use of the supping party.—*Eugene Sue.*

LAWS OF NATURE.

If the laws of nature, on the one hand, are invincible opponents, on the other they are irresistible auxiliaries; and it will not be amiss if we regard them in each of these characters, and consider the great importance of them to mankind. 1. In showing us how to avoid attempting impossibilities. 2. In securing us from important mistakes in attempting what is in itself possible, by means either inadequate, or actually opposed to the ends in view. 3. In enabling us to accomplish our ends in the easiest, shortest, most economical, and most effectual manner. 4. In inducing us to attempt, and enabling us to accomplish objects, which, but for such knowledge, we should never have thought of undertaking.—*Herschel.*

DOGS' SCENT FOR GAME.

There is a notion that dogs lose their scent or smell for game-birds during the season of incubation. That, however, says a correspondent of the *Gardeners' Chronicle*, I consider to be wrong. I think it is more likely that the birds lose, or rather do not emit, scent or smell during the time in question; hence the notion. I mentioned this to a gentleman well acquainted with dogs and game, and he told me the following in favour of what I have advanced. He was once aware of a partridge's nest that was 'hard set upon' near where a party of gipsies had fixed their abode, and although they had three dogs with them, yet the wary bird led off her brood three days afterwards. There must be some truth in what I have stated, otherwise the smell from the bird on the nest would have led the prowling dogs upon her. If my views on this subject are correct, it shows a wise provision of Nature to protect birds from harm during incubation; for if it were not so, they must often fall a prey to canine enemies. It may be asked, how does it happen that birds do not emit smell while sitting on eggs? That may be owing to the habits or conditions of birds being changed; for during the time of incubation, they lose in a great measure all thought of self-preservation.

FORCE OF PERIODIC VIBRATIONS.

Many curious instances might be mentioned of the great effects produced by periodic vibrations: one of the most familiar, perhaps, is the well-known result of marching a company of soldiers over a suspension-bridge, when the latter, responsive to the measured step, begins to rise and fall with excessive violence, and, if the marching be still continued, most probably separate in two parts. More than one accident has occurred in this way, and has led to the order (we believe) that soldiers, in passing these bridges, must not march, but simply walk out of time. Another curious effect of vibration in destroying the cohesion of bodies, is the rupture of drinking-glasses by certain musical sounds. It is well known that most glass vessels of capacity, when struck, resound with a beautifully clear musical note of invariable and definite pitch, which may be called the peculiar note of the vessel. Now, if a violin or other musical instrument be made to sound in the same

vibrations, the note grows louder and louder, and eventually may break. In order to insure the success of this experiment, the glass should not be perfectly annealed; however, the tendency to break is invariably the same.—*Polytechnic Magazine.*

WHERE ARE THEY?

BY S. W. PARTRIDGE.

WHERE are they—the companions of our games,
With whom in youth we gambolled on the sod;
The gray-haired fathers and the gentle dames,
Whose hospitable thresholds erst we trod;
The beauteous forms that taught our hearts to love,
And woke our hopes and fears with magic spell;
The cheerful friends with whom we went to rove,
Whose tales around the hearth we loved so well—
Where are they?

Where are they—the gay train of laughing hours,
Youth's longed-for morrows and glad yesterdays,
That joyous season of hope's budding flowers,
That fairy portal to life's thorny maze;
The pregnant sunny seed-months of life's year,
The calm bright moments of its April sky,
Ere stormy passion and beclouding care
Had vexed and marred its blue serenity—
Where are they?

Where are they—the fond dreams of buoyant youth,
Trusting to-morrow, scornful of to-day,
As, yet undoubting the fair syren's truth,
Slumbering in hope's soft lap entranced we lay?
Where are the glowing visions that arose
Before our eyes like purpling clouds of eve,
Of beauty, fortune, honour, and repose,
And all the witcheries hope alone can weave—
Where are they?

Where are they—the resolves of life's young morn,
The resolutions firm to be and do,
When, weakness, difficulty laughed to scorn,
Sage plans for future years we fondly drew;
The deep devotedness to love and truth,
The manly purpose and the sacred vow,
That clustered, big with promise, in our youth,
Like opening spring-buds, blushing on the bough—
Where are they?

MISS MARTINEAU'S CASE.

'Few medical men of any experience will have the slightest difficulty in perfectly comprehending the state so graphically described by the sufferer. It is seen every day in women at the turn of life; and the grand mistake that is ever committed in regard to it, is to look on mere functional derangement, accompanied by pain and excessive discharge, as organic disease.'—*Medical Gazette.* There is no theorist like your opposer of theories. In these and a few more like sentences the *Medical Gazette* disposes of Miss Martineau's illness and her so-called cure by mesmerism, the mere supposition of a person unconnected with the case being presented as sufficient to overpower all that was patiently observed and cautiously said by others on the spot, including the patient herself. Whatever be the real character of Miss Martineau's case, one cannot but be amused to see extremes thus return upon themselves, and scepticism pretend to an oracular power far beyond the ordinary stretch of the grossest superstition.

BELIEF.

Were we to believe nothing but what we could perfectly comprehend, not only our stock of knowledge in all the branches of learning would be shrunk up to nothing, but even the affairs of common life could not be carried on.—*Tucker.*

* Complete sets of the *Journal*, First Series, in twelve volumes, and also odd numbers to complete sets, may be had from the publishers or their agents. A Stamped Edition issued for transmission, post free, price Two-pence halfpenny.

Printed by William Brodhead, of No. 6, York Place, and Frederick Mullist Evans, of No. 7, Church Row, both of St. John's Newington, in the county of Middlesex, printers, at their office, Lombard Street, in the precinct of Whitefriars, and City of London: and Published by WILLIAM SOMERVILLE ORR, of 8, Abney Church, at No. 8, ABNEY CORNER, both in the parish of Chesham, and in the city of London.—Saturday, January 6 1845.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 54. NEW SERIES.

SATURDAY, JANUARY 11, 1845.

PRICE 1½d.

'AN APOLOGY

THE appearance of sincere penitence is perhaps the most touching of all things. Anger at the offence vanishes; the error is forgiven; and the offender, so far from being degraded by his confession, runs a good chance of being exalted. There is something which makes these results among the most certain of all mental phenomena. We all feel the weakness of our nature, and, like an Irish cottier helping a beggar, because he does not know but he may be a beggar next year himself, we sympathise with acknowledged transgression, because we never can be sure that we are not to be very speedily in the confessional too. Therefore it is that men in general melt at the sight of penitence, even in those who may have been aiming at their own hurt, or wounding their own self-esteem. They might be full of the bitterest indignation while the offence was still in the course of being given, or while the offender remained incontinent; but the moment that error or obduracy was exchanged for a humble sense of the wrong done, however faintly that might be expressed, all anger must vanish; and it is the direct and simple tendency of man's nature, when unprevented by other feelings, to receive his errant brother back again to his heart, and be the same to him as ever.

It is, however, very unlucky that some persons either never can see that they do wrong, or will not, on any compulsion, acknowledge it. To impute to them an error of any kind, to complain of an injury or insult having been offered by them, only rouses their self-love, and throws them into a paroxysm of obstinacy, during which they will dispute the clearest reasoning that may be brought against them, and even deny their own acts, if these tend to their condemnation. The no-wrong-doers and always-in-the-right-men are a very considerable class in point of numbers, and it is sometimes not a little amusing to observe that thorough conviction of their own entire innocence which bears them up against charge and challenge of every kind. Some take an imputation very tartly, however justly made. Some fall sulkily upon their self-esteem, and simply refuse to admit anything so derogatory. Others coolly pity the absurd people who think they have been mistreated, and wonder that any one could be so foolish as to imagine that *they* COULD BE in the wrong. Perhaps there is still another sub-class who merely act from false system or bad habit, and only refuse to own their error because they never have been taught to see that to do so handsomely and readily is, and can be, no disgrace to a human being, but, on the contrary, is a virtue. Much harm of course follows from this indisposition to own error; for if the guilty will not make concession, much less is it to be expected that the innocent and injured parties are to do so; and therefore

alienation, and all its train of evils—if not positive and active hostility—are sure to take place. Many a time must the doggedness of a moment have made those enemies who, otherwise, would have continued friends, and embittered whole lives which otherwise might have been happy. One moment will suffice for such an effect; for this little space of time is often the determining point of all future conduct. Had *that moment* been graced by the beauty and holiness of repentance, instead of being signalised by a spasm of wicked and selfish obstinacy, all might have been well. But it was not so, and misery came of course. The no-wrong-doers maintain their self-esteem in high mettle no doubt; they may cherish a pride somewhat like that of a fortress which never surrendered or was taken; but they have a small chance of being happy. They will necessarily be on bad terms with many persons, which is always a great inconvenience. They will, in a vast number of cases, only be tolerated, instead of being liked, and thus lose all the benefit of that general goodwill which often acts like a favouring gale to blow the vessel of a man's fortunes into port. In short, the injury they do to society by their shortsighted and selfish policy will powerfully react against them, and that which is only a temporary cause of irritation to those whom they aggrieve or injure, may prove something little, if at all short, of their own permanent ruin.

To be ready, on the other hand, to acknowledge and ask forgiveness of an error or offence, tending as it does to the general comfort, by preserving the sweetness of mutual relations in society, ought to, and ever does, favour the happiness of the individual. We must, from the constitution of our nature, occasionally speak or act amiss: this must be submitted to as unavoidable. There is but one remedy for it—that he who does either the one or the other, should take the earliest opportunity of manifesting regret for the error. To be thus penitent—thus to give obedience to what appears as a great law in our being—entitles us to forgiveness; for it is all that the providential arrangements of our nature admit of being done to repair the wrong we have committed. We have a right thereafter to be made the same as if we had never done wrong, for we have fulfilled the great law upon the subject. Political institutions, for reasons of their own, do not act upon this maxim with their offenders; but the greatest criminal will, upon a perfect repentance, obtain forgiveness from men as individuals. And those refusing to forgive a minor offence against themselves, when it has been thoroughly repented of, are sure to be condemned by public opinion. When any one, then, has done wrong, and expresses penitence, he is not to be considered as humiliating himself to a poor fellow-creature no better than himself. He is obeying a great natural institution, and thereby yielding obedience to a power far above that of mortals. All men do not

see the matter in this its true light—they do not know the fact philosophically; but they *feel* that it is so, and act accordingly. We instinctively recognise the beauty and virtue of a handsome apology.

Apologies, expressions of regret for light offences given, intreaties for forgiveness of those of graver moment, thus take a place among high things, however familiarly we may from habit regard them. Heaven's face shines on every word of this kind spoken in sincerity and for peace-sake. Error may be great—alas! how great may our errors be!—but no error can be so great but penitence may be greater, and absolution must then be granted by the wronged party, or to him that moment is the whole guilt transferred. Let no one, then, ever grudge to confess himself in the wrong, or pridefully refuse to ask remission of his offence. He can never suffer for taking this course in any eyes but his own, and that will never be but at the moment. The next instant, if his repentance has been sincere and unreserved, he must experience the comfort of that peace which attends every truly good action.

There is but one danger on the other side. It is necessary to guard against being lulled into a too great dependence upon the apologetic principle. Error, when it becomes habitual, and frequent of occurrence, ceases to have any rightful claim to forgiveness upon the mere expression of regret, because, if that regret were true, it might be presumed to have the effect of forbidding such a recurrence of error. Hence we all feel, when a transgression is repeated for the fiftieth time, and is instantly followed by the customary expression of penitence, that the latter is a mockery, adding to, rather than extenuating the evil, seeing that, besides the original offence, a thing in its proper character sacred has been perverted to a wrong purpose. The young, after their first experiences of the benefit of an apology, are particularly apt to rely overmuch upon it. This, however, is an error calling for its own check, and that check, we should think, it can never be difficult to impose. And it is hardly necessary to remark, that no abuse to which penitence is liable can ever take from the absolute value of penitence itself—the blessed medicating principle in our nature, the preserver of peace among men, the talisman that promises us more than aught that earth has ever given, or ever can give.

THE ROYAL OBSERVATORY AT GREENWICH.

It is fair to suppose that but few persons in this country are ignorant of the existence of the institution whose name stands at the head of these columns. Some, during a visit to London, and while sauntering in Greenwich Park, may have seen its exterior. Others, again, have read of it in books of voyages, or seen the words printed in the margin of maps, as the point from which longitude is reckoned. But very few possess any definite idea as to the nature of the operations carried on within it; of the patient watching, amounting to severe labour, in conducting the extensive, various, and delicate observations for which it has long been celebrated; or of their high importance in a scientific and commercial point of view.

These points are, however, ably elucidated in the annual report for the present year of G. B. Airy, Esq. the astronomer royal, which, while it explains the satisfactory state of the scientific proceedings, contains also some general notices that may enable the great body of readers to comprehend the more than national value of such an establishment.

It would not be out of place to give, before proceeding farther, a brief history of the building, which is erected on the top of a gravelly hill in Greenwich Park, on the site of the ancient tower built by Duke Humphrey in the reign of Henry VI., commanding a fine and impressive view over the smoke-shrouded city, the flowing river alive with vessels, and the fertile plains of Essex. It was built by order of Charles II., who, with all his levity, seems to have been aware of the importance of

science: the first stone was laid by Flamsteed, who had been appointed astronomer royal in August 1675, and no delay took place in its completion and furnishing it with accurate instruments. By the words of Flamsteed's commission, he was directed 'to apply himself with the utmost care and diligence to the rectifying the tables of the motions of the heavens, and the places of the fixed stars, in order to find the so-much desired longitude at sea, for perfecting the art of navigation.' With what success this has been done, may be inferred from the remarkable words of Delambre, who, writing on the four volumes of observations by Maskelyne, astronomer royal at the commencement of the present century, observes, 'that if, by a great revolution, the sciences should be lost, and that this collection only were saved, there would be found in it materials sufficient to rear almost an entire new edifice of modern astronomy.'

The whole establishment comprehends two principal buildings, one the observatory, the other the dwelling-house; the former is a low oblong erection, placed east and west, with four principal apartments on the ground-floor, in which the most important observations are carried on; in one of these, which has a double sloping roof fitted with sliding shutters, for convenience in observing transits, is the transit instrument, eight feet in length, resting on two stone pillars, and interesting from having been used by the astronomers royal from the days of Halley. In an adjacent apartment is the magnificent mural circle by Troughton, which was placed on its stone pier in 1812, and although it has a diameter of nearly eight feet, such is the accuracy with which it has been constructed, that its position may be ascertained to the tenth of a second. In the other rooms are other circles, and a variety of astronomical instruments, as well as a library containing many scarce scientific books.

It is, however, beyond our province to attempt a description of the splendid and complicated instruments contained within the observatory, which we should scarcely succeed in making intelligible to the general reader; suffice it to say, that the establishment is supported at the expense of government, and is under the direction of the lords of the admiralty.

Astronomical time is not divided, like civil time, into two periods of twelve hours, but is counted regularly from one to twenty-four. Now, it is one of the most important objects in the duties of the observatory to find the *true time*; this is ascertained at Greenwich by accurate determination of the places of various stars, and their transit over the meridian. From these observations the mean solar time is computed; and this once known, the finding of the longitude of any place is comparatively easy. A knowledge of the true time being of the highest importance in keeping the reckoning of a ship on a voyage, the lords of the admiralty determined, about ten years since, on a means for making known daily the hour of one o'clock. Such is the skill displayed in the observations, that this hour is now ascertained with the utmost nicety, and from the summit of the building has been made known with the greatest regularity from the time the plan was first adopted.

Every day, at five minutes to one, the captains of vessels in the river, within sight of the observatory, may be seen directing their telescopes towards a black ball slowly rising on a pole fixed on the roof of its north-western angle; they then prepare their chronometers, and keeping their attention fixed on the ball, which has become stationary at the top of the pole, they note the instant when it begins to descend; at that instant it is one o'clock; and it will be obvious that the mariner has then the opportunity of knowing whether his chronometer is fast or slow; he may set it to the true time, and, by daily observation of the descent of the ball, ascertain its rate of going.

There is an apartment in the building appropriated to chronometers. It is the custom with makers of those instruments to send them to the observatory for correc-

tion and trial. Their daily rate is then observed, and noted down for the use of the owners; the same course is followed with the chronometers of ships lying in port. Visitors to Greenwich Park may frequently see a captain descending the hill with his time-keeper in a handkerchief under his arm. The present number of chronometers on trial exceeds one hundred, many of them being from government ships paid off, and thirty in preparation for the determination of the longitude of Valletia in Ireland.

Another very important object in the institution and maintenance of the observatory, is the observations of the moon, and the determination of the places of fixed stars necessary for ascertaining instrumental errors arising in those observations. In the early history of the building, these were regarded merely as secondary, but they appear to have been followed up with the greatest regularity, even when all others were neglected. The effect of this regularity is most honourable to the institution; for the existing theories and tables of the moon are everywhere founded on the observations at Greenwich, which is looked to as that from which alone adequate observations can be expected; and it is fair to predict that, while the duties are as efficiently performed as at present, lunar tables will always be founded on the same authority. To seafaring men lunar tables are of little less importance than true time; relying on their correctness, they sail away into the broad ocean, over which the calculations made thousands of miles distant serve as finger-posts. In order to render this branch of the observations still more efficient, an additional building is being erected, in which the moon may be observed through her entire passage. Owing to the construction of the portion of the building at present devoted to this purpose, one half of her course is very imperfectly observed, and one fourth is quite lost. When the new part is completed, it is anticipated that the observations on our satellite may be made almost every night; at present, from the cause above alluded to, they do not exceed one hundred in the year. Some idea of the patience necessary on the part of the observer, may be inferred from the fact of his being required to watch from moonrise to an hour or more after sunrise, or from an hour before sunset to moonsetting.

Of late years, in addition to the astronomical, a series of magnetic and meteorological observations have been conducted at the observatory. For the observation of the magnetic dip, and some other points which could not be carried on near the great magnets, or other disturbing influences, a small outbuilding has been raised of wood, the greatest care being taken that no particle of iron should be used in the construction. Such is the extreme delicacy and susceptibility of some of the instruments in this apartment, that they are suspended by skeins of fibrous silk, enclosed, in some instances, within tubes of glass. These skeins are prepared at Manchester expressly for the purpose; the fibres consist of seven or eight threads, as when reeled off in readiness for spinning: the slightest twist would render them unfit for use; and it is essential that they should be of uniform thickness.

There are three magnetometers, the magnets for which were made at Göttingen; they are of polished steel, each two feet in length, one inch and a half in width, and one quarter of an inch in thickness. In reading off the results, allowance is made for the presence of iron in the apparatus which supports them, or in other parts of the room. These instruments, with the barometer, and the wet and dry thermometers, are observed every two hours, day and night (except on Sundays); the dew point four times every day; the magnetic dip is observed on the forenoon and afternoon of each of two days in every week; on one particular day in every month, previously determined for the observatories in various parts of the world, and known as a term day, magnetic observations are made at every five minutes; on one day in each month, hourly observations of the barometer are made; observations with

the actinometer, an instrument for ascertaining the radiation of solar rays, are made when circumstances are favourable; electrical and extraordinary observations of any kind, when circumstances require them. The indications of the self-registering instruments are regularly preserved or read off; the rain gauges, &c. which are cumulative, but not self-registering, are read, some once in a day, some once in a week.

In addition to these instruments, there are an atmospheric electrometer, a galvanometer, and an anemometer. The last registers of itself the force, direction, and duration of winds. There are also self-registering thermometers, which are suspended from the side of the Dreadnought hospital ship, for ascertaining the temperature of the water of the Thames, with the object of assisting the registrar-general in the meteorological report affixed to his weekly sanitary report.

In astronomical science, everything depends on the precision with which the longitude of a place is determined as regards any other fixed place: by the transmission of chronometers from one point to the other, this may be ascertained. An operation of this nature is now in progress to determine the difference of longitude between Greenwich and Pulkowa, in Russia. As it is necessary that the observers as well as the instruments should be interchanged, M. Struve, astronomer at the latter place, has come over to make his observations from this point, for which purpose a transit instrument has been placed at his disposal.

The Nautical Almanac is generally printed three years in advance, for the benefit of those who go long voyages: the volume for the year 1847 is now published. The list of stars for this work has a first claim in the astronomical observations; and it is a rule that each star shall be observed at least twenty times in every three years. Besides these, there are observations of stars for refraction; of those selected for the moon-culminating list of the almanac; of those compared with comets, and others observed in trigonometrical survey. The sun, moon, and planets are observed at every practicable opportunity, the latter through all hours of the night (except on Sundays), when the moon only, with accompanying stars, is observed. Occultations, diameters, and the eclipses and movements of Jupiter's satellites, complete a catalogue which, for scope and detail, reflects the highest credit on those concerned in its execution.

The electrical apparatus is attached to a pole 80 feet high, fixed in the garden; a wire connected with this is led into one of the rooms of the building, where pith balls, suspended near a bell, are attached to it. When the apparatus is excited by the electric state of the atmosphere, the balls become violently agitated, and, striking against the bell, cause a ringing, which immediately attracts the attention of the attendant.

In Flamsteed's time, a well was sunk in this garden 100 feet in depth, with steps leading to the bottom, for the purpose of observing the stars in the daytime; but this has long since been arched over, as the improvements in the construction of telescopes render it unnecessary.

The whole mass of observations, both meteorological and astronomical, is regularly printed, a quarto volume of some thousand pages appearing once in the year. Most of these are distributed amongst the observatories all over the world, with a view to assist the cause of science, and to facilitate the great series of observations, undertaken at the expense of government, which have now been carried on for four or five years, and are expected to be brought to a conclusion in the present year. In order to have some security that the assistants, of whom there are nine regularly on the establishment, are in attendance to take their observations at the time appointed, a clock, commonly termed 'the watchman's clock,' is fixed in the ante-room; it has no hands, but a series of knobs, to which cords are attached on the dial-plate, which turns round; this is secured by a door with a lock and key, so that

the only external communication is by the cords, one of which being pulled by the assistant when he leaves, a knob is displaced, the dial-plate turns round, and thus a complete check is kept upon the attendance of the subordinate officers.

Among the extraordinary scientific operations to which the observatory has contributed its aid, was that of instructing the officers of the corps of Royal Engineers, who were appointed to trace the Canadian boundary; one portion of which, a straight line of a distance of 70 miles, was to connect two defined points. The country through which this line was to pass is described as surpassing in its difficulties the conception of any European. It consists of impervious forests, steep ravines, and dismal swamps. A survey of the line was impossible; a plan was therefore arranged by the astronomer royal, founded on a determination of the absolute latitude and difference of longitude of the two extremities. The difference of longitude was determined by the transfer of chronometers, by a very circuitous route, from one end to the other; after which the necessary computations were made, and marks laid off for starting with the line from both extremities. One party, after cutting more than 42 miles through the woods, were agreeably surprised on the brow of a hill at seeing before them a gap in the woods on the next line of hill, which opened gradually, and proved to be the line of the opposite party. On continuing the lines till they were abreast of each other, their distance was found to be 341 feet, a difference which arose in an error of only a quarter of a second of time in the difference of longitude. The performance of this operation reflects the highest honour on the officers engaged. Transits were observed, and observations made, on whose delicacy everything depended, when the thermometer was lower than 19 degrees below zero, and when the native assistants, though paid highly, deserted on account of the severity of the weather.

Such is a brief outline of an establishment which, whether we consider the nature and utility of its operations, or the comparatively small expense at which they are conducted, has great claims on our respect. We trust that our necessarily brief sketch will tend to diminish the stupid wonder with which the unpretending structure is regarded by thousands who climb the hill on which it stands. Let them think over its historical associations, and its importance not merely nationally, but in connexion with the whole world.

SHORT NOTES ON THE WEST INDIES.

BY A LATE RESIDENT

SECOND ARTICLE.

Travelling.—Travelling was at one time in the West Indies, it is said, so comfortable as to cost nothing. For instance, all that a respectable party had to do who desired to travel from one end of the island of Jamaica to the other, was to call in at the several estates on his way, when his horses would be cared for, himself provided with bed and board, and every attention paid him that he could require. These certainly must have been palmy days. I have heard of nothing like them at the present time: 'the more's the pity'; for the public inns are miserable, and their fare worse. I have frequently been unable to get a dinner at one of them, while it has been necessary to turn my horse out on the sides of the highway to feed, or to send my servant miles away to procure a blade of grass. Fried ham and eggs form in some places a standing dish; and the traveller considers himself fortunate if his host is enabled to present him with a chicken broiled, which little biped he had seen not half an hour before sporting in the fields, the same having been first hunted off its legs to be caught, and then hurriedly cooked.

The greatest pleasure connected with travelling in the West Indies is certainly derived from the magnificent scenery which bursts upon the view at every step. Cloud-capped hills, rugged rocks, lofty heights, deep precipices, broad savannahs, meandering streams, rushing rivers, verdant shades, outstretched seas, embosomed bays, blue-tinted skies, and all the ingredients which poetic imagination might require to present an enchanting prospect to the imagination, are visible by day, while the literally 'spangled firmament,' the clear bright moon, the countless lights proceeding from innumerable fire-flies, themselves invisible, and the lights appearing like a fairy illumination of a densely-populated fairy country—all render a journey delightful by night; and if the traveller be a stranger, they will probably lead him on to rapture. There are drawbacks, however, in travelling in the West Indies, which in some degree counterbalance all these pleasant sights, or which at any rate will in a short time diminish the amount of rapture which might have been occasioned. Rutty roads, narrow dangerous tracks, sandy beds, rugged 'gullies,' swollen rivers, rapid fordings, unwholesome lagoons, muddy ways, trackless waters, burning suns, and feverish airs, are sufficient, probably, to check any moderate person's excessive admiration. Still, however, there is little doubt that the balance is in favour of the pleasurable, as well as the healthy side of travelling, as far as nature is concerned. I cannot say as much for the conveniences dependent on man. Hotels, or rather inns, as I have already observed, are abominably bad, besides being scattered as widely apart as plums in schoolboys' pudding. Livery vehicles are of the most disgraceful kind, awkward, old, and shabby, while the cost of travelling, to those who do not journey in their own conveyances, and with their own horses, is sufficiently high. Not caring to use my own horse, I have often paid twenty-four shillings for a horse and chaise to go thirteen miles, besides expense of tollage, feed of horses, and gratuity to the boy. The traveller may, however, thank his stars if he have no more than these things to complain of. Should an accident happen to his horse or vehicle on the way, he would call 'spirits from the vasty deep' with as much success as a farrier from a forge, or a mender of chaises from a workshop. He would have no resource but to complete his journey on foot (unless some stray traveller, with a seat to spare, should pass by), leaving his vehicle and horse upon the road in charge of his servant.

The Militia.—Our colonists are inordinately fond of 'playing at soldiers'; and the truth is, where the mode of life is as monotonous as in the colonies, it is not very surprising that much devotion should be paid to that which, if it does nothing more, creates a little stir and excitement. And the morning of 'muster' is indeed a period of excitement to most militiamen, from the colonel-in-chief to the merest 'private.' Old stagers there are—men who have 'grown old in the service'—whom it would be as difficult to move out of their steady track as to stem the torrent of a hurricane: the great portion, however, yield to the excitement. As early, probably, as three o'clock on the morning of 'muster' a preparatory roll of the drum is heard, whereupon the young soldier starts from bed, strikes a light, puts on his 'accoutrements,' and, lest he should not be in time, rushes off to the parade with the utmost haste. There he takes his dark and solitary walk, pluming himself on his zeal, while the initiated, 'turning his sides and his heavy head,' snoozes on till five o'clock, when the drum is again beat, but on this occasion apparently more peremptorily. He then gets up, dresses leisurely, fortifies himself against a long drill with a cup of coffee, and quietly takes his march to the field. When he arrives, he probably finds that the rolls have been called.

He reports himself, however, to the serjeant of his company, who notes him 'present.' In consequence of these tardy arrivals, an hour after the appointed time probably elapses ere the companies are formed, which being done, the business of the morning commences. First, the serjeants under the direction of the commanding-officers of the companies see that the recruits have arranged the belts properly; that the men cover each other; that they are arranged according to gradations in height, &c. The commander of each company then puts his men through certain manœuvres; and, if he be a young officer, there is no reluctance on the part of the men to offer suggestions, nor on his to receive them. In fact, the most cordial understanding usually exists between the officers and men, holding the same rank as civilians which they very often do, and *aux-pas* on either side are leniently dealt with.

When the men have been formed into line, and have presented arms, &c. they generally pass in review, when the little inconsistencies of dress and inefficiencies of duty scarcely escape the detection and censure of the reviewing officer. 'What are you doing on that pivot, sir?' 'Good —, where is that company going to?' are exclamations which fall, like tropic rain, 'thick and fast.' Should the morning be devoted to the practice of firing, among other exercises, the circumstance adds much to the excitement, not simply of the soldier, but of the crowd of persons, particularly the young raggamuffins collected on the ground. The soldier is excited lest his whiskers should be carried away by the contents of his neighbour's gun, the crowd lest some accident should happen, and the raggamuffins from the hope of finding a cartridge or two of powder, dropped from the nervous hands of some of the soldiers, or scattered by stealth among the youngsters. On the subject of accidents—a soldier in haste, on charging his gun, once left his ramrod in it. A boy was shot through the body at the next discharge.

The men having been baked in the sun for three or four hours, a close column of companies is formed, and they are dismissed—very frequently to the stirring tune of 'Oh, be joyful.' Now, however, comes the reward of the young officer for the arduous toil he has undergone, and the uncomfortable position in which he has been placed. 'Tis then that, with span new coat, golden epaulettes, shining sword, stately step, and warlike glance, he struts on foot, or careers on horseback, through the town, acknowledging the encouraging smiles of fair friends, or, as he goes, exciting the admiration of the multitude. To return, however, to 'head-quarters.'

The 'colonel-in-chief,' or 'colonel,' of militia, as it may happen to be, is, as I have said, no unimportant personage. Each individual in the several communities being called upon after a certain age to do militia duty, and each being fined for non-attendance under the warrant of the colonel, or liable to be tried by court-martial for breach of duty, all feel it in some degree their interest to pay him proper respect, and many great deference. The promotions from the ranks, also, being made by the executive, at the suggestion or recommendation of the colonels, a mighty engine of power is at their command. No one who hopes for promotion must offend the colonel, and consequently the influence which he exercises in every department, whether military (military), civil, or mercantile, is overpoweringly great. And it may readily be believed that this influence is not always exercised in a fair, judicious, or disinterested spirit; and that, in the days of oppression, it was very often used as an engine to check the rising ambition, if not to crush the daring and independent spirit, of the coloured or black man. At the same time neither the public nor private character of many who held the rank of colonel would bear scrutiny on the point of honesty, sobriety, intelligence, or wealth. Since the abolition of slavery, a feeling has gone abroad against the militia, which will most probably end in the utter disbandment of the force.

The Coloured Clerk.—I have every reason to believe

that there are few classes in the West Indies—that land where oppression has been until late years the rule, and justice the exception—who have been more hardly dealt with than the coloured clerks. Descendants of Africa, as their name implies, yet often for generations freed from the bodily thralldom to which those were subject to whom they were so closely allied, they seemed fated, like them, to be the victims of a cruel prejudice and hopeless toil. Untiring and faithful labourers for their masters' interests, yet were they doomed to move in one ceaseless round of unthankful and pitiless servitude. The coloured clerk probably found his way at twelve or fourteen years of age into a merchant's office in this manner. His parents, or relatives, or friends, hearing of a vacancy in a particular counting-house, and having resolved that it was quite time the child should learn to do something for himself, would apply on his behalf for the situation. 'Salary being no object'—that is, the amount required being small, or probably nothing demanded for the first year—the probabilities were that the tender of the boy's services would be accepted. At the appointed time, therefore, he would enter the counting-house, and find perhaps half a dozen other clerks employed. Like their employers, they would be white, and as an amalgamation of the several classes was not even thought of, his situation would at once promise to be uncomfortable. He knew by intuition that the several views of 'matters and things' entertained by his fellow-clerks differed widely from his own, and the odds being against him, he would mentally anticipate many a hard struggle. However, it was a fine thing to be a merchant, and he had come to learn to be one. Courage, therefore, and, in despite of any trifling unpleasantness, diligence and attention would no doubt bring him to the goal. Without one positively gloomy apprehension, then, he would occupy the desk which had been assigned him, and enter upon his duties. Young as he was, however, he would speedily discover that his brother clerks courted neither his company nor his conversation. No familiar intercourse passed between them; and on retiring from business, it would happen daily that occasion called them in a separate direction from that which he intended to pursue. The result was, that very little communication passed between them beyond matters of mere business, and when they met in the streets, a nod of recognition was very often omitted. Thus would years pass on, and probably find the coloured clerk in the same counting-house, toiling amongst those with whom no bond of fellowship existed. He would probably have now no desire that it should exist, content, as it would appear, thus to work on until his period of promotion should arrive. He had hopes of promotion—that is, of being promoted to a share of his master's business. Rare as had been the occurrence when a coloured clerk was so promoted, he still hoped on; for he had spent the best days of his youth and manhood in the employment of the same master; and who knew what a day might bring forth? True it was that others had been, times out of number, placed above him in less important departments; that the last opening in the firm had been filled by one many years his junior: yet justice was not always blind, nor was the wheel of fortune always stationary. His turn must come some day, and then he would be content. Forlorn hope! The turn of the coloured clerk for promotion to a share in the business of his white master never came. Still, however, he hoped on. The paltry pittance which at length, as head clerk, he received, might have told a despairing tale; but he would hear nothing, see nothing, that would tend to deprive him of this hope—this one hope of his weary life. When hope ultimately deserted, him, he not unfrequently sought consolation in the bottle, and sank prematurely to the grave. The community placed the termination of his hapless career to the account of dissipated habits; but a nearer insight into the matter would have shown that it was the result of that 'hope,' which, 'long deferred, maketh the heart sick.' The evil here depicted, though not so glaring

at the present day; is still a marked feature of the colonial system.

Negro Amusements.—Passing over many which are not different from the amusements indulged in by their white brethren, I come at once to the favourite dancing associations of the negroes, known under the odd names of *Setts* and *John Canoes*. The John Canoe parties, composed exclusively of men, are marked by frequent tumults, sometimes leading even to bloodshed. The *Setts*, which are composed of women, bear also marks of a barbarous origin, the leader or mistress being furnished with a whip with which to flog any inactive member. There is a description of John Canoe termed 'the actors,' who do not dance, but recite portions of plays in a pompous and mouthing manner. Like the *Setts*, they claim the privilege of entering houses, and must therefore be placed in the first rank. The other John Canoes, of which many kinds perambulate the streets, dance to the sound of drums, fifes, &c. They all wear masks, either beautiful or ludicrous, as occasion calls for. The *Setts*, composed of probably a dozen women, are accompanied by a violin and tambourine, and occasionally a 'Jack in the green,' which constantly revolves to the sound of music; while the 'girls,' with parasols in their hands, their dresses floating in circles in the air, whirl round with inconceivable rapidity as they traverse the streets, singing in a most clamorous key some unintelligible ditty composed for the occasion; such as

'Good mornin', sista Sue,
And how is Breda Challe?
Go, tell sista Quabna,
Fe put on de peppa pot.
Sing debe, debe, doo,
Sing glory to Hallelu.'

Or the following, called 'Monkey loss him tail, hold him!':—

'You worry me, you tease me,
You make my dandy leah me;
Jackass wid de lang tail,
And de bigue a cocoo coming down.'

John Canoeing and *Sett* Dancing—in the days of slavery much patronised by masters and mistresses—usually take place, where still kept up, at Christmas. Independently of affording amusement to the lower classes, they are systems of levying money which frequently prove very successful. No John Canoe or *Sett* will dance unless payment is given; and in addition to money, they are often presented with wine, &c. What is the origin of their separation into parties I have never heard; but there is always a blue and a red party, which vie with each other in the magnificence of their dress; and a certain day being appointed, a judge declares which party has excelled the other in splendour or taste. A blue and red John Canoe of any importance never meet without a conflict; but the struggle which takes place on each side is rather to destroy each other's dress than to damage each other's person. The like occurrence takes place among the *Setts*, which are also divided into reds and blues; and as its women are very expert at the matter, a very few seconds sometimes suffice to make every shred of finery disappear. Why the demon of destructiveness should enter so completely into the character of these representations, it is difficult to conceive. The dresses on either side, although sometimes tawdry, are expensive, and large sums must be lost by them.

One might be led to conceive, that amid all the noise and license which naturally attend these amusements, many scenes of rioting and drunkenness occur. The contrary is the case; for, with the exception of the squabbles between the 'reds and blues'—sufficiently unseemly however—nothing of the kind occurs. The negroes are by no means addicted to strong liquors—the chief incentive to broils and bloodshed. A great evil attendant on these amusements, however, is, that many unprincipled dancers resort to thieving about the approach of Christmas, in order to be enabled to dress

with sufficient splendour. This and other objections which may be readily conceived, have given rise to much opposition to the amusements; and in a few years they will be more properly numbered among the things that were. In part, they have been already put down; not, however, without the shedding of blood.

A Watering-Place.—I would take you with me in imagination to the shore, or rather to the beach, which hems in one of the largest and most commodious harbours in the West Indies. The sea plays in tiny ripples at our feet, by turns displacing and replacing the shells and shingle which lie scattered around. A slight breath fans our cheek; but looking seaward, we perceive a white foam cresting the tiny waves, and know that this slight breath is but the precursor of the coming 'sea-breeze.' Nearer and nearer it comes; the undulating motion of the waters increase; and each wave seems to rise in order more fully to catch the influence of the stirring blast. The ripples no longer play modestly at our feet, but becoming bolder and bolder, seem offering to gird us round. Here, then, we may no longer remain. We come to gaze on the hills and sky, and deep blue waters, and not to bathe our frame in those waters, however grateful and reviving. Yonder is a projection, stretching some three hundred feet into the harbour, along which water from the adjacent springs issues at stated times for the supply of less favoured places. There we may gaze, undisturbed, at the combination of enchanting objects which lie spread before us. Let us take our stand, then, and note the soft beauty of the distant hills, the bright serenity of the azure sky, and the broad expanse of the clear water, with the things upon and beneath it. The water comes in undulating swells, and with a gentle rushing noise beats against the supports of the projection on which we stand, and, breaking, flows onwards towards the shore. Around the supports is seen a host of the finny tribe gamboling in the clear element, now diving downwards, then glancing nimbly through each other's ranks, occasionally rising to the surface. Seaward appears a long arid strip of land, connected with the main on the left, that is, to the east, and stretching on to the right till lost to view. That strip of arid land—but two hundred odd feet across in certain parts, and not twice the number in any one from the broad bosom of the Caribbean sea to the waters of the harbour—has withstood the tempests of five thousand years, and the surging of a myriad of billows. A town, the relic of that which existed previous to a vast upheaving of the earth, and an awful conflagration, occupies its extreme point. Beyond, till lost in the haze of distance, the harbour stretches apparently in interminable length, and in the intermediate space are seen canoes and boats of varied rig and form, their white sails swelling with the breeze, and themselves dancing with a light careering motion over the ruffled surface of the dark-blue water. Now turn we to the land. On the main, to the right, lies a fort of no formidable front or impregnable build. Its whitened turrets and sea-girt walls give it, however, a sufficiently imposing appearance. To the right, as far as the eye can reach—beyond, as far as the gaze may scan—to the left, as far as it may pierce, rise in unspeakable and varied simplicity, dignity, and grandeur, one hundred hills, capped with snow-white clouds, or clad in garb of mingled green and russet, in either case reflected to the eye with the softness of richest velvet. At no great distance from the shore-end of the projection on which we stand lies the public highway, thronged with passengers on foot, in carriages, and on horseback. Here rolls the carriage of the rich, there the gig of the less aspiring; here a horseman spurs his mettled charger, there a negro trudges it on foot, urging on his ass, laden with provisions, he himself bearing a basket-load on his head; while women, with petticoats tucked up, ankles, calves, and knees bare, haste on, heedless of shoes or stockings, with burdens on their heads and young children on their backs. A small stream crosses the road on the left. Up the stream is observed a host

of half-dressed chattering women, engaged in no very romantic occupation. A strange banging noise is heard—the women are beating the clothes given them to wash—that being the process usually employed to cleanse them. No mercy have they on the owners' pockets, no consideration for their garments. Leaving them, however, we observe still farther to the left a pleasantly situated little house, somewhat retired from the road. We find no difficulty in ascertaining its character; there, then, when we have satisfied our gaze with the prospect which surrounds us, we will resort and seek refreshment, satisfied if we obtain it but in the shape of 'so-so' water.*

Negro Appellations.—The negroes in the West Indies are much in the habit of giving such names to the animals which belong to them, or the small properties which they possess, as shall denote some particular event, or record some particular fact. I have been told of a pig that was named 'Good me do, tankee me get,' being the words of one of the negro proverbs, and intended no doubt to perpetuate some act of ingratitude towards the owner of the pig. Another was named 'Try, see,' that is, 'make a trial,' probably a trial whether the breeding of pigs would not be profitable. Within late years, the source from whence the negroes obtained the means wherewith they purchased their small properties, is sometimes pointed out by the name given to the settlement, as 'Carting.' Sometimes the opportunity of carrying on the culture is indicated by the appellation 'Occasion Hall,' and sometimes 'the spirit which led them to clear the wilderness, and to plant there a garden,' is shown in the name 'Endeavour' and 'Freeman's Hut.' In their appellations, also, the shrewdness of the negro, mingled with the quaintness observable in the above examples, shows itself. A certain woman of that class had a violent husband, who quarrelled with her upon every possible opportunity. Too timid to take any direct means to procure peace, the woman resorted to an appellation for her dog. The dog was styled 'Begin,' and thus, whenever she perceived the approach of an outbreak of her husband's temper, she would cry out, apparently addressing the dog, but in reality her husband, 'Begin, Begin, Begin,' till at length her boisterous mate became ashamed to 'begin,' and was thus cured of his quarrelsome propensity. This story is good enough, but not equal to that which describes a forlorn damsel as giving her dog the appellation of 'Little did I thought that man was so deceitful.'

The Way to Rise.—It is unnecessary to state that innumerable instances occur in the colonies where parties who left this country in the most subordinate situations, or walking in the humblest ranks of life, have risen to the highest offices, and become possessors of the greatest wealth. Needy footmen have become large traders, and sons of the needle presidents of council. Far be it from me to reflect dishonour where no dishonour is. Too many cases occur, however, where the men who have so risen have not been *sans reproche*, and were an inquiry instituted only into the item of the administration of bygone executorships, I fear that a tale would be told of orphans plundered, widows ruined, and property usurped or unaccounted for, that would pass the present limits of our credulity. On the other hand, self-denial and unswerving integrity have been occasionally used, and successfully so, as a means of advancement to wealth and importance. In the West Indies, as in other countries, the Scotch very often prove more cautious, provident, and enterprising than other Europeans; and, ever extending a helping hand to each other, they seldom fail to 'get on in the world.' I know not whether to regard it as creditable or discreditable to that people, that in some parts of the West Indies a tall, leafless, barren trunk of the majestic cotton tree—ascended from its base by a small creeping plant, which, increasing in

vigour and size as it grows, saps the juices of the fostering tree till it ultimately rears its triumphant head above the barren trunk—is shown to the passing traveller as 'the Scotchman hugging the Creole.'

PEPPER AND MUSTARD.

HUMAN life, though a great and momentous affair, is the sum and result of many little and apparently insignificant arrangements. Who, without experience, could think that pepper and mustard could materially influence our enjoyments—could affect, even in a moral point of view, either the head or the heart? Yet so it is—these little things are great to little men.' Suppose that we are set down to dinner, and that we have been helped to some hot and savoury soup; we take up the pepper-box, but find it either empty, or half filled with large particles which will not pass through; or if it contains a supply of good pepper, the holes are so stuffed up that not a particle can make its escape; or, what is still worse than all, the lid has been so carelessly put on, that the moment we begin to use it, off it tumbles, and the whole contents of the cruel fall into our plate at once. Or, on the other hand, suppose that we have been presented with a plate of beef; the mustard-pot is empty, or it is partially filled with the rancid remains of a former day, dirtily clogged around the sides and top of it; or it may be filled with a thin tasteless fluid, the result of a hasty dash of water put into the half-empty vessel before dinner. It may not even be found on the table at all; and, after several times calling for it, and during the time lost in going for it or searching it out, you are obliged silently to eat your beef without the aid of its stimulating flavour. If, on the contrary, you are resolved to wait its appearance, your patience and temper undergo a severe trial, and your keen appetite is lost in the anxiety of hope deferred, while the tedious process is gone through of procuring a fresh supply. First of all, the keys have to be found; or, it may be, the key which opens the work-basket which contains the key which opens the closet which contains the shelf where, huddled among a dozen heterogeneous packages, the paper containing the mustard powder is to be found. Then this powder, which has lost more than half its pungency by being kept in paper instead of a stone jar, has to be hurriedly mixed up with water, and is brought at last, after a world of delay, with large knots of dry powder interspersed among the half-liquid mass. If, under the same auspices, you should dine day after day at the same table, it is ten to one but the same neglects are repeated. If you should ask for pickles to your beefsteak, they also will have to be waited for in the same manner; or if on the table, they will in all probability contain a metallic spoon, the action of the acid on which producing a poisonous mixture, will effectually deter you from partaking of them. In short, these little arrangements are an index of the mind of the presiding mistress. It may sometimes be the fault of the servants; but the omissions of servants, unless they are incorrigible, more frequently depend on the guiding spirit of the house than on their own peculiar faults. When one sees the arrangements of the table perfect, even including the well-filled, clean, and inviting mustard-pot, he may be assured that all the other most important departments of domestic management are in their proper order. 'My dear,' says Mrs Slovenloof, 'why should you vex and fret yourself so about such a trifle as the omission of the mustard? How often do you tell me not to fret myself about trifles! Besides, I do not think either pepper or mustard agrees with you; and I have been reading lately that too much of such things is unwholesome.' 'Yes, too much of anything is unwholesome; but what do you say to too little, or none at all?' 'I have read, my dear,' retorts Mrs Slovenloof, 'that man in a state of nature requires none of these things; that half-broiled beef or venison, of which you so often complain, is de-

* 'So-so' water means pure water, in contradistinction to spirits and water.

voured by the savage without salt, or pepper, or anything else, and reckoned a most savoury meal; and I do think, that all the niceties of cookery are very useless, and I am sure they are very, very troublesome!' 'The savage,' replies the husband, 'takes his food thus because his squaw knows no better; but depend upon it, did she present him with a well-cooked and well-seasoned mess, he would eat it with a double relish, and thrive under it too, in a way quite different from what he does under his ill-cooked fare. But even your instance of the savage is an unfortunate one. Your "man of nature" is just as fond of aromatics and other stimulants as a civilised man. Witness his avidity for salt, for aromatic and bitter roots and herbs, for the intoxicating cava, for beer, for tobacco. Nay, if we stoop to the analogy of the lower animals—whose appetites you will allow are under the guidance of unerring instinct—we shall find that they, too, are equally incited by appetite to take along with their food stimulants, such as salt and aromatic herbs and roots.' Mrs Slovenloof, however, was unwilling to be convinced. There are none more fertile in evasive excuses than the really indolent and negligent; and she spun out the argument for two hours after dinner, advancing, however, nothing but commonplaces in support of her theory, till at last she unconsciously gave it a practical deathblow, by partaking freely of both tea and coffee in the evening; both of which, according to her view of the question, were equally unnecessary as pepper and mustard.

BIOGRAPHIC SKETCHES.

DR ARNOLD.

THE profession, avocations, and retirement-loving temperament of the late Dr Arnold, have prevented his name from being so widely known as that of many a less worthy candidate for public honours. It may be, therefore, necessary to inform our readers that he was a doctor of divinity, head master of Rugby school, and professor of modern history at the university of Oxford. His literary fame chiefly rests upon his *History of Rome*, his edition of the historian Thucydides, his *Lectures on Modern History*, and seven volumes of *Sermons*. It is, however, in the character of a school-master that his name will be most revered and respected by posterity; for to him we are indebted for great improvements in the management of the public schools of England.

Thomas Arnold was a native of West Cowes, in the Isle of Wight, of which port his father was for many years collector of customs. He was born on the 13th of June 1795, and at an early age was sent to Warminster, in Wiltshire, to school; thence he went to Winchester. In 1811, when only sixteen, he was elected a scholar of Corpus Christi College, Oxford; and when only twenty, became a fellow of Oriel College. Though he was ordained a deacon, he did not obtain a living in the church, but settled at Laleham, in Berkshire, and marrying soon after Miss Mary Penrose, the sister of a college companion, received into his house nine young gentlemen to prepare them for the universities. Upon these pupils he commenced that improved system of moral and intellectual culture which he so successfully practised at Rugby. He constantly instilled into them the wholesome principle, that good honest work is, after all, the only respectable calling. At the close of 1827, the head-mastership of Rugby school becoming vacant, he was elected to the office solely from the weight of the testimonials in his favour. The event proved that few men were better qualified for the office. It was, in fact, remarkably suited to his natural tastes. Tuition was always to him a labour of love; and this love grew so strongly upon him, that he some-

times declared he could hardly live without some such employment.*

Rugby—situated on the classic river Avon in Warwickshire—is one of the principal foundation schools selected by the aristocracy for the education of their boys. It was founded in 1657 by Laurence Sheriffe, citizen of London, a native of the neighbourhood. Any person who has resided during two years in, or within ten miles of, the town, may send his sons to be educated, free of expense; in other words, he may place them 'on the foundation.' Other pupils pay a fee, and are obliged to lodge at some of the boarding-houses in the town, or with one of the masters, of whom, besides the chief, there are eight classical tutors, with subordinate teachers of writing, French, and the mathematics. The number of pupils in Dr Arnold's time may have been about three hundred, sixty or seventy of whom were on the foundation.

On entering upon his duties, Dr Arnold found the school 'quite enough to employ any man's love of reform.' The boarding-house system, withdrawing as it did the boys from the supervision of the masters, was fraught with evils. We may here state, that this disadvantage still exists to a great extent at other public schools where they refrain from naming, and cannot be too strongly reprehended. Boys of from thirteen to fifteen are supplied by their wealthy friends with incomes infinitely larger than they can spend wholesomely either for body or mind.† When out of school, they are nearly bereft of control, assume the manners and habits of men, and ape their vices; amongst which it is painful to state, that drunkenness and gaming are not unfrequently predominant.

Such practices were found to exist at Rugby when Dr Arnold was called to preside over the school. They naturally shocked and alarmed him; and he determined to strike at the root of the evil by insisting that all the masters should take boarders, so that at all times the pupils might be under their supervision, and that the irresponsible boarding-houses should 'die a natural death.' He also introduced an elaborate system of private tuition, by means of which he established a pastoral and friendly intercourse between the masters and the boys under their care. He had another terrible evil to combat with, which was a marked abuse of the 'fagging system' instituted in all the public schools of England. The merits or demerits of this system have long formed a subject of controversy, into which, however, it is no business of ours to enter. It mainly consists in rewarding boys who have attained proficiency in learning—who are, in fact, the head pupils of the school—by giving them certain powers over the junior boys, who are bound to obey them in everything—in whatever, even, may be extra scholastic. It is manifest that these powers, placed in hands guided by young heads and impulsive hearts, are liable to great abuse. Dr Arnold did not attempt to alter the system, neither did he wish to do so.‡ 'Another,' he said, 'may be better in itself; but I am placed in this system, and am bound to try what I can make of it.' In other words, he determined to use, and to improve to the utmost, the existing machinery of the sixth form and of fagging; understanding, by the sixth form, the thirty boys who composed the highest class—'those,' he would say, 'who, having risen to the highest form in the school, will probably be at once the oldest, and the strongest, and the cleverest; and, if the school be well ordered, the most respectable in application and general character.' How he set about the well ordering of the school by

* *Life and Correspondence of Thomas Arnold, D.D.*, by Rev. A. P. Stanley, fellow and tutor of University College, Oxford. 2 vols. London: Fellowes. 1844.

† We know an instance of two Eton boys who were allowed by their family eight hundred a-year between them!

‡ Dr Arnold was in favour of fagging as a system, and drew down a vast amount of public censure by his advocacy of it. His views on the subject may be seen in the ninth volume of the *Journal of Education*. They were replied to in the succeeding number by the editor of that work.

means of the preceptors or pupils composing the sixth form, furnishes one of the most interesting chapters in his life. In the first place, he continually impressed upon these thirty young gentlemen the notion, that they were as much his and his fellow-teachers' coadjutors in the government of the school as pupils. 'You should feel,' he once remarked, 'like officers in the army or navy, whose want of moral courage would indeed be thought cowardice.' He tried every means in his power to attract their affections and confidence rather than to excite their awe. He would, for instance, never seem to doubt what any one of them asserted. 'If you say so, that is quite enough—of course I believe your word,' and there grew up in consequence a general feeling that 'it was a shame to tell Arnold a lie—he always believes one.' He wished to lead rather than to drive his pupils into the ways of morality and learning. 'Is this a Christian school?' he indignantly asked at the end of one of those addresses in which he had spoken of an extensive display of bad feeling amongst the boys, and then added, 'I cannot remain here if all is to be carried on by constraint and force; if I am to be here as a jailer, I will resign my office.' When any boy was found to be confirmed in wicked habits, he expelled him at once. 'It is not necessary,' he told the assembled scholars on one such painful occasion, 'that this should be a school of three hundred, or one hundred, or of fifty boys; but it is necessary that it should be a school of Christian gentlemen.' In fact, his main principle, after expostulation and kindness, was the separation of the bad from the good. He had no liking for mere cleverness, however great the talents of a troublesome and vicious boy might be; while to a naturally dull but persevering pupil he gave every encouragement. At Laleham he had once got out of patience, and spoken sharply to a pupil of this kind, when the pupil looked up in his face, and said, 'Why do you speak angrily, sir? indeed I am doing the best that I can.' Years afterwards he used to tell the story to his children, and said, 'I never felt so much ashamed in my life—that look and that speech I have never forgotten.' And though it would of course happen that clever boys, from a greater sympathy with his understanding, would be brought into closer intercourse with him, this did not affect his feeling, not only of respect, but of reverence to those who, without ability, were distinguished for high principle and industry. 'If,' he observed on one occasion 'there be one thing on earth which is truly admirable, it is to see God's wisdom blessing an inferiority of natural powers, where they have been honestly, truly, and zealously cultivated.' In speaking of a pupil of this character, he once said, 'I would stand to that man *hat in hand*.' In those who did their work 'with a will,' and kept the straight line of moral conduct pretty evenly, he took an interest which lasted far longer than their Rugby pupilage. 'To any pupil,' remarks his classical and elegant biographer, 'who ever showed any desire to continue his connexion with him, his house was always open, and his advice and sympathy ready. No half year, after the four first years of his stay at Rugby, passed without a visit from his former scholars: some of them would come three or four times a-year; some would stay in his house for weeks. He would offer to prepare them for their university examinations by previous examinations of his own; he never shrunk from adding any of them to his already numerous correspondents, encouraging them to write to him in all perplexities. To any who were in narrow circumstances, not in one case, but in several, he would at once offer assistance, sometimes making them large presents of books on their entrance at the university, sometimes tendering them large pecuniary aid, and urging to them that his power of doing so was exactly one of those advantages of his position which he was most bound to use. In writing for the world at large, they were in his thoughts, "in whose welfare," he said, "I naturally have the deepest interest, and in whom old impressions

may be supposed to have still so much force, that I may claim from them at least a patient hearing." And when annoyed by distractions from within the school, or opposition from without, he turned, he used to say, to their visits as "to one of the freshest springs of his life."

Though, upon a principle he had formed for himself in school government, and from inclination arising from a sympathy with the intellectual and the good, Dr Arnold's chief and most unwearied cares were bestowed on the head boys, yet he was not unmindful of the juniors. Though a severe and firm disciplinarian, 'the liveliness and simplicity of his whole behaviour must always have divested his earnestness of any appearance of moroseness and affectation. "He calls us *fellows*," was the astonished expression of the boys when, soon after his first coming, they heard him speak of them by the familiar name in use amongst themselves; and in his later years they observed with pleasure the unaffected interest with which, in the long autumn afternoons, he would stand in the school field, and watch the issue of their favourite games of football.—With the very little boys, indeed, his manner partook of that playful kindness and tenderness which always marked his intercourse with children; in examining them in the lower forms, he would sometimes take them on his knee, and go through picture-books of the Bible or of English history, covering the text of the narrative with his hand, and making them explain to him the subject of the several prints.'

The life and correspondence of Dr Arnold show us that no man ever studied so constantly, or knew so completely, every corner of the mind of boys. He seemed to know well the thoughts and characters of every pupil in the school—those of his favourite preceptors thoroughly. The searchingness of his practical insight into boys was such, that, in the words of one of his scholars, 'when his eye was upon you, he looked into your inmost heart.' This, then, was precisely the man to carry a thorough reform into a public school. Looking, therefore, at Dr Arnold in his true character, namely, that of a schoolmaster, it is one of the most complete and perfect in the range of biography; and the public owe much to his friend and pupil Stanley for presenting it in so clear, so impartial, so true a light.

But Arnold was something more than a schoolmaster. A man of extensive sympathies, he promoted, by every means in his power, whatever would generalise education amongst the people. His writings and sermons abound with pictures of the distresses of the poor, and urgent appeals to his auditors and readers for their relief. As a literary man, his tastes were decidedly for geography and history. His edition of Thucydides, and his History of Rome, in which—sometimes following Niebuhr, and sometimes striking out a new and bright light of his own, across the 'dim vista of antiquity'—he separates the fabulous from the really historical, have already established him in the highest rank of historians. His sermons are manifestly the offspring of a practical Christianity which would do good to all men. His piety was not a mere sentiment; it was an active philanthropy, which would have embraced all men within its influence, so as to lead them as well as himself 'upward.'

The mere incidents in such a life as that of Dr Arnold are too few and tame to be interesting, and are only enlivened by occasional excursions abroad; for he was passionately fond of travelling. In 1825 he visited Italy, and in 1827 explored every corner of Rome, to which his historical tastes and knowledge gave a peculiar charm. His latest tour was in France in 1841. In the same year he was offered the professorship of modern history at Oxford—the great triumph of his life. Dr Arnold had in former years been extensively unpopular amongst the Oxford authorities for certain principles concerning church matters, which he vehemently advocated; again, from the laity he had received every

species of censure for his unflinching defence of the 'fagging system' in public schools. His unpopularity melted away before the overwhelming balance of good which existed in his character, both as a divine and as a preceptor: the Oxford authorities made him one of their professors, and the public have since acknowledged this his *practised* school system was the true one, despite his strong, but purely *theoretical* advocacy of fagging; and 'the services which he rendered both to Rugby, and to the cause of public education generally, are now fully acknowledged, and cannot probably be too highly estimated. Not so much among his own pupils, nor in the actual scene of his labours, as in every public school throughout England, is to be sought the chief and enduring monument of Dr Arnold's head-mastership at Rugby.'

The year after he became an Oxford professor, and the fourteenth of his Rugby mastership, was, alas! his last. The story of his death is thus affectingly told. On Sunday morning, June 1842, Dr Arnold, who had been previously no more than slightly indisposed, 'awoke with a sharp pain across his chest, which he mentioned to his wife, on her asking whether he felt well, adding, that he had felt it slightly on the preceding day, before and after bathing. He then again composed himself to sleep; but her watchful care, always anxious, even to nervousness, at the least indication of illness, was at once awakened; and on finding from him that the pain increased, and that it seemed to pass from his chest to his left arm, her alarm was so much roused from a remembrance of having heard of this in connexion with angina pectoris, and its fatal consequences, that, in spite of his remonstrances, she rose and called up an old servant, whom they usually consulted in cases of illness. She observed him, as she was dressing herself, lying still, but with his hands clasped, his lips moving, and his eyes raised upwards, as if engaged in prayer, when all at once he repeated, firmly and earnestly, "And Jesus said unto him, Thomas, because thou hast seen thou hast believed; blessed are they who have not seen, and yet have believed;" and soon afterwards, with a solemnity of manner and depth of utterance which spoke more than the words themselves, "But if ye be without chastisement, whereof all are partakers, then are ye bastards and not sons." From time to time he seemed to be in severe suffering; but to his wife he uttered no expressions of acute pain, dwelling only on the moments of comparative ease, and observing that he did not know what it was. But the more than usual earnestness which marked his tone and manner, especially in repeating the verses from scripture, had again aroused her worst fears; and she ordered messengers to be sent for medical assistance, which he had at first requested her not to do, from not liking to disturb at that early hour the usual medical attendant, who had been suffering from indisposition. She then took up the prayer book, and was looking for a psalm to read to him, when he said quickly, "The fifty-first," which she accordingly read by his bedside, reminding him, at the seventh verse, that it was the favourite verse of one of the old alms-women whom he was in the habit of visiting.' Of the physician who was called in, Dr Arnold calmly inquired, 'Is it (the disease) generally suddenly fatal?' 'Generally.' On being asked whether he had any pain, he replied that he had none but from the mustard plaster on his chest, with a remark on the severity of the spasms in comparison with this outward pain; and then, a few moments afterwards, inquired what medicine was to be given; and on being told, answered, 'Ah, very well.' The physician, who was dropping the laudanum into a glass, turned round, and saw him looking quite calm, but with his eyes shut. In another minute he heard a rattle in the throat, and a convulsive struggle—flew to the bed, caught his head upon his shoulder, and called to one of the servants to fetch Mrs Arnold. She had but just left the room before his last conversation with the physician, in order to acquaint her son with his father's danger, of which he was still unconscious, when she

heard herself called from above. She rushed up stairs, told her son to bring the rest of the children, and with her own hands applied the remedies that were brought, in the hope of reviving animation, though herself feeling, from the moment that she saw him, that he had already passed away. He was indeed no longer conscious. The sobs and cries of his children, as they entered and saw their father's state, made no impression upon him—the eyes were fixed—the countenance was unmoved: there was a heaving of the chest—deep gasps escaped at prolonged intervals; and just as the usual medical attendant arrived, and as the old school-house servant, in an agony of grief, rushed with the others into the room, in the hope of seeing his master once more—he breathed his last.

It must have been shortly before eight A.M. that he expired, though it was naturally impossible for those who were present to adjust their recollections of what passed with precise exactness of time or place. So short and sudden had been the seizure, that hardly any one out of the household itself had heard of his illness before its fatal close. His guest, and former pupil (who had slept in a remote part of the house), was coming down to breakfast as usual, thinking of questions to which the conversation of the preceding night had given rise, and which, by the great kindness of his manner, he felt doubly encouraged to ask him, when he was met on the staircase by the announcement of his death. The masters knew nothing till the moment when, almost at the same time at the different boarding-houses, the fatal message was delivered, in all its startling abruptness, "that Dr Arnold was dead." What that Sunday was in Rugby it is hard fully to represent: the incredulity—the bewilderment—the agitating inquiries for every detail—the blank, more awful than sorrow, that prevailed through the vacant services of that long and dreary day—the feeling as if the very place had passed away with him who had so emphatically been in every sense its head—the sympathy which hardly dared to contemplate, and which yet could not but fix the thoughts and looks of all on the desolate house where the fatherless family were gathered round the chamber of death.'

'THE CLAIMS OF LABOUR.'

'The Claims of Labour' is 'an essay on the duties of the employers to the employed,' recently published in a small volume [Pickering, London] by a gentleman who withholds his name, but who has already attracted some notice by a book of beautiful and pleasant thought, entitled 'Essays Written in the Intervals of Business.' The present volume has rather too much of a dilettante air; yet it is evidently, too, the production of one who has given his mind earnestly to the subject, and writes not unadvisedly. Starting with the fact, now becoming so generally acknowledged, that the condition of the working-classes in this country presents many features of a distressing kind, he asks, 'Is this the inevitable order of things?' He answers, Pagans might believe so. 'But we cannot doubt that the conditions of labour, under which ~~man~~ ^{man} tills the earth, express the mercy and goodness, not ~~the~~ ^{the} judgment of God.' He does not, however, believe that merely increase of employment and better wages would put things quite right. There is requisite 'an earnest and practical application, on the part of the employing class, of thought and labour for the welfare of those whom they employ.' A foreign enemy hanging on our shores, would concentrate all our energies in their defence; why should not the same zeal be displayed in meeting the 'domestic evils' which stand as threateningly around us? 'It seems to me,' he says, 'a thing far more to be dreaded, than any considerable part of our population should be growing

up in a state of absolute ignorance, than would be the danger, not new to us, of the combined hostility of the civilised world.'

He appeals not, however, to 'a man's apprehension of personal loss or suffering, but his fear of neglecting a sacred duty.' 'It will be found,' he adds, and here we cordially concur with him, 'that the highest motives are those of the most sustained efficiency.' He calls on the Masters of Thought—namely, the literary men of England—to ascend above frivolous pursuits, and look to the great interests of Man as their noblest field. He demands of the government at least the appointment of men of suitable ability for all offices bearing upon popular interests, and the selection for honours of men who prove of service in this matter. Let the rich not be looked to alone for effort or sacrifice. I take, says he, 'some member of that large class of persons who are not rich, nor great employers of labour, nor in any station of peculiar influence. He shudders as he reads those startling instances of suffering or crime in which the distress and ignorance of the labouring population will occasionally break out into the notice of the world. "What can I do?" he exclaims. "I feel with intensity the horrors I read of: but what can one man do?" I only ask him to study what he feels. He is a citizen. He cannot be such an isolated being as to have no influence. The conclusions which he comes to, after mature reflection, will not be without their weight. If individual citizens were anxious to form their opinions with care, on those questions respecting which they will have to vote and to act, there would be little need of organised bodies of men to carry great measures into effect. If those who have actively to distribute the labour of the world knew that you, the great mass of private men, regarded them not for their money, but for their conduct to those in their employ, not for the portion which they may contrive to get for themselves, but for the wellbeing which they may give rise to, and regulate, amongst others; why, then, your thoughts would be motives to them, urging them on in the right path.' Your own treatment of any one dependent on you may also tell. And here even more consideration may be required. 'It is a sad thing for a man to pass the working part of his day with an exacting, unkind master: but still, if the workman returns at evening to a home that is his own, there is a sense of coming joy and freedom which may support him throughout the weary hours of labour. But think what it must be to share one's home with one's oppressor; to have no recurring time when one is certain to be free from those harsh words, and unjust censures, which are almost more than blows, ay, even to those natures we are apt to fancy so hardened to rebuke. Imagine the deadness of heart that must prevail in that poor wretch who never hears the sweet words of praise or of encouragement. Many masters of families, men living in the rapid current of the world, who are subject to a variety of impressions which, in their busy minds, are made and effaced even in the course of a single day, can with difficulty estimate the force of unkind words upon those whose monotonous life leaves few opportunities of effacing any unwelcome impression. There is nothing in which the aid of imagination, that handmaid of charity, may be more advantageously employed, than in considering the condition of domestic servants. Let a man endeavour to realise it to himself, let him think of its narrow sphere, of its unvarying nature, and he will be careful not to throw in, unnecessarily, the trouble even of a single harsh word, which may make so large a disturbance in the shallow current of a domestic's hopes and joys.' These are just and laudable sentiments, beautifully expressed.

The great employers of labour—'would that they all saw the greatness of their position. Strange as it may sound, they are the successors of the feudal barons; they it is who lead thousands to peaceful conquest, and upon

whom, in great measure, depends the happiness of large masses of mankind. Can a man, who has this destiny intrusted to him, imagine that his vocation consists merely in getting together a large lump of gold, and then being off with it, to enjoy it, as he fancies, in some other place: as if that, which is but a small part of his business in life, were all in all to him; as if, indeed, the parable of the talents were to be taken literally, and that a man should think that he has done his part when he has made much gold and silver out of little.' Something more is required—a benevolent superintendence of the interests of the employed, where from any cause it is needed, or may be found desirable. The author urges the duty of not working for worldly success alone, in some sentences truly eloquent. 'Consider the prospect which each unveiled night affords us, telling of wonders such as we have hardly the units of measurement to estimate; and then think how strange it is that we should ever allow our petty personal possessions of to-day to render us blind to the duties, which, alone, are the great realities of life. There was some excuse, perhaps, for the men of olden time, who looked upon this earth, the birthplace of their gods, as no mean territory. That they should dote upon terrestrial things, was not to be wondered at. But what is to be said for us who know that this small planet is but a speck, as it were, from which we look out upon the profusion of immensity? To think that a man who knows this, should nevertheless not hesitate to soil his soul, lying here, cringing there, pursuing tortuous schemes of most corrupt policy; or that he should ever suffer himself to be immersed, innocently, if it may be so, in selfish, worldly pursuits, forgetful of all else; when, at the best, it is but to win some acres of this transitory earth, or to be noted as one who has been successful for himself. The folly of the gambling savage, who stakes his liberty against a handful of cowrie shells, is nothing to it.'

Patience is necessary, and a resolution to battle with disappointment. 'For similar reasons, I would have you take care that you do not adopt mere rules, and seek to impress them rigidly upon others, as if they were general principles, which must at once be suitable to all mankind. Do not imagine that your individual threads of experience form a woven garment of prudence, capable of fitting with exactness any member of the whole human family.' * * 'There is nothing which a wise employer will have more at heart than to gain the confidence of those under him. The essential requisites on his part are truth and kindness. These qualities may, however, belong in a high degree to persons who fail to gain the confidence of their dependents. In domestic life, confidence may be prevented by fits of capricious passion on the part of the ruling powers; and a man who, in all important matters, acts justly and kindly towards his family, may be deprived of their confidence by his weakness of temper in little things. For instance, you meet with persons who fall into a violent way of talking about all that offends them in their dependents, and who express themselves with as much anger about trivial inadvertencies as about serious moral offences. In the course of the same day that they have given way to some outbreak of temper, they may act with great self-denial and watchful kindness; but they can hardly expect their subordinates to be at ease with them. Another defect which prevents confidence, is a certain sterility of character, which does not allow of sympathy with other people's fancies and pursuits. A man of this character does not understand any likings but his own. He will be kind to you, if you will be happy in his way; but he has nothing but ridicule or coldness for anything which does not suit him. This imperfection of sympathy, which prevents an equal from becoming a friend, may easily make a superior into a despot. Indeed, I almost doubt whether the head of a family does not do more mischief if he is unsympathetic, than even if he were unjust. The triumph of domestic rule is for the master's presence not to be felt as a restraint.'

The author proceeds to point out matters for the care of the employers, and after speaking of all due attention to the health of the men in the workshop and factory, the education of their children, and their recreations, he comes to the most important point of all—home. 'That the workman should have a home, which, however humble it may be, should yet afford room and scope for the decencies, if not for some of the comforts and refinements of civilised life, is manifestly essential, if we wish to preserve the great body of the people from a state of savageness. There is an important and original remark on this subject in the Hand-loom Weavers' Report of 1842:—

"The man who dines for 6d., and clothes himself during the year for L.5, is probably as healthily fed, and as healthily clad, as if his dinner cost two guineas a-day, and his dress L.200 a-year. But this is not the case with respect to habitation. Every increase of accommodation, from the corner of a cellar to a mansion, renders the dwelling more healthy, and, to a considerable extent, the size and goodness of the dwelling tends to render its inmates more civilised."

'Indeed, if civilisation does not show itself in a man's home, where else is it likely to take much root with him? Make his home comfortable, and you do more towards making him a steady and careful citizen than you could by any other means. Now, only look around and see how entirely this has been neglected, at least until within a recent date. Our workers are toiling all day long, or, if they have leisure, it is mostly accompanied by pecuniary distress; and can you expect in either case that they will busy themselves about those primary structural arrangements without which it is scarcely possible to have a comfortable home? Many of the things, too, which are needful for this end, require capital, or at least such conjoint enterprise as can hardly be expected from the poor. Take any individual workman. Suppose there is defective drainage in his street, or, as often happens, no drainage at all, what can one such man do, even if at all alive to the evil? When you consider the dependent condition of the labouring classes, and how little time they have for domestic arrangements of any kind, does it not behove the employer of labour to endeavour that his workmen should have opportunities of getting places to live in fit for human beings in a civilised country? I use the phrase "employer of labour" in its widest sense; and at once say, that there are many things bearing upon the comfort of the habitations of the poor, which both the local authorities and the imperial government ought to look to.

'There is at present in the metropolis,' continues our author, 'a society for "improving the dwellings of the industrious classes;" but what is one society? This is a matter which ought to interest the owners of property and the employers of labour throughout the country. Such a society as the one named may do great good by building model houses, making scientific investigations, and frequently laying before the public information on the subject. But the proper division of labour, as it seems to me, would be that the state should give every legislative facility for contemplated improvements in the way of building, should encourage all researches into the subject, and be ready to enforce by law such regulations as, without any great intrusion upon private property, might secure for small houses those primary requisites without which it cannot be expected that they will be anything but nests of disease. In fact, the state might eventually so order the matter, that builders should not merely build such houses as the poor would take—for there is nothing in the way of a shelter which they will refuse to occupy—but such as ought to be let to them, with due care at least for the public health. The local authorities should take upon themselves the lighting, cleansing, paving, supplying with water, and the like. For private individuals there remains the most important part of the task, namely, the building of an improved class of small houses. In this good work the employers of labour may be expected to come promi-

nently forward. Many a man will speculate in all kinds of remote undertakings; and it will never occur to him that one of the most admirable uses to which he might put his spare capital, would be to provide fit dwelling-places for the labouring population around him. In the present state of things, the rents of small houses are disproportionately high, because of the difficulty and uncertainty of collecting the rents for them; but by any improvement you introduce into the habits of the occupiers of such houses, you make this difficulty and uncertainty less, and thereby diminish rents. And thus in this case, as in many others, physical and moral improvement go on acting and reacting upon each other. It is likely, too, that these poor people will pay with readiness and punctuality even a higher rent, if it be for a really good tenement, than a small one for a place which they must inhabit in the midst of filth, discomfort, and disease, and therefore with carelessness and penury. Besides, the rents they pay now will be found, I believe, sufficient to reimburse the capitalist for any outlay which would suffice to build tenements of a superior description to the present ones.

'I do not mean to say that the beginners of such a system of employing capital might not have a great deal to contend with; and it is to their benevolence, and not to any money motives, that I would mainly appeal. The devout feeling which in former days raised august cathedrals throughout the land, might find an employment to the full as religious in building a humble row of cottages, if they tell of honour to the great Creator, in care for those whom he has bidden us to care for, and are thus silently dedicated, as it were, to His name.'

After pointing to many other matters, in which it behoves the master class to be stirring, the benevolent writer gives them a final admonition to keep in mind that simple rule long known as the golden. 'Oh,' he says, 'if we could but begin by believing and acting upon some of the veriest commonplaces! But it is with pain and grief that we come to understand our first copy-book sentences.' * * * 'We say that kings are God's viceregents upon earth; but almost every human being has, at one time or other of his life, a portion of the happiness of those around him in his power, which might make him tremble if he did but see it in all its fulness. But at any rate, the relation of master and man is a matter of manifest and large importance. It pervades all societies, and affects the growth and security of states in the most remarkable and pregnant manner; it requires the nicest care; gives exercise to the highest moral qualities; has a large part in civil life; a larger part in domestic life; and our conduct in it will surely be no mean portion of the account which we shall have to render in the life that is to come.'

We take leave of our author in a friendly and sympathising spirit; but yet feel it a duty to warn all such as he against taking one-sided views on this great question. Much as we are disposed in our own humble sphere to act upon his requirements, we cannot but feel that looking for a correction of existing and acknowledged evils solely to the kindly impulses of one class, and that one which is manifestly much engrossed in their own proper labours, can hardly end otherwise than unsatisfactorily. We must take human nature as it is, and we must mainly take social arrangements as they are too, and endeavour out of the principles there involved to work out some practical improvements. Public opinion, and advancing knowledge in all the parties concerned, will probably in a little time suggest and accomplish the necessary measures. Meanwhile, we would respectfully enter a caveat against both the urging of unjust charges against employers as a class, and the demanding from them of exertions and sacrifices beyond what they can fairly be expected to make. To assume that the whole employed class is to sit still, while the class of employers is to set about doing some great things for them, is manifestly calculated to do harm on all hands, instead of any good.

Beneficial changes are certainly on the way—the exposure of the evil makes this certain—but they must not be expected from too exclusive a source.

THE LOST GLOVES, OR WE SHALL SEE.

A STORY FOR LITTLE GIRLS.

On a fine afternoon in autumn, Mrs Merton was sitting in her library at Bayswater, with her bonnet and cloak on, and her parasol in her hand, apparently ready to take a walk. She was evidently waiting for some one, and not very patiently, for several times she looked at her watch, and then she rose and went to the window, and then sat down again. At last she rose, apparently quite tired out, and rang the bell, on which a servant appeared.

'Tell Miss Louisa, if she does not come directly, I shall go without her.' The servant vanished, and in five minutes Louisa came rushing down stairs.

'Oh, my dear mamma!' cried she, 'I am so sorry to have kept you waiting; but I could not find my gloves.' 'You never can find them when they are wanted,' said Mrs Merton; 'but surely you have more pairs than one?'

'Yes, mamma, I had; but you know I lost one of my silk gloves at the Chinese exhibition, and one of my kid gloves fell into the water when I was feeding the ducks in Kensington Gardens, and—'

'It is of little use telling me the history of all your lost gloves now; it is clear you have none to put on; and as you cannot go to town with me without gloves, we must buy another pair at the shop in Black Lion Lane.'

'But that will delay us so much.'

'It can't be helped; but I do hope, Louisa, that you will be more careful in future. After Christmas, I shall allow you two guineas a-year to find yourself in gloves and shoes, and whenever you have not any fit to go out, you shall stay at home.'

'Two guineas! Surely my gloves and shoes do not cost two guineas a-year?'

Mrs Merton smiled, and said, 'During the last year they have cost nearly double that sum.'

Louisa thought this impossible; but of course she did not say so; and by this time they had reached the shop. A pair of kid gloves was bought, which were so exactly what Louisa liked, that she could not help saying, as she put them on, 'You may depend upon it, mamma, I will take care of these gloves.'

'We shall see,' said Mrs Merton.

Now, if there was any one set of words that Louisa could not bear to hear her mamma utter, it was that phrase, 'we shall see.' Louisa loved her mamma dearly; very few little girls could love a mamma better; but when Mrs Merton said 'we shall see,' with that peculiar look and tone, Louisa felt so provoked, that she thought she did not love her mamma at all. Mrs Merton had indeed an incredulous way of speaking that was very provoking, particularly when Louisa, who was rather sanguine, thought the case so clear that it was impossible any one could doubt it: and there was nothing that Louisa felt to mortify her so much, as when a case of this kind had occurred, and circumstances had proved that the mamma was right, and the little girl was wrong. Louisa was very fond of making good resolutions, and she liked to be praised when she told her mamma that she had done so; but her mamma thought it was quite time enough to praise her when the resolutions were carried into effect; and then the dreadful phrase, 'we shall see,' came like cold water on all Louisa's glowing feelings, and chilled her more than I can express.

We left Louisa putting on her gloves, which fitted beautifully; and even after they left the shop, Louisa kept putting the fingers of one hand through those of the other, so as to push on the gloves the better; and as the leather was soft and flexible, it expanded so as to admit her fingers properly without a single tear, or even a crack; and Louisa, as she looked at her gloves again

and again, thought there was little danger of such gloves as those being lost for want of care.

When Louisa and her mamma reached the house of Mrs Merton's friend, they found they were too late, and that, after waiting for them for some time, she had been obliged to leave town without seeing them. Louisa was very much vexed at this, as she knew it would be of importance to her mamma, and her conscience told her she was in fault; and when they walked away from the door, she stammered a few words of apology for having kept her mamma so long while she was looking for her gloves. Mrs Merton, however, was evidently very much displeased. 'Say no more now, Louisa,' said she, 'but let what has happened to-day be a lesson to you another time.'

My readers may easily suppose, that after all this Louisa took the greatest care of her gloves when she reached home; and indeed for several days she always wrapped them up one within the other, and put them in the wardrobe before she took off her bonnet and cloak. Indeed I do think that the gloves would have been kept till they were quite worn out, if an unfortunate accident had not happened to them. One day some ladies called on Mrs Merton, and they were talking of worsted work, and Berlin patterns, and wool, and other things of that kind, when one of the ladies said she had heard of a manner of working in worsted on cloth that was practised abroad, but was not common in England.

'I am so anxious to see it,' said she, 'that I should think it almost worth taking a journey to Germany for that purpose alone.'

'I can gratify your curiosity, I believe,' said Mrs Merton, 'without your taking so much trouble. Go up stairs, Louisa, and fetch the cap your aunt worked in Poland.'

The cap in question was very beautifully worked in the manner the lady had described; and Louisa was very anxious it should be shown; but she remembered with dismay that she had borrowed it of her mamma to take the pattern of the work; and she remembered also that her mamma had been unwilling to lend it; and that Louisa had promised again and again to take the greatest care of it; and that her mamma had said 'we shall see,' and, worse than all, that she, Louisa, had not now the slightest recollection of what she had done with the cap, or where it was. All this rushed through her mind as she ran up stairs, and searched first in her own little sitting-room, then in the nursery, and then in the chiffonier in the drawing-room, as the ladies were luckily in the parlour; and a sort of dim recollection glanced across her mind that she had been in the drawing-room when she began to draw the pattern. A half-drawn pattern was indeed in the chiffonier, but no cap, and Louisa stood quite in despair, when suddenly the idea struck her that she had put it in the wardrobe in her bed-room, and she darted there like lightning. My readers may suppose the hurry and agitation with which she searched the wardrobe, which, I am sorry to say, was not in the very neatest order. A shawl or two tumbled out, but Louisa was too much absorbed to pick them up, when, oh joy of joys, she dragged out the much-wished-for cap! It is not possible to describe Louisa's delight. She never stopped to pick up the fallen shawls—she could not wait to shut the doors of the wardrobe, or even that of her bed-room, but flew down stairs, triumphantly holding the cap on her fingers; and she had the pleasure of hearing the ladies admire it even more than she expected. It was just what had been described, and Louisa's heart beat with joy and pride: she heard the ladies repeatedly say how glad they were to have seen it, and that they did not think there was another of the kind in England. Mrs Merton also seemed very much pleased, and after the ladies were gone, she told Louisa that she was very glad to find she had been mistaken; for, she added, 'I really was afraid that some accident had happened to it, when I found you stay so long before you returned.'

Louisa felt more proud and elated than she had ever done before as she skipped gaily up stairs; but, as she passed the door of her bed-room, which still stood wide open, she saw the shawls that had fallen out of the wardrobe lying upon the floor, and her little dog Fairstar lying upon them, apparently very busy eating something. At first Louisa thought it was a bone, and was frightened lest it should have tumbled the shawls; but oh how much worse was the truth! It was her gloves! Her darling gloves that Fairstar was eating! They had fallen from the wardrobe with the shawls, and Fairstar, which, like all other puppies, was very fond of gnawing everything that came in his way,

had found them, unwrapped them, and having gnawed off the end of one of the thumbs, was now very comely proceeding to the fingers. Louisa stood for some moments quite overwhelmed with the extent of this misfortune; but she was soon roused from her stupor by her mamma's voice telling her to put on her things to go out. This was the climax. She darted forward, and giving poor Fairstar a violent blow, snatched up the gloves. But, alas! the mischief was already done, and both gloves had been so gnawed and wet, that it was impossible to put them on. Luckily, some fresh visitors came to see Mrs Merton, and they stayed till it was too late to go out, so Louisa escaped for that day; but the next, she knew her mamma was sure to go out, and she racked her brain to think what she could do, as she was quite ashamed to tell her mamma what had happened. It was but little more than a week since the gloves had been bought, and this was the result of the care she had promised; and then she looked at the gloves again, and tried to smooth them out; but it would not do; the thumb of one was quite gone, and Louisa, when she looked at them, absolutely cried with vexation. When she went to bed, it was a long time before she could sleep; and in the morning when she woke, she felt as if some dreadful misfortune had happened, before she could recollect what it was. All day long poor Louisa was thinking about the gloves, and never had she said her lessons so badly, or made so many mistakes in what she was desired to do. Never had any morning appeared so long, and yet she dreaded luncheon time coming, as she knew her mamma would probably go out as soon as it was over. This time, however, did come, and the words, 'Go up stairs, Louisa, and put your bonnet on,' had been said: no delay was therefore to be thought of, and though Louisa crawled up stairs as slowly as possible, she dared not be long in putting on her things; but how could she tell her mamma about the gloves? How she wished she had but courage to run down stairs and tell her mamma at once; but false shame kept her back. She thought of her mamma's dreadful 'we shall see;' and she felt she really could not bear to own just then how much in the right she found her mamma had been. Again she looked at the gloves, but they were even worse now than they had been the night before, for they had become hard and dry since they had been crumpled up. Then she thought of keeping her hands under her cloak, and she was just taking out her cloak to try how she could manage it, when her muff fell to the ground. Louisa caught it up with great delight—'This is the very thing,' thought she; 'mamma likes me to walk with both my hands in my muff, and as the day is cold, I can wear it quite well; besides, as we are going along, perhaps something will occur, so that I may be able to tell her about the gloves more easily than I could do now.'

And so Louisa, feeling quite rejoiced to have put off the evil day, tripped down stairs with both hands hidden in her muff. It happened that a lady was with Mrs Merton when Louisa came down stairs, and I am afraid that the little girl was glad when she found that this lady was going to walk out with them, as it would put off still longer the explanation about the gloves; for, though Louisa heartily wished it over, she dreaded the beginning so much that she was very glad to have a further respite. When Louisa reached the parlour, Mrs Merton was talking too earnestly to her friend Miss Hutchins to notice her daughter's muff; but the little girl was horror-struck when her mamma rose and said, 'Open the door, Louisa;' for how could she open the door, and yet keep both hands concealed? Luckily, however, the door was a little ajar, and Louisa contrived to push it open with her foot; but her heart beat violently at the narrow escape she had had, and she trembled lest her mamma should tell her to open the hall door, or to unlock the gate, if the servant, whose duty it was to perform these offices, should happen not to be ready in time; and it is impossible to describe the relief Louisa felt when she found herself safely in the open road. It was fortunate that Mrs Merton had a companion, for Louisa could think of nothing but her gloves, and yet of those she felt every moment more and more reluctant to speak. As they passed the end of Black Lion Lane, she could not help shuddering when she thought of the shop where the gloves were bought, and her exultation at the thought of keeping them carefully only five short days before; and where were they now? As they entered the door leading into Kensington Gardens, Mrs Merton saw a beautiful little bit of granite lying on the road, and pointed it out to her daughter, as she knew Louisa was making a little motto for her cousin's birthday

with all the pretty bits of stone she could find. The granite sparkled beautifully in the sun, and it was just the size and shape that Louisa wanted; but as it could not be picked up without taking her hands out of her muff, poor Louisa was obliged only to shake her head and pass it by. They now entered the gardens, and while they were walking under the trees, Louisa saw on the grass a beautiful caterpillar of the sphinx moth. Now, it had been Louisa's ardent desire for several months to meet with one of these creatures. She had seen one in Devonshire the summer before, and, on her return, had described it to her cousin Harriet, when Charlotte, one of Harriet's friends, who was present, and who was a most disagreeable girl, had laughed scornfully, and said she did not believe a word of it, adding, with a sneer, that travellers told strange tales. Now, there was nothing in the world that was so painful to Louisa as to have it supposed that she did not tell the truth, as she had a horror of falsehood, and had never told one in her whole life. She was therefore most anxious to find a sphinx caterpillar to show her cousin that she had not even exaggerated its description; and there one lay as beautiful as possible, with its bands of shaded green and lilac on a cream-coloured ground, and its curious horn even longer than the one Louisa saw in the country; and yet there she was obliged to let it lie, for how could she pick it up, and, above all, carry it home uninjured, without taking her hands out of her muff: the thing was impossible, and so Louisa walked on with tears in her eyes, and looking back every moment, till her mamma, looking at her attentively, asked why she was lingering, and Louisa's guilty conscience made her hurry on. They had now reached the pond, and the ducks crowded round Louisa, some of the most impudent pulling her cloak, as though they were asking her to give them something. Mrs Merton felt in her reticule, and finding a bit of bun, held it out to Louisa, that she might have the pleasure of feeding her old favourites. Louisa's heart beat—the moment for discovery was now surely come—for how could she avoid taking the bun; when, luckily, the large swan stretched out his long neck, and snatched the piece out of Mrs Merton's hand. Mrs Merton laughed, and telling Louisa that she must be quicker another time, turned away.

They now quitted the gardens, and went to call on a lady who lived at Kensington. Here some cakes were produced, and Louisa pressed to take one, which she would have been very glad to do if she could have contrived any means of getting it into her mouth without using her hands; but as there was not, she was obliged to decline. The lady of the house was very partial to Louisa; and seeing her sit so silent, with both her hands in her muff, and seeming so very uncomfortable, she very kindly proposed to Mrs Merton to let her little girl take a run round the garden behind the house. Louisa, terrified at this, for she felt she could not run without her hands being at liberty, hastily declined; and Mrs Merton, fearing that her poor little girl was ill, rose to return home. Another terror seized Louisa when she found that Miss Hutchins might possibly remain behind, as then she knew her mamma would be sure to take her hand; but Miss Hutchins came back with them almost as far as their own home; and thus they passed through Kensington Gardens without the dreaded discovery being made. A new fear, however, had taken possession of Louisa's mind, which haunted her through the gardens; and this was, that when they reached their own gate, how could she avoid ringing the bell, which she had always been used to do, to save her mamma the trouble: but even this danger was escaped, for the gate happened to stand open. They were now at home; and Louisa had thought several times during her painful walk, that if she could but reach home without discovery, she would be quite happy. And was she happy? Alas, no! she was more miserable than ever; and she felt more unable than ever to confess the truth. They were now ascending the stone steps leading to the hall door, when Mrs Merton, who had been looking behind her, trod on a bit of apple-paring, and, her foot slipping, she would have fallen, had not Louisa extended her hand. In the agitation of the moment the gloves were quite forgotten, and the muff fell to the ground. Mrs Merton's eyes met those of Louisa, and then glanced at her ungloved hands. The whole truth was now revealed; and in a very few minutes Mrs Merton was sitting in the parlour, and Louisa kneeling and hiding her face in her mother's lap. 'Oh, mamma,' cried the weeping girl, 'I will never, never do anything that I must conceal from you again. If you

knew what I have suffered during this dreadful morning. Every time you looked at me I trembled all over, and felt as cold as death; and when I tried to speak, I was almost choked. I wonder that people do not die with fright when they have done anything wrong, and are taken up by a policeman. What a dreadful thing it is to have a secret! What I have suffered to-day will be a lesson to me as long as I live. I do not mean about the gloves, though I will try to take as much care as I can of the next pair you are so kind as to give me; but I mean I will never be so confident again, and that I will never again boast so conceitedly of what I will do. And, more than all, if I should do wrong, that I will have the courage to come and tell you at once, and to submit to any punishment you may think proper; for I am sure no punishment you would inflict upon me could ever make me feel one-tenth part of the pain I have endured this morning.'

STATE OF SCOTLAND A CENTURY AGO.

THE following letter, descriptive of the condition of our country a century ago, was written by Mr John Maxwell of Munches, to Mr Herries of Spottes, both in the stewardry of Kirkcudbright, in the year 1811, when the venerable writer was above ninety. It has been several times printed, but nevertheless is sufficiently curious to merit the extended circulation which the Journal can give it.

'I was born at Buittle, in this parish, which in old times was the fortress and residence of John Baliol, on the 7th day of February, old style, 1720, and do distinctly remember several circumstances that happened in the years 1723 and 1724. Of these particulars, the falling of the bridge of Buittle, which was built by John Frew in 1722, and fell in the succeeding summer, while I was in Buittle garden, seeing my father's servants gathering nettles. That same year many of the proprietors enclosed their grounds to stock them with black cattle; and by that means turned out a vast number of tenants at the term of Whitsunday 1723, whereby numbers of them became destitute, and, in consequence, rose in a mob, when, with pitchforks, gavellocks, and spades, they levelled the park-dikes of Barncaillie and Munches at Dalbeaty, which I saw with my own eyes. The mob passed by Dalbeaty and Buittle, and did the same on the estates of Netherlaw, Dunrod, &c. and the laird of Murdoch, then proprietor of Kilwhaneday, who turned out sixteen families at that term. The proprietors rose with their servants and dependants to quell this mob, but were not of sufficient force to do it, and were obliged to send for two troops of Dragoons from Edinburgh, who, upon their appearing, the mob dispersed. After that, warrants were granted for apprehending many of the tenants and persons concerned in the said mob; several of them were tried, those who had any funds were fined, some were banished to the plantations, whilst others were imprisoned; and it brought great distress on this part of the country. At that period justice was not very properly administered; for a respectable man of the name of McClacherty, who lived in Balmaghie parish, was concerned in the mob, and, on his being brought to trial, one of the justices admired a handsome Galloway which he rode, and the justice told him if he would give him the Galloway he would effect his acquittal, which he accordingly did. This misfortune, with what happened the Mississippi Company in the year 1720, did most generally distress this quarter of the kingdom. It is not pleasant to represent the wretched state of individuals as times then went in Scotland. The tenants in general lived very meanly, on kail, groats, milk, graddon ground in querna, turned by the hand, and the grain dried in a pot, together with a crock ewe now and then about Martinmas. They were clothed very plainly, and their habitations were most uncomfortable. Their general wear was of cloth, made of unworkt plaiding, black and white wool mixed, very coarse, and the cloth rarely dyed. Their hose were made of white plaiding cloth sewed together, with single-soled shoes, and a black or blue bonnet, none having hats but the lairds, who thought themselves very well dressed for going to church on Sunday with a black kilt-coat of their wives' making. It is not proper for me here to narrate the distresses and poverty that were felt in the country during these times, which continued till about the year 1735. In 1725 potatoes were first introduced into this stewardry by William Hyland, from Ireland, who carried them on horses' backs to Edinburgh, where he sold them by pounds and ounces. During these times, when potatoes were not generally raised in the country, there

was for the most part a great scarcity of food, bordering on famine; for in the stewardry of Kirkcudbright and county of Dumfries there was not as much victual produced as was necessary for supplying the inhabitants; and the chief part of what was required for that purpose was brought from the Sandbeds of Esk in tumbling cars, on the Wednesdays, to Dumfries; and when the waters were high by reason of spates, and there being no bridges, so that these cars could not come with the meal, I have seen the tradesmen's wives in the streets of Dumfries crying because there was none to be got. At that period there was only one baker in Dumfries, and he made bawbee baps of coarse flour, chiefly bran, which he occasionally carried in creels to the fairs of Urr and Kirkpatrick. The produce of the country in general was gray corn; and you might have travelled from Dumfries to Kirkcudbright, which is twenty-seven miles, without seeing any other grain except in a gentleman's croft, which, in general, produced bere or big for one-third part, another third in white oats, and the remaining third in gray oats. At that period there was no wheat raised in the country; what was used was brought from Tenviot; and it was believed that the soil would not produce wheat. In the year 1735 there was no mill in the country for grinding that sort of grain; and the first flour-mill that was constructed within these bounds was built by old Heron, at Clouden, in the parish of Irongray, some years after that date.

In these times cattle were also very low. I remember being present at the Bridge-end of Dumfries in 1736, when Anthony McKie, of Netherlaw, sold five score of five-year-old Galloway cattle, in good condition, to an Englishman, at L.2. 12s. 6d. each; and old Robert Halliday, who was tenant of a great part of the Preston estate, told me that he reckoned he could graze his cattle on his farms for 2s. 6d. a-head; that is to say, that his rent corresponded to that sum.

At this period few of the proprietors gave themselves any concern anent the articles of husbandry, their chief one being about black cattle. William Craik, Esq. of Arbigland's father died in 1735, and his son was a man of uncommon accomplishments, who, in his younger days, employed his time in grazing of cattle, and studying the shapes of the best kinds, his father having given him the farm of Maxwelltown to live upon. The estate of Arbigland was then in its natural state, very much covered with whins and broom, and yielding little rent, being only about 3000 merks a-year.* That young gentleman was among the first that undertook to improve the soil; and the practice of husbandry which he pursued, together with the care and trouble he took in ameliorating his farm, was very great. Some of it he brought to such perfection, by clearing off all weeds and stones, and pulverised it so completely, that I, on walking over the surface, sunk as if I had trodden on new-fallen snow.

The estate of Arbigland was bought by his grandfather, in 1722, from the Earl of Southesk, for 22,000 merks.

In 1735 there were only two carts for hire in the town of Dumfries, and one belonging to a private gentleman.

About the years 1737 and 1738 there was almost no lime used for building in Dumfries, except a little shell-lime, made of cockle-shells, burned at Colvend, and brought to Dumfries in bags, a distance of twenty miles; and in 1740, when Provost Bell built his house, the under storey was built with clay, and the upper storeys with lime, brought from Whitehaven in dry-ware casks. There was then no lime used for improving the land. In 1749 I had day-labourers at 6d. per day, and the best masons 1s. This was at the building of Mollance House, the walls of which cost L.49 sterling.

DOMESTIC RELATIONS IN ITALY.

The duties of husband and wife are in England observed with even more sanctity than they obtain credit for. But in how many instances do our affections and duties begin and end there, with the exception of those exercised by the parents towards their very young children. We all know that when a son or daughter marries, they literally fulfil the dictum of Adam, 'therefore shall a man leave his father and mother, and cleave unto his wife.' Our family affections centre in the small focus of the married pair, and few and ineffectual are the radii that escape and go beyond. Now, it must be acknowledged that, however endearing at

* Eighteen merks make L.1 sterling, or L.12 Scots.

the outset, however necessary and proper to a certain extent such a state of things may be, it often degenerates after a little time into the most sordid selfishness. The Italians are deficient in this self-dedication to one; but they have wider extended family attachment, of a very warm and faithful description. We consider it a necessity of life to have a *ménage* to ourselves; each couple in its nest cannot understand the harmony and affection nourished in a little republic, often consisting of grandfather and grandmother, who may be said to have abdicated power, and live in revered retirement—their days not counted and grudged, as with us is too frequently the case; then come father and mother respected and loved, and then brothers and sisters. If a sister marries, she becomes a part of another family, and goes away. The son brings his wife under his father's roof; but the size of their houses renders them independent in their daily life. The younger sons are not apt to marry, because, in addition to their want of fortune, too many women, essentially strangers, would thus be brought under one roof, and would be the occasion of discord. We know how readily the human heart yields to a law which it looks on as irrefragable: submitting to single life, uncles learn to love their nephews and nieces, as if they were their own offspring, and a strong family chain is thus formed. A question may arise as to how much of family tyranny turns these links into heavy fetters. In the first place, their families are seldom as numerous as with us. The necessities of their position fall lightly on the males. All over the world, younger sons seldom marry, or only do so to exchange luxury for straitened circumstances; and younger sons who continue to grow old under the paternal roof, sharing by right the luxuries to which they were born, and in which they were educated, are better off than our younger sons, who are often thrust forth from the luxurious home of their youth, to live on a bare pittance in a wretched lodging. Unmarried women all over the continent have so much the worst of it, that few remain single. How they contrive to dispose of their girls, now convents are in disuse, I cannot tell; but, as I have said, there are not so many as with us, and they usually contrive to marry. At times you may find a maiden aunt, given up to devotion, who sheds a gentle and kindly influence over the house. It does not strike me that, as regards daughters who survive their parents, things are better managed with us. This family affection nurtures many virtues, and renders the manners more malleable, more courteous and deferential. For the rest, though I cannot pretend to be behind the scenes—and though, as I have said, their morality is confessedly not ours—I am sure there is much both to respect as well as love among the Italians.—*Mrs Shelley's Rambles.*

A MONEY-MAKER.

About twelve years ago, a poor Frenchwoman, residing at Buenos Ayres, being exceedingly perplexed with regard to the 'ways and means,' set her inventive genius to work, and hit upon the following expedient:—Observing a vast quantity of bones and animal offal thrown away from the slaughter-houses with which Buenos Ayres abounds, a thought struck her that she might turn this waste to a profitable account. Having procured a large iron pot, and collected a quantity of bones, &c. she commenced operations by boiling them, and skimming off the fat, which she sold at the stores in Buenos Ayres. Finding the proceeds of her industry amply reward her labour, she persevered, advancing from a pot to a boiler, and from a boiler to a steaming-vat, until she possessed a magnificent apparatus capable of reducing a hundred head of cattle to tallow at one steaming. Four years ago she sold her manufactory, retired from business, and now rolls through the streets in one of the handsomest carriages in Buenos Ayres. There is now scarcely a respectable merchant in that place, or in Monte Video, but is in some way connected with cattle-steaming.—*Cape Frontier Times.*

ELEGANT HABITS OF BEES.

Did any one ever sufficiently admire—did he, indeed, ever notice—the *entire elegance* of the habits and pursuits of bees? their extraction of nothing but the quintessence of the flowers; their preference of those that have the finest and least adulterated odour; their avoidance of everything squalid (so unlike flies); their eager ejection or exclusion of it from the hive, as in the instance of carcasses of intruders, which, if they cannot drag away, they cover up and entomb; their love of clean, quiet, and delicate neighbourhoods—thymy places with brooks; their singularly clean

management of so liquid and adhesive a thing as honey, from which they issue forth to their work as if they had nothing to do with it; their combination with honey-making of the elegant manufacture of wax, of which they make their apartments, and which is used by mankind for none but patriotic or other choice purposes; their orderly policy; their delight in sunshine; their attention to one another; their apparent indifference to anything purely regarding themselves, apart from the common good. * * In the morning, the bee is honey; in the evening, the waxen taper; in the summer noon, a voice in the garden, or in the window; in the winter, and at all other times, a meeter of us in books. She talks Greek to us in Sophocles and Theocritus; Virgil's very best Latin in his *Georgics*; we have just heard her in Italian; and besides all her charming associations with the poets in general, one of the Elizabethan men has made a whole play out of her, a play in which the whole *dramatis persona* are bees!—*Ainsworth's Magazine.*

BONNY BONALY.

Bonny Bonaly's wee fairy-led stream
Murmurs and sobs, like a child in a dream,
Falling where silver light gleams on its breast,
Gliding through nooks where the dark shadows rest,
Flooding with music its own tiny valley—
Dances in gladness the stream of Bonaly.

Proudly Bonaly's gray-browed castle towers,
Bounded by mountains, and bedded in flowers;
Here bends the blue-bell, and there springs the broom,
Nurtured by Art, choicest garden flowers bloom;
Heather and whin scent the breezes that daily,
To play 'mid the green knolls of bonny Bonaly.

Pentland's high hills raise their heather-crowned crest,
Peerless Edna expands her white breast;
Beauty and grandeur are blent in the scene,
Bonny Bonaly lies smiling between;
Nature and Art hand-in-hand wander gaily—
Friendship and Love dwell in bonny Bonaly.

—From '*The Gaborhalsd's Wallet*,' by James Ballantyne.

MANGOLD-WURZEL.

A French newspaper tells the following story of the introduction of this root into cultivation in Flanders:—When Napoleon was endeavouring to protect himself against the inconveniences felt from the impossibility of obtaining colonial produce, in consequence of the activity of the English cruisers, an order was given that measures should be taken to induce the Flemings to grow beet, for sugar-making. The prefect of the department of Jemappes, accordingly, invited all the farmers of his district to set about the cultivation of the root, and distributed seed among them. The Flemish farmers hit upon its management immediately, and the first season gave them a large crop. But when the roots were ready, nobody knew what to do with them; so the farmers resolved to cart them to the prefecture. And accordingly, one fine morning, the prefect was surprised by the arrival of heavy carts, bringing him some hundred thousand kilogrammes of beet. Having no means of taking it in—for the buildings in which it was to be manufactured had not been thought of—he had no resource but to pay for the crop, and get the country people to cart it away again. This led them to consider whether cattle could not be fed upon it; and the result we all know.

GENTLENESS.

Gentleness which belongs to virtue, is to be carefully distinguished from the mean spirit of cowards and the fawning assent of sycophants. It removes no just right from fear; it gives up no important truth from flattery; it is, indeed, not only consistent with a firm mind, but it necessarily requires a manly spirit and a fixed principle in order to give it any real value.—*Blair.*

* * Complete sets of the Journal, First Series, in twelve volumes, and also odd numbers to complete sets, may be had from the publishers or their agents. A Stamped Edition issued for transmission, post free, price Two-pence halfpenny.

Printed by William Banchory, of No. 6, York Place, and Frederick Mollat Evans, of No. 7, Church Row, both of Stoke Newington, in the county of Middlesex, printers, at their old London Street, in the precinct of Whitefriars, and city of London; and Published (with permission of the Proprietors, W. and R. CHAMBERS,) by WILLIAM SOMERVILLE ORR, Publisher, at 2, Amen Corner, at No. 2, AMEN CORNER, both in the parish of Christchurch, and in the city of London.—Saturday, January 11, 1845.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 55. NEW SERIES.

SATURDAY, JANUARY 18, 1845.

PRICE 1½d.

THE NEWSPAPER PRESS IN AMERICA.

In no other country in the world, perhaps, is the newspaper press so powerful an engine as in the United States. Nowhere else is it so omnipresent in its action, so omnipotent in its influence. It addresses itself not to a class or a section of the people, but universally to the nation. In the social structure of America, there is no great class devoid of the first elements of education. In the northern states especially, the ability to read and write is universal. In a state of society which converts every man into an active politician, the species of information most in demand, and most greedily devoured, may be readily surmised. The constant yearning for political intelligence is incredible to any but an eye-witness. The newspaper offices may be said to be, to the Americans generally, what the gin-palaces are to a section of the London population—the grand source whence they derive the pabulum of excitement. Such being the case, it is no wonder that journals should multiply amongst them. Almost every shade of opinion, political, social, or religious, has now its representative organ or organs. The press in America speaks to every one, and of every one. Its voice is heard in every cabin in the land; its representatives are found thickly scattered over every settlement; it is a power irresistible, and which must be conciliated; making itself felt in every public department, and at the same time exercising a tremendous influence over private life.

In England, the daily papers are confined to the metropolis. In America, the daily press may be said to be the rule, the semi-weekly and weekly the exception. The newspaper is an essential feature in almost every American village. Towns, such as in England would have no newspaper of their own, have in America their daily journals. It is seldom that a population as low as two thousand is to be found without them, battling for the great factions which agitate every corner of the country. They take a pride in having their local organs, and enterprise soon avails itself of this feeling. The reader may better judge of their multiplicity from a single instance. I select a town which stands on the borders of Lake Ontario, and which contains about 20,000 inhabitants. In that town there are at this moment three daily papers; two of them appearing in the morning, the other being an evening paper. They are all independent of each other, and none of them neutral. The evening paper takes a strong party stand with one of its morning contemporaries; and although these represent the opinions of the minority both in the town and county, there is yet sufficient room for them both: they are, indeed, all flourishing. Besides these, a weekly paper is issued from their respective establishments, which is widely circulated in the county amongst those who cannot afford the luxury of one daily; but

with each of them, the number of daily impressions despatched into the surrounding townships is fully equal to that of the weekly editions. They are all to be met with in the bar-rooms of taverns, and in private houses, according to the political bias of the inmates; and there are few houses, amongst the farmers especially, which are not thus provided. The inhabitants of this town have also a weekly medical paper, a weekly paper exclusively agricultural, another exclusively literary, and another of a satirical character. All these have existed for years, and keep their ground well. Superadded to these, hundreds of daily papers, issued from Albany or New York, arrive by post for subscribers resident in the town—the latter being taken principally for the more authentic information, and the better comments they contain upon matters of general policy, which their readers are thus in possession of before the local papers can copy them.

The universal interest taken in politics is not the only means of accounting for the astonishing variety and number of American newspapers. The cheap rate at which they can be obtained, and the extensively available channel which they open for advertising, contribute materially to the increase of their number. A daily paper of the first class can be procured for eight dollars annually—less than two pounds sterling. Many are furnished for six dollars; and some respectable daily prints are published in New York as low as three. A daily English paper costs more than three times the price of the highest of these, or from six to seven pounds. Some are sold in the streets of New York at the rate of a cent a number—that is, a fraction more than an English halfpenny. The character of the American papers, their general tone and literary ability, in comparison with those of England, are not at present under consideration. With all the trashy and pernicious stuff which the majority of them diffuse throughout the community, they circulate a vast mass of useful and solid information, creating a degree of intellectual activity which cannot but be beneficial to a people.

As an advertising medium, the public journals of America are used to an extent unparalleled in this country. With a white population amounting to little more than half that of Great Britain, and with a commerce scarcely equalling in extent one-third of that of this country, the number of advertisements published in America within the last seven years, as compared with the number published during the same period in this country, was in greater proportion than six to one. This difference is created by the absence of all advertisement duties, by the general cheapness in the rate of advertising, and by the extensive circulation of the different papers—a circulation, as already shown, large, from the enormous political appetite of the public, but greatly increased by the universality of the practice

of advertising. In general, even the remotest inland papers lay out three-fourths of their space for advertisements. The rate of insertion is exceedingly moderate, and their profits arise from the species of wholesale advertising business which they carry on. Many papers adopt the system of letting as much of their space as will let for a specified time, the lessee selecting his own part of the paper as he would his pew in a church, or his family burying-ground in a cemetery, and paying for it by its square measurement. To secure permanent customers of this sort, the rate is lowered to a kind of wholesale price; and sometimes a year's advertising, not exceeding from thirty to forty lines each day, can be thus procured as low as seventeen dollars. During the period to which a bargain of this kind extends, the control of the advertiser over the spot selected by him is in a manner absolute, and his announcements are to be found in all shapes and positions—upside down, in the form of a pyramid or cross, diagonal, vertical, or Chinese fashion. Almost every one advertises, for every one is busy. In the northern states there are no idlers; every man has his vocation; and from the lawyer to the chimney-sweep, their services are offered to the public through the medium of the newspaper. Indeed it is common for the former functionaries, especially in the interior, to have standing cards in their local papers, informing the public both of their place and hours of business. Its advertising columns are frequently the most amusing, though sometimes a very disgusting part of a paper: every trick is resorted to to arrest attention; each page is illuminated with hats, houses, boots, umbrellas, barrels, cattle of all descriptions, every item of male attire, locomotives, steamboats, canal boats, 'fast-sailing schooners,' and a multitude of other objects which enter into the multifarious business of mankind; and the smile which this occasions is often prolonged by the mode of announcement in the letter-press. Announcements such as follow are selected from a thousand others equally absurd and bombastic:—'North, south, east, and west, your interests are in danger; and when one eagerly reads on to learn the source of alarm, he finds it to consist perhaps of the additional cent per yard which all but the advertiser charge on some flaunting calico pattern. 'Shopping a luxury,' 'money no object,' 'competition floored,' 'stern defiance,' 'to arms, to arms, to arms! the body politic in danger from—Jack Frost,' &c.; and these are sometimes surmounted by grotesque designs, in some of which the advertiser is seen engaged in a race of speed with his neighbours and competitors, and outstripping them all. A shrewd observer of human nature was the Alabama sheriff, who headed an advertisement of a land sale with—'Don't read this.'

If there be one thing more than another which marks an American newspaper, it is the violence of its political disquisitions. On the subject of politics, a transatlantic journal is unacquainted with moderation; and of the thousands published daily and weekly, there are few that begin by being, and fewer still that continue to be, neutral. Into the political vortex they are all drawn, there to be tossed to and fro, in a delirious round; on one side or another, in the strife of party, they are all ranged. On the eve of an election, their political complexion is discerned at a glance by the 'ticket' which heads their editorial columns, the 'ticket' consisting of the names, in large type, of the candidates whose election they advocate. This is done in their election both for state and for federal offices. The 'ticket' is called

Henry Clay, of Mr Polk, or of Martin Van Buren, as the case may be. As soon as a nomination, by the different parties, of candidates takes place, all the papers are committed; and some are bold enough, even before a nomination, to hoist at once its own favourite flag, although, as soon as the nomination takes place—such is their devotion to party—these are invariably hauled down to make way for the 'ticket' of the fortunate nominee. The asperity with which they conduct the political battle under their respective ensigns is a great blemish on their character. They take and they give no quarter. On the approach of an election, a stranger would anticipate, from perusing their columns, that every polling-place in the country must inevitably become the scene of a diabolical carnage; and yet, in the main, the business of polling in America is a very peaceable affair. In 1840, upwards of two millions of votes were recorded for the contending claimants to the presidency, and yet not a drop of blood was spilt throughout the length and breadth of the land. The wrath of the people effervesces in their party organs; and that bitterness and vituperation which are the creations of their printing-presses, seldom lead to any desperate personal collision. The worst feature of the journals is, unquestionably, their gross and disgusting personality. To serve a party purpose, they invade, without scruple, the sanctity of private life. Daily, in some quarter or other, is one of their prominent senators reminded of some trifling peccadillo, of which he is alleged to have been guilty at school, when about eleven years old; and Ex-Governor Marcy of New York will be reminded by the Whig press to his dying day that he charged the treasury two shillings and ninepence for mending his breeches, which were accidentally damaged during an official tour through the state. The party names and epithets which they bestow upon each other are amusing, though sometimes degrading enough; 'Loco Focos,' 'Blue Lights,' and 'Hoco Pocos,' being sufficient as samples of their political Billingsgate. They have no idea of receiving an electioneering triumph with quiet satisfaction. The exultation of the successful party is unbounded; and they like to try the temper of their crest-fallen opponents, by making it as ostentatious as possible. They celebrate their victory by illuminating their houses, while their organs illuminate their pages. Sometimes a cock is perched at the head of the editorial columns, and being in the attitude of crowing, there can be no mistake of the object for which he is thus placed. In 1838 and 1840, when the Whigs triumphed in New York, a leading journal in Albany, the capital of the state, devoted one whole side to an enormous eagle, which was represented with outstretched wings flying over the country with the 'glorious intelligence.'

The same rivalry in seeking to obtain early or exclusive news which distinguishes the London press, is also a marked feature in the conduct of American journals. To be the first to furnish the public with a president's message—with some great speech in Congress, which has been eagerly looked forward to—with any minor or secret intelligence concerning the cabinet and its doings—with the fate of any important measure in the legislature—or with European intelligence, is, particularly with the New York and Philadelphia papers, sufficient to induce them to incur a lavish expenditure. In some instances a whole edition of a New York paper has been printed in Washington, on the opening of the legislative session, so that the train from the capital,

from which they might publish for themselves, has brought their more alert contemporary in full sheet, which realised an enormous sale in the streets before its rivals could make their appearance. Many of the New York papers have their regular couriers in Boston, who start with the European files the moment the packet arrives, arranging the news for their different offices on the road; and some of them, as soon as a vessel from Europe is telegraphed in 'the Narrows,' hire a steamboat with which to meet her, so that the news which she bears is hawked about the streets long before she reaches the Battery.

In a literary point of view, nine-tenths of the American journals are at Zero in the scale of respectability. Their editors are more frequently rather men of bustling enterprise than of talent and education. In the main, the business of editing in America is destructive of everything like delicacy or refinement. What is required is tantamount to a pair of good fists in physical scuffling—to give good blows, and have a hard head to receive them in return. In many cases the editors are, simultaneously with the conduct of the paper, engaged in other pursuits—mechanical, mercantile, or professional—a part of their time only being devoted to their editorial duties. When it is recollected that this is the case even in the management of a daily paper, its slovenly appearance and inferior general character are in part accounted for. There is seldom the requisite degree of unity in their management to make even a tolerable paper. When there are several proprietors, it is not unfrequent to find them—although they have a nominal editor—all acting as editors, and sending paragraphs to the compositor without the slightest consultation with the responsible party. This gives rise of course to many serious incongruities, and involves them in many awkward inconsistencies. The editor is seldom called upon to write; his position is more that of a receiver of paragraphs than a writer. He draws far more frequently upon the editor's box than upon his own brain; he seldom ventures on what may be called a leading article, trusting for general political intelligence to his more ably conducted metropolitan contemporaries. Instead of this, the original matter of these papers often consists of a host of letters from young and ambitious politicians, each of whom, aspiring to the presidency, is anxious to make himself known to fame as speedily as possible. These effusions are all characterised by what seem essential ingredients in American polemics—gross abuse, and scrimonious invective. They are eagerly read, especially when the object or party attacked is of a local character or standing. The columns of the journals are likewise freely open to the essayist, from whose prolific pen they often insert long dull and vapid nothings. A poet's corner is an almost invariable appendage; and, judging from its constant occupation, the muse is most extensively, if not very successfully, cultivated in America. The vast majority of poetic contributors are sentimental young ladies. Is there a child born into the world?—its parents are sure to have some poetic friend, in the shape of a young lady, who indites an ode to its advent; is it baptised?—another ode, commemorative of the event, is inflicted upon the public. Is there a marriage?—some one is sure to torture into being a hymenal hymn for the occasion. Is there a death?—it is no easy matter for an editor to select from the bundle of elegies he receives. Is there a shipwreck or any great national event?—and the poor beworried *nine* are called upon to inspire a thousand pens, and to direct a thousand very errant fancies. When a young lady marries, however poetically inclined she may have been before, she rapidly subsides into the prosaic mass, finding, when she has babies of her own, that she has more urgent duties to attend to than to write poems about them. The newspaper literature of America is of enormous bulk, but of no elevation. It is one great dead sea of stagnant water, with no flashing wave to break its dull surface—no phosphorescence to illuminate its depths.

The editor of an American newspaper, writing but

little, is in almost every other sense a working-man. In general, the control of every department in the establishment is vested in him alone: he keeps the books, receives and pays out money, takes the advertisements, and, on an emergency, can sometimes turn compositor. When he enters with zeal into his task, his labours are of the most multifarious description. He must attend all political meetings of his own party, and must be found in the van of practical out-door politicians. He is always expected to be an orator, and is generally an oracle. At party meetings he must pander well to the peculiar tastes of his hearers; and, consequently, he who on such occasions surpasses all others in the measure of his language and the fury of his gestures, is in most cases—the editor. His field extends also to the committee-room and the secret 'Caucus.' He is always installed in the most laborious post, and generally fulfils his duty to the satisfaction of his constituents. In England, the paper is everything, the editor nothing. In America, the editor is invariably identified with his paper. It is he who is the recipient of contemporary abuse; it is on his shoulders that fall all the odium and acrimony of the opposite faction. This is universally so. In New York, in Albany, in Boston, and in other leading towns, the editors are all known, and assailed respectively by one another. In the interior, this system is of course carried to a greater and more revolting extent than in the capitals. From each paper might be culled the complete biography of the editor of its opponent. The moment a new editor makes his appearance in any place, the opposition paper opens upon him; and everything to which malicious ingenuity can impart an equivocal character is evoked from the past, and presented as a series of delicious morsels to the palate of faction. In self-defence the outraged stranger must retort, and a host of recriminations ensue, to the great gratification of all who are out of the ring, and, if possible, more scurrilous in their character than were the bulls and invectives which for seventy years, during the great western schism, were fulminated between Avignon and Rome. To the leading party-journals much is frequently owing in the issue of an election. But even then it is the editor who is lauded and rewarded. The party is not satisfied with the expression of a vague gratitude to an establishment; it seizes upon the editor as a more tangible object, and on him lavishes its praises, and sometimes proves its appreciation of his services by presenting him, as was done to the editor of the Albany Evening Journal in 1840, with—a cloak. Known as they are, it is seldom, as is the case in France, that they are raised to any political eminence. They are hard-working party hacks; their influence in the political world chiefly arising from their party services. Their power is the reverse of that which emanates from intellectual and moral dignity.

Frequently as the law is infringed, it is seldom that an American newspaper is brought in contact with a civil court. The law of libel is clearly defined in the statute-books; but American juries have tastes not very consistent with a too rigid administration of it. It is seldom, therefore, that the libelled individual looks beyond his walking-stick, his riding-whip, his pistol, or his bowie knife, for redress. The case of the novelist Cooper is an exception to this assertion. He brought several actions for libel against different papers, in some of which he adroitly pleaded his own cause, and in many of which he was successful. The libels of which he complained, arising as they did from literary criticisms, were not such as generally instruct and amuse the public. Had they been of a strong personal cast, it is questionable if he would have got a verdict sufficient even to carry costs. This, it must be allowed, indicates a low tone of public morals.

The foregoing sketch is applicable to the great majority of American newspapers. Very few can be named as exceptions to the general description. Some of these, it must be admitted, do honour to themselves, and credit to their country. Their political writing is cha-

racterised by temper, judgment, and ability; and the literary department of some of them is conducted in a style, and marked with a spirit, which would do no discredit to the most respectable journals of the old world. The great bulk of their contemporaries are, on the whole, more prejudicial than advantageous to the public morals and tastes. It is a pity to see so powerful an engine so wofully misdirected. If its energies emanated from proper principles—were the zeal which directs its efforts a zeal for man's intellectual and moral good—the press in America, from its increased and increasing power, might undo in a very short time much of the mischief which its vicious direction has entailed upon the country, and work a great social cure where it is now creating nothing but social disorders.

THE BARGAIN.

'MAY I trouble you to show me that dress-cap with blue trimmings in the window?' said a lady-like person as she entered a fashionable lace-shop.

The proprietor, with a polite bow, handed the lady a chair, and producing the cap alluded to, recommended it in the usual set phrases.

'Pray, what is the price?' inquired Mrs Mowbray with a dissatisfied air, after viewing it in every imaginable position, and scrutinising its materials and workmanship with the most patient minuteness.

'The price is seven shillings, madam,' answered the shopkeeper, rubbing his hands.

'Seven shillings!' exclaimed Mrs Mowbray; 'why, I have seen them marked up at a score of places for six, and at the bazaars they are cheaper still.'

'Excuse me, madam,' replied the shopkeeper, 'not such a cap as that, I think. Observe the fine quality of the materials, and the neatness of the workmanship. It is a first-rate article.'

'Oh yes, I see,' rejoined Mrs Mowbray; 'but the caps to which I allude are quite equal to it in every respect. The fact is, I do not particularly want it; but if six shillings will do, I will take it.'

The shopkeeper hesitated. 'I suppose you must have it then, madam,' said he with a saddened countenance, 'but really I get no profit by it at that price.'

'Oh,' said Mrs Mowbray with a bantering air, 'you shopkeepers never get any profit, if we are to believe you. You mean to say you do not pocket quite fifty per cent. by it.'

The shopkeeper, with a faint effort to smile, shook his head as he neatly folded and wrapped up the delicate article, and Mrs Mowbray having counted out the six shillings, he politely thanked her, opened the shop-door, and bade her good-day.

'There, Jane,' said Mrs Mowbray as she entered the parlour on her arrival at home, 'what do you think of my purchase?' holding up her new acquisition. 'Is it not a love of a cap? Guess what I gave for it.'

Jane examined it minutely, and guessed the price to be seven or eight shillings, the materials and work being, as she remarked, so very good.

'Only six shillings,' said Mrs Mowbray triumphantly; 'the shopkeeper asked seven, but I succeeded in getting it for six; and (putting it on, and walking up to the looking-glass) I assure you I am not a little pleased with my bargain.'

'Well,' said Jane, 'it is a wonder they can afford to sell such a cap for the money; the materials alone, I should think, would cost as much as that.'

'It is a wonder,' replied Mrs Mowbray indifferently, as she turned herself round before the looking-glass, and inquired of her sister how it suited her face, and

whether the colour of the ribbon were adapted to her complexion.

A loud double knock at this moment was heard at the door, and Mrs Mowbray, taking off the cap in the greatest trepidation, remarked that she would not for the world that her husband should know of her purchase, as her last month's millinery bill had been very heavy, and Edward would be displeased at what he would term her extravagance.

The cap was safely deposited before Edward had entered the room; who, throwing himself on the sofa, declared he was fatigued, and should be glad of a cup of tea.

'You are late, my dear, this evening, are you not?' inquired Mrs Mowbray.

'I am later than usual,' answered Mr Mowbray; 'I have been attending a committee-meeting of our benevolent society, which detained me some time.'

'Your benevolent society is always detaining you I think,' said Mrs Mowbray somewhat reproachfully; 'benevolent societies are very good things no doubt, but I think you have quite sufficient to do, both with your time and your money, without attending to any such things. What can we do for the poor? It is very well for those who have nothing to do, and plenty of money to spare; but I cannot see how persons with so limited an income as ours have any business with benevolent societies.'

'Well, my dear,' replied Edward, 'I have thought on the subject sufficiently to entitle me to a decided opinion; and I am sure if you had been with us to-day, and had heard the instances of the good we have already effected, you would not hold so lightly the exertions of even such humble individuals as we. I hope I am neither neglecting my business nor my home in these efforts, and I am confident you will rejoice with me when I tell you that we have good reason to hope that we are making some impression, however little, upon the vice and ignorance which have so long made those lanes and alleys at the back of our house a nuisance to the neighbourhood.'

'Of course, my dear,' said Mrs Mowbray, 'I wish always to sympathise with you in any of your efforts to do good.'

'We have some funds in hand,' remarked Mr Mowbray, 'and I have promised our committee to visit the poor families myself to-morrow, to ascertain their individual circumstances, and the best means of serving them. Let me add, my dear,' said he coaxingly, 'that I hope you will accompany me, and share with me the pleasure of inquiring into their necessities, and endeavouring to alleviate their distress.'

Mrs Mowbray would willingly have conceded to her husband the monopoly of this pleasure; but, after making a host of objections and excuses, which were successfully combated by him, was at last brought to acquiesce in his wish, and promised to be in readiness on the following afternoon to accompany him on what she nevertheless deemed a Quixotic expedition.

The next day Mrs Mowbray was reluctantly ready on her husband's return from business, and, roughly attired for the occasion, they started on their exploratory tour.

Leaving the main thoroughfare, with its genteel dwelling-houses and glittering shops, they turned down a little by-street, at the end of which they found themselves in the midst of a huge nest, as it were, of courts and alleys, which presented a striking contrast with the gaudy street they had just left. Mrs Mowbray was so shocked at the sight of such wretchedness, that she hesitated to proceed, till reassured by her husband, who well knew the locality, and had often visited the poor families there before.

The appearance of the spot was indeed deplorable, and not a little startling to one whose walks had been confined to the public thoroughfares. It was a lovely afternoon, yet even the sun's piercing beams could scarcely penetrate some of these cheerless gloomy nooks. Here were clusters of pestiferous hovels, some without doors, crowded with human beings, though unfit even for the habitation of the most valueless animal. In many, the old window-panes were almost all broken, while in others they were so dirty, and patched with paper or stuffed with rags, that they but very partially admitted the light of day. Ragged and vicious boys were gambling in groups, and barefooted children were playing about in the slimy mud, some squalid and puny in consequence of bad air and insufficient food, and others whose chubby features displayed, in spite of dirt and privation, a robustness of health that would have done credit to the nursery of a nobleman. Here were gaunt men, with dull meaningless countenances, sitting on their comfortless thresholds, and bony haggard women screeching for their strayed children, while the scarcely-coalesced forms of some of the younger females might have served as models for the painter or sculptor. Yet even here were traces of human sympathies of the purest kind. Girls were nursing their baby sisters with the most patient devotedness. The playful innocent-faced kitten, a universal favourite, frolicked about in the dirty window-sill; the social dog seemed quite at home with the children, as they shared with him their pittance of bread; and from many a superannuated saucepan and spoutless tea-pot, at the upper windows, grew the fragrant bergamot and the blushing geranium with strange luxuriance.

The appearance in such a neighbourhood of two well-dressed persons soon caused an unusual excitement, especially as Mr Mowbray was known among the poor inhabitants; and whenever he appeared there, it might be safely calculated there was something to be given away. Children, after a hasty glance at the intruders, left their playfellows and ran to their homes; heads were thrust out at the windows; some shuffled to their own rooms, that they might be ready if called on; others obtruded themselves in the way with an obsequious curtsy; some came to their doors with their little ones peeping from behind their aprons; and all around were on the tiptoe of expectation.

As they climbed the creaking stairs, and explored the naked garrets of the various houses, it was singular to mark the dissimilarity in character and circumstances of the various inmates—alike only in their poverty. Even in form and feature the contrast was striking. In the countenances of some might be unmistakably read the sensual and the brutish; while in the lineaments of others might be traced, notwithstanding dirt and rags, the predominance of the gentle, and even the refined. Here was the round-cheeked boor, who fattened amid the filth that seemed natural to him; and here the angular-featured man of thought and of observation, whom more favourable circumstances might have placed in a far different sphere. The student of human character could not have desired a finer field for the prosecution of his studies than such a one as this; and the more so, as character was here so forcibly developed for good or evil, unweakened by any of the influences which affect civilised life. Mrs Mowbray, as she joined her husband in kind conversation with the various families they visited, soon began to feel a deep interest in them, soothingly advised with them, and relieved some of their more pressing wants.

They had completed their intended round of visits, and were just leaving the court to return homeward, when a young woman, carrying in her hand a milliner's basket, crossed before them. She was very meanly clad, and her appearance bespoke deep poverty, yet there was an air of respectability about her that could not be mistaken. She evidently shrunk from observation; but as she looked up with a surprised air at the unusual sight of two respectably-dressed persons in such a place, her

sad countenance, beaming with intelligence, so forcibly impressed Mr Mowbray, that he stopped her, and asking her where she lived, expressed a wish to pay her a visit.

The young woman curtsied, and led the way to a house superior to most of those they had just left, but scarcely less wretched and ruinous. It was a large building, and had perhaps once been tenanted by the wealthy; but it had long since fallen into decay, and its lofty capacious rooms had been divided into a number of small ones, each of which now contained a family, large or small as the case might be. Mr and Mrs Mowbray followed the young woman up the wide staircase to the top of the house, and then turning into a long gallery, their guide stopped at length at a door, and, lifting the latch, with a curtesy and an apology for the untidiness of the humble room, ushered them into her apartment, and dusting the chair (there was but one), invited Mrs Mowbray to take a seat.

The room was spacious, and appeared the larger in consequence of being so scantily furnished. Some half-dozen old books lay in the window, a few articles of crockery-ware were arranged on a box in the corner of the room, and these, with a little table, a chair, and a box which seemed to serve occasionally as a seat, comprised nearly all the articles visible in the room. Everything, however, was clean and tidy, and there was an air of decency and respectability about the room which pleasingly contrasted with those they had just left.

'Do you live here alone, pray?' inquired Mr. Mowbray.

'No, sir,' replied the young woman feebly, 'my aged mother lives with me; but (pointing to a bed at the further end of the room, and which the gathering shadows of evening had prevented them from before observing) she is ill, and has been confined to her bed for the last month.'

'Have you no father?' inquired Mr Mowbray.

The young woman was silent for a moment as her tongue struggled to articulate an answer, while a tear trickled down her cheek.

'My father is dead, sir,' she replied: 'he died about six months ago after a short illness, and we were in consequence compelled to leave our former nice home, and take this room.'

'And pray how do you support yourself and your mother?' asked Mr Mowbray, glancing at the table, which was strewn with pieces of lace, ribbon, &c.

'I make caps and collars, sir,' said the young female, 'when I can get work to do; but it is very precarious, and so badly paid for, that I have been obliged to pawn nearly all our furniture to keep out of debt. I am unwilling that my poor mother should be chargeable to the parish; but my hardest exertions are insufficient to supply us even with bread.'

'Pray, whom do you work for?' inquired Mrs Mowbray, looking curiously at an unfinished cap which lay on the table.

'I work principally, madam,' replied the young woman, 'for the large lace-shop in the street close by. That cap, madam, will only bring me 5s. when it is finished, and I have already spent nearly a day in making it, and the materials cost me 4s. 6d. Even this poor profit is to be reduced, for my employer told me last night he could not afford to give me so much for them, as ladies refuse to give him his price.'

'Ladies, indeed!' exclaimed Mr. Mowbray indignantly. 'They little think, when they are so mercilessly hunting for bargains, how sadly they are diminishing the wages of the poor.'

Mrs. Mowbray turned her head aside and blushed deeply, for she recognised in the cap before her the counterpart of the one she had bought the preceding day, and in the employer of this poor young woman the laceman of whom she had bought it.

Mr. Mowbray made some further inquiries, and leaving the poor cap-maker a trifle, promised to send a

doctor to visit her mother, and to call on her again; and Mrs. Mowbray, before leaving, gave her an order, with an assurance that she would endeavour to interest her friends on her behalf.

Mrs. Mowbray, though ashamed and self-convicted, returned home pleased with her novel tour, and henceforward was the frequent companion of her husband on such occasions. Bargain-hunting had been in her case the result rather of thoughtlessness than of an unfeeling disposition; and from this time she was more liberal in her purchases, and never felt disposed to depreciate the value of an article without thinking of the poor cap-maker. She came to the wise conclusion, that an unnecessary or bad article can never be cheap, and that a good article is always worth a fair price. A bargain was ever afterwards associated in her mind with depreciated wages and the misery of the poor; and the charm which it had once possessed in her eyes was entirely dispelled by the recollection of the sorrow and oppression which were so often involved in its production.

POPULAR INFORMATION ON SCIENCE.

INFLUENCE OF LIGHT ON PLANTS AND ANIMALS.

Most persons are aware how indispensable air, heat, and moisture are to the development of vegetable and animal life; but it is not so generally known how intimately the agency of light is connected with the same operation. By light, we mean the diffusion of solar rays which are always less or more illuminating the earth's surface, and without which the vision of animals would be a useless and unnecessary gift. The emanation of rays from the sun is attended with two very obvious and well-known results, namely, heat and light; it also effects such a chemical change in the properties of bodies, as is exemplified in the Daguerreotype and other similar processes. Whether these three effects—light, heat, and chemical change—be different manifestations of one grand principle, or whether solar radiation be composed of three distinct principles, science has not yet determined; though, as far as experiments have gone, the latter seems to be the true conclusion. It is possible, for instance, by a simple contrivance, to receive the heat and reflect or throw back the light, or to admit the light and obstruct the heat; and it is equally possible to produce chemical effects which neither light nor heat of themselves could accomplish. The chemical influence of the sunbeams, or *actinism*, as it has been appropriately termed,* may act on substances which remain unaffected by heat or light; and light may perform its functions as in the matter of vision, where heating and chemical rays, were they to be active, might be positively deleterious. Presuming, therefore, that solar radiation is made up of three different sets of rays, we shall endeavour to point out some of the more obvious effects of light and actinism in the development of vegetable and animal life, distinguishing between their effects where we can, and speaking of them as one principle only where science has not yet been able to draw the line of demarcation.

The germination of vegetable seed is the change of the inert and apparent lifeless embryo into a living plant; and this is effected by the presence of heat, air, and moisture. The influence of light is destructive to this process; and it is only in darkness that a vigorous germination can be induced. But while the light-yielding rays of the sun retard the vivification of the vegetable embryo, the actinic rays have been found to forward the process in a remarkable degree. The same

principle seems to operate widely in the development of animal life; and when experiments have become more accurate and numerous, it will be found that actinism is as necessary to the vivification of the ova of many animals as it is to that of the vegetable embryo. Where the sunbeam spreads its genial influence, there life in all its myriad forms is found; where the sun-rays cannot penetrate, there space is a lifeless blank. At the surface of the ocean, and around its shores, marine animals and plants, varied in form and beautiful in colour, are found abundantly. As we descend, we find life gradually sinking in the scale of organisation; and below a certain depth, varying probably in different latitudes, no creature stirs the ever-silent sea. As in the ocean, so on land. The southern slopes of our hills and mountain ranges are always clothed with a more elaborated and more developed race of plants than the northern slopes; and this depends wholly upon the greater degree of light which the former enjoy. The northern side may sometimes be as verdant, but it never will be so flowery as the southern exposure; and the attentive observer may detect new tribes on either side almost as soon as he has passed the summit. The myriads of minute forms which are called into life under the tropical sun, seem to depend upon the same influence for their vivification—a vivification which, under simple light and heat, it has been found impossible to induce. It would seem, therefore, that actinism is a more subtle force than air, or heat, or light, or even electricity; that it brings us as it were to the confines of vital energy; and though not of itself a *vis creatrix*, yet indispensable to the manifestations of vitality.

It has been remarked, that a sunbeam cannot pass over a plate of iron without leaving indications of its path; so active, yet subtle, is the chemical principle of actinism. As with inanimate substances, so also with organic tissues: a sunbeam cannot fall on the leaf of a plant, or on the skin of our hand, without inducing a change which is manifested by an alteration of colour. The green hue which is universal in healthy vegetation, depends immediately and directly upon the influence of light. Every one must have seen the white and sickly stem of a potato grown in a dark cellar; and must have observed how it was attracted towards any feeble ray of light that did enter, as if in search of the element so necessary to its perfect development. The stem may have grown for months, shooting to the length of six or eight feet, and yet no trace of anything like the green colour of its perfect health will be discernible till it has come within the influence of solar light, and then a few days or even hours will suffice to clothe it in its natural hue. Mr. Ellis states, in the *Gardeners' Magazine*, that 'in North America the operation of light in colouring the leaves of plants is sometimes exhibited on a grand scale and in a striking manner. Over the vast forests of that country clouds sometimes spread, and continue for many days, so as almost entirely to intercept the rays of the sun. In one instance, just about the period of vernalion, the sun had not shone for twenty days, during which time the leaves of the trees had reached nearly their full size, but were of a pale and whitish colour. One forenoon the sun broke through in full brightness, and the colour of the leaves changed so fast, that by the middle of the afternoon the whole forest for many miles in length exhibited its usual summer's dress.'

The effects of light upon animal tissues is not less remarkable. In man, for example, it is well known that his complexion changes from fair to brown, and

* See a paper on Actino-Chemistry in No. 52 of our current series.

from brown to an almost sooty colour, by simple removal from a temperate to a tropical region; and though this may in some measure depend on original constitutional variation, yet in most cases the effects of strong solar light are too obvious to be doubted. The negro, with his sooty complexion and woolly hair, may be a different variety of the human species from the European; but there is also every reason to believe that the same pigmental apparatus which gives the dark hue to the skin of the former, is also present under the skin of the latter, and that it only requires an excess of solar light to bring it into full excreting operation. Even under the comparatively feeble light of our own latitude, the summer's sun will in a few hours convert the pale face of the sedentary student into a tawny brown—an action as purely actinic as the colouring of the leaves of the American forest. Heat and light cannot have anything to do with this change, otherwise the artificial fires and lustres of our apartments would produce some complexional alteration; but such is not the case; and since artificial and natural heat manifest themselves similarly, and since the eye is affected in the same manner by the beams of the sun and the rays of a gas lustre, this change of colour, caused by solar radiation, must depend upon some principle peculiar to sunlight—in a word, on actinism.

Production of colour is perhaps the most obvious of the changes produced in organic bodies by the influence of light; but there are others equally general and important. Vegetable growth is directly and immediately dependent upon it. It has been proved that the carbon or woody structure of plants is derived from the decomposition of carbonic acid, which they principally absorb by their leaves from the atmosphere; and that this decomposition of carbonic acid gas proceeds only when the plant is under the influence of solar light. Remove the plant from that influence to a dark cellar, or let the sun sink beneath the horizon, and the operation ceases. Solar light may therefore be said to be the prime promoter of vegetable growth; that influence by which the assimilation of carbon is effected and colour produced, and that power by which the circulation of their sap, if not wholly caused, is at least greatly facilitated. This last operation was tested by De Candolle. 'If you select,' says he, 'three plants in leaf, of the same species, of the same size, and of the same strength, and place them in close vessels, one in total darkness, the other in the diffused light of day, and the third in sunshine, it will be found that the first pumps up very little water, the second much more, and the third a great deal more than either. These results vary according to species and circumstances; but it uniformly happens that plants in the sun absorb more than those in diffused light, and the latter more than those in darkness; the last, however, pumping up something.' It is nevertheless worthy of remark, that although the direct solar rays are necessary for the decomposition of carbonic acid, the production of colour, and the promotion of circulation, yet the most feeble diffused light of day is sufficient to produce these results less or more in a natural state. Thus we find that plants growing in wells, on the north side of high walls, and in rooms partially darkened, become green, and often perform all their functions without much apparent inconvenience. Yet De Candolle found the purest daylight, the brightest lamplight, insufficient to bring about the decomposition of carbonic acid in an obvious manner. From this, therefore, we must infer, that it is neither heat-giving nor light-giving rays to which these results can be ascribed; but that they are directly owing to the actinic or chemical principle of solar radiation.

The influence of light or actinism is not concerned in the matter of growth alone, it is equally indispensable to the elaboration of the various vegetable secretions, and to the perfection or maturation of the seeds by which plants are propagated. 'We see in practice,' says the author of the article Botany, in the Library of Useful Knowledge, 'that the more plants are exposed to

light when growing naturally, the deeper is their green, the more robust their appearance, and the greater the abundance of their odours or resins; and we know that all the products to which these appearances are owing are highly carbonised. On the contrary, the less a plant is exposed to sunlight, the paler are its colours, the laxer its tissue, the fainter its smell, and the less its flavour. Hence it is that the most odoriferous herbs are found in the greatest perfection in places or countries in which the light is strongest; as sweet herbs in Barbary and Palestine, tobacco in Persia, and hemp in the bright plains of extra-tropical Asia. The peach, the vine, and the melon also, nowhere acquire such a flavour as under the brilliant sun of Cashmere, Persia, Italy, and Spain. This is not, however, a mere question of luxury, as odour or flavour may be considered. The fixing of carbon by the action of light contributes in an eminent degree to the quality of timber—a point of no small importance to all countries. Isolated oak trees, fully exposed to the influence of light, form a tougher and more durable timber than the same species growing in dense forests; in the former case, its tissue is solidified by the greater quantity of carbon fixed in the system during its growth. Thus we have every reason to believe that the brittle wainscot oak of the Black Forest is produced by the very same species as produces the tough and solid naval timber of Great Britain. Starch, again, in which carbon forms so large a proportion, and which in the potato, cassava, corn, and other plants, ministers so largely to the nutriment of man, depends for its abundance essentially upon the presence of light. For this reason, potatoes grown in darkness are, as we say, watery, in consequence of no starch being developed in them; and the quantity of nutritious or amylaceous matter they contain, is in direct proportion to the quantity of light to which they are exposed.'

The germination, colouring, growth, and maturation of plants may be considered as the great operations in which light or actinism is directly active; but there are other minor phenomena in the vegetable kingdom seemingly dependent upon the same influence. Thus the expansion and closing of the leaves and blossoms, the motions of the leaves, the twining of tendrils, and the like, all have regard to the presence or absence of solar radiation, and seem to receive its impressions as rapidly and certainly as does the photogenic paper of the artist. A passing cloud will interrupt the process of the Daguerreotype and calotype, and though we have not yet learned to mark such transient impressions on the leaves and blossoms of plants, yet certain we are that they must be affected by these interruptions. The white marigold closes its flowers on the approach of a rain-cloud; and many plants were observed to fold their leaves and blossoms during the solar eclipse of 1836. When a mere temporary absence or presence of sunlight thus affects vegetation, it is no wonder that its continued intensity should produce such results as we find in warm and cloudless climates. At the Cape of Good Hope, Herschel found by his actinometer (an instrument for measuring the intensity of solar radiation) that the force of sunshine was 48½, while ordinary good sunshine in England is only from 25 to 30; and from this we can easily account for the brilliancy of many of the Cape flowers, which we in vain attempt to rear in their native perfection in our stoves and conservatories. The gardener can readily furnish heat to any amount; but science has not yet discovered how to produce the subtle principle of solar radiation.

Turning now to the animal economy, we find growth, health, and development also curiously affected by the absence or presence of the solar influence. Dr Edwards has shown that if tadpoles be nourished with proper food, and are exposed to the constantly-renewed action of water (so that their bronchial respiration may be maintained), but are entirely deprived of light, their growth continues, but their metamorphosis into air-breathing animals is arrested, and they remain in the form of large tadpoles. He also observes that persons

who live in caves and cellars, or in very dark and narrow streets, are apt to produce deformed children; and that men who work in mines are liable to disease and deformity beyond what the simple closeness of the atmosphere would be likely to produce. It has been stated, on the authority of Sir A. Wylie, that the cases of disease on the dark side of an extensive barrack at St Petersburg, have been uniformly for many years in the proportion of three to one on the side exposed to strong light. Further, Dupuytren relates the case of a lady whose maladies had baffled the skill of several eminent practitioners. This lady resided in a dark room (on which the sun never shone) in one of the narrow streets of Paris. After a careful examination, Dupuytren was led to refer her complaints to the absence of light, and recommended her removal to a more exposed situation. This change was followed by the most beneficial results; all her complaints vanished. The more, therefore, that animals are exposed to the influence of light, the more freedom in ordinary circumstances do they find from irregular action and deformity. Humboldt has remarked that among several nations of South America, who wear very little clothing, he never saw an individual with a natural deformity; and Linnæus, in his account of his tour through Lapland, enumerates constant exposure to solar light as one of the causes which render a summer's journey through high northern latitudes so peculiarly healthful and invigorating.

It is not to be supposed, however, that exposure to continued solar light is a normal condition of existence; on the contrary, it seems that plants and animals, as well as inanimate nature, require a period of repose from that activity and motion of their elements which actinism so unerringly excites. A taper will no doubt burn brighter in a medium of oxygen gas than in common air, but it just consumes so much the more quickly. So it may be with bodies exposed to perpetual light. The vegetation of our own latitude springs, grows, and ripens slowly, requiring for its perfect development a period of several months; the plants of the arctic regions, under continual daylight, start suddenly into life, and perform their circle of being in a few weeks. In this particular, organic life seems strictly analogous to physical force: we cannot gain power unless at the expense of time, or gain time unless by the exertion of superior power. 'If,' says Dr Lindley, 'changes in their condition be requisite to the wellbeing of plants, so in like manner are the diurnal changes of light and darkness. If plants were kept incessantly growing in light, they would be perpetually decomposing carbonic acid, and would, in consequence, become so stunted, that there would be no such thing as a tree, as is actually the case in the polar regions. If, on the contrary, they grow in constant darkness, their tissue becomes excessively lengthened and weak, no decomposition of carbonic acid takes place, none of the parts acquire solidity and vigour, and consequently they perish. But under natural circumstances, plants which in the day become exhausted by the decomposition of carbonic acid, and by the emptying of their tissue by evaporation, repair their forces at night by inhaling oxygen copiously, and so forming a new supply of carbonic acid, and by absorbing moisture from the earth and air without the loss of any portion of it.'

It would appear, then, from what we have stated, that actinism, as distinct from mere visual light, is one of the most important and universal agencies in nature. We see its power everywhere around us, alike on animate and inanimate objects. Like the lyre of Memnon under the rays of the rising sun, organic life is thrown into motion by its influence; vitality is as it were revived, and even inert matter changes its hues and properties. As yet, its operations constitute an imperfectly-interpreted chapter in the history of creation; but the subject has interest and value sufficient to excite to its perfect explanation. Chemical action, magnetism, electricity, are subtle agents, and science has already subjected them in a thousand ways to the

purposes of human life: need we therefore despair of obtaining in time a like control over this ethereal principle of solar radiation?

DEGENERATE DAYS.

A VERY common phrase in the mouths of those who speak by rote, and who repeat from others, without any very distinct perception of its meaning, any sentence that to a limited understanding appears true or half-true, is, that 'the present are degenerate days.' These people—who are generally old, and have lost the capacity of all enjoyments except those of grumbling and argumentation—not only imagine that the world has been growing worse ever since the flood, but that a very great difference, to the world's disadvantage, has taken place since they were young. The weather is not so fine, the men are not so strong, and the women are not so beautiful, as when they were juveniles. They will not even allow a storm of these days to be equal to the storms of the past. The very thunder does not roar so grandly as it used to do, and the lightning is pale and feeble in comparison with the flashes that they have known. The wine of life they imagine is in the lees, and the fire of nature growing cold.

It is in vain to tell them that the fault is in themselves; that they have lost the power of enjoyment; that they have no longer the keen appreciation of the beautiful which they had in their young days; that their palates are dulled, and that, therefore, they consider the fine pine-apple to be no better than a pippin, and the golden pippin itself to be no better than the harsh uncultivated crab. No; they maintain that the fault is not in them, but in the age; and they could weep for its degeneracy, had they not too much philosophy to weep for anything.

We once knew a very fine specimen of this class of prosera. Our friend was about seventy-eight years of age, still tolerably hale and hearty, and in possession of a snug sum in the three-and-a-half per cents. He was the oracle of the chief inn of the village, in the parlour of which he was nightly to be seen occupying the large arm-chair, and laying down the law, like a Solon, to the juniors who surrounded him. Scrupulously neat and clean was he, well powdered was his scanty hair, carefully brushed were his black coat and gray nether garments, white as snow was his neckcloth, and brilliant were his shoes as the best blacking could make them. Remnant of ancient days, his queue hung over the collar of his coat, and scattered over it the floating powder in a silvery spray. Decently and comfortably had he passed this life; his character was unexceptionable; and a great man was he in his native village, and for five miles round it, and a mighty potentate in the parlour of the Red Lion. So great was the estimation in which he was held, that his portrait had been painted at the expense of the landlord, and hung up in a broad gilt frame over the mantelpiece, to fire the young with emulation, and keep him in the remembrance of those who might come after him.

This worthy soul had a word to say upon every subject; he was a 'dictionary of dates and universal reference,' and if he did not know any matter that might be in dispute, he pretended to know; and to the majority of those with whom he came in contact, this was the same thing. He swore that there was no eloquence in modern parliaments—no public spirit in modern ministers; that the abolition of the rotten boroughs had destroyed the nation; and that the sun of Great Britain had set for ever, unless we should return to the old system, increase sinecures and taxation, and go to war with the whole world, as we did in the days of the French Revolution.

In literature, his notions were equally antique. The latest novel he had read was Sir Charles Grandison, and the most modern poet, with whom he deigned to acknowledge acquaintance, was Pope. He had heard of Scott and his wonderful genius, but would not read

his works. When advised to do so, he inquired if he were equal to Shakspeare, and when answered in the negative, he tossed his head with a disdainful smile, and pined the degeneracy of the age, which, with all the boasted march of intellect, and the discoveries of science, could not produce another Shakspeare. 'And then your modern poets,' he exclaimed, 'your Byrons, your Moores, your Campbells, your Southseys; glorious John Dryden is worth them all—and Pope worth a thousand of them. Talk of poetry, indeed,' said he; 'An honest man's the noblest work of God;' and all your Childs Harolds, and Irish Melodies, and Pleasures of Hope, and Pleasures of Memory, and Ancient Mariners, and Christabels, and Thalabas, can never equal that one line; that line is indeed fine, and good poetry, and cannot be disputed.'

'But no poetry can be good, in the first degree of goodness, that is not true, and I maintain that that line is not true.'

'How?' said he, starting from his chair, and grasping his silver-headed staff in a paroxysm of astonishment and indignation as we spoke; 'not true?'

'An honest man may be a fool—a dolt, without ideas, enterprise, energy, or talent of any kind, beyond the talent of making a profit upon a yard of tape; and would he be as noble a work as Isaac Newton or Francis Bacon?'

'Sir, you have no taste or judgment,' said the stickler for degeneracy, 'or you would not speak thus. The world has degenerated, indeed, if one of this generation fails to appreciate that sublimest passage of our greatest poet. But I will not argue with you; you are no judge of poetry.'

'Well, perhaps not. But, leaving such matters of taste and opinion, you will allow that in one respect this age is much in advance of any other—the wonderful discoveries of science and art?'

'Ay, ay,' said he with a smile of triumph, 'you are coming to steam, I see, and railroads! Now, I maintain that steam is a curse, and not a blessing to society. Talk of your steamboats; give me the good ship, with all her sails swelling to the breeze, and skimming merrily over the waters, without a monstrous boiler in her inside, in danger of bursting every moment, and blowing every soul on board of her to destruction! And as for your railroads, give me the old highway I say. I never travelled by a railroad, and I never will. I love the old ways, the neat inns by the road-side, the civil coachman, the swift horses, and the merry bugle of the guard. No; railroads are the bane of all enjoyment in travelling; and, to say nothing of the danger of collisions, which may send the heads and limbs of five hundred passengers flying in the air in a moment, you cannot even enjoy a sight of the fields, and trees, and hills, and all the beauties of the country, if once you intrust yourself in the train. No, no; there can never come any good out of steam.'

'But,' said we, wishing to draw him out, and without the slightest hope that he would agree with us, 'suppose we concede that steam travelling is not so pleasant as it might be, you must at least allow that by means of steam we bring nations together—that we gain a victory over time and space, and aid the great cause of human civilisation by carrying our arts, our productions, our knowledge, and our religion, to remote regions—that, but for steam, and the impetus it has given to the intellect of man, we would not have enjoyed these blessings for ages yet to come. You will allow that?'

'Sir, I will not allow that any good is done by that. True, we carry what we call our civilisation into savage lands, but we carry our vices and our diseases along with it; and I am not sure that the savages are not better without us than with us. They are free, they are strong, they are healthy, and have few wants; and the utmost we do for them is to instil wants into them, which, when they cannot supply, they become miserable. No; they are better without us; we only make them as degenerate as ourselves.'

Our friend has long since been gathered to his fathers, but there are many more like him to be met with daily. The secret of their dogmatism is easily discovered, and it is vanity. If the world has degenerated, the greater their merit not to have degenerated with it. They fancy that they have remained bright when all has been growing dark, and they are pleased with themselves accordingly. It is fortunate that their fancies are harmless, and that the world can get on without them.

HEALTH OF TOWNS COMMISSION.

THE first volume of the Report of the Health of Towns Commission, which we noticed in a recent number of the Journal, contains the evidence on the 'causes of disease, and means of prevention'; the second, the more bulky of the two, comprises that bearing on the supply of water to towns, drainage, surveys, &c. We purpose, in the present article, to call attention to the fearful details of the former, which opens with an explanatory report by the commission, stating their object to have been the institution of inquiries 'into the present state of large towns and populous districts in England and Wales, with reference to the causes of disease amongst the inhabitants; the best means of promoting and securing the public health; the drainage of lands; the erection, drainage, and ventilation of buildings; and the supply of water in such towns and districts, whether for purposes of health, or for the better protection of property from fire; and how far the public health, and the condition of the poorer classes of the people of this realm, and the salubrity and safety of their dwellings, may be promoted by the amendment of the laws, regulations, and usages at present prevailing with regard to those matters.'

The whole of the evidence adduced on these points goes to establish that, 'defective drainage, neglect of house and street cleansing, ventilation, and imperfect supplies of water, contribute to produce atmospheric impurities which affect the general health and physical condition of the population, generating acute, chronic, and ultimately organic disease, especially scrofulous affections and consumption, in addition to fevers, and other forms of disease.' The startling facts brought forward as to the *creation*, we may call it, of scrofulous affections by impure air, are new, and present some of the gloomiest features of the volume, inasmuch as they prove the fatal effects of the pernicious influences complained of, in the existence of a deteriorating population, diseased in themselves, and bequeathing disease to a still more wretched posterity. Joseph Toynbee, Esq. one of the witnesses examined, appears to have devoted special attention to this part of the subject: on being asked as to his observation of 'the effect of defective ventilation,' he replies—'The defective ventilation appears to me to be the principal cause of the scrofulous affections, which abound to an enormous extent amongst our patients. When I have had a scrofulous patient come before me, I have always been able to trace this as one of the agents.' He cites the work of a French physician, M. Baudeloque, in which it is stated 'that the repeated respiration of the same atmosphere is the cause of scrofula; that if there be entirely pure air, there may be bad food, bad clothing, and want of personal cleanliness, but that scrofulous disease cannot exist.' The following facts are further quoted:—'The development of scrofula is constantly preceded by the sojourn, more or less prolonged, in air which is not sufficiently freshened. It is impossible to deny that hereditary disposition, the lymphatic temperament, uncleanliness, want of clothing, bad food, cold and humid air, are of themselves circumstances non-effective for the production of scrofula.'

'When it is seen, on the other hand, that this disease never attacks persons who pass their lives in the open air, and manifests itself always when they abide in an air which is unrenewed, and this whatever may be the extent of other causes, it appears evident that the non-

renewal of the air is a necessary condition in the production of scrofula. Invariably, it will be found on examination, that a truly scrofulous disease is caused by a vitiated air, and it is not always necessary that there should have been a prolonged stay in such an atmosphere. Often a few hours each day is sufficient; and it is thus that persons may live in the most healthy country, pass the greater part of the day in the open air, and yet become scrofulous, because of sleeping in a confined place, where the air has not been renewed. This is the case with many shepherds. It is usual to attribute scrofula, in their case, to exposure to storms, and atmospheric changes, and to humidity. But attention has not been paid to the circumstance, that they pass the night in a confined hut, which they transport from place to place, and which protects them from wet; this hut has only a small door, which is closed when they enter, and remains closed also during the day; six or eight hours passed daily in a vitiated air, and which no draught ever renews, is the true cause of their disease. I have spoken of the bad habit of sleeping with the head under the clothes, and the insalubrity of the *classes* where a number of children are assembled together.

An instance is adduced in corroboration: 'At three leagues from Amiens lies the village of Oresmeaux; it is situated in a vast plain, open on every side, and elevated more than 100 feet above the neighbouring valleys. About sixty years ago, most of the houses were built of clay, and had no windows; they were lighted by one or two panes of glass fixed in the wall; none of the floors, sometimes many feet below the level of the street, were paved. The ceilings were low; the greater part of the inhabitants were engaged in weaving. A few holes in the wall, and which were closed at will by means of a plank, scarcely permitted the air and light to penetrate into the workshop. Humidity was thought necessary to keep the threads fresh. Nearly all the inhabitants were seized with scrofula, and many families, continually ravaged by that malady, became extinct; their last members, as they write me, died *rotten with scrofula*.

'A fire destroyed nearly a third of the village; the houses were rebuilt in a more salubrious manner, and by degrees scrofula became less common, and disappeared from that part.' Other facts are brought forward, all tending to prove the fatal effects of vitiated air, and the beneficial results of a constantly pure atmosphere, not only on the health, but on the morals of the people. Other authorities—Dr Blacke, Dr Blakely Brown, Dr Duncan, and Professor Alison—fully confirm these statements, in addition to which, we are informed that 'defective ventilation may be considered one great cause of all the diseases of the joints which we so frequently meet with, as well as of the diseases of the eye and skin—shingles, lepra, and *porrigo*, or ringworm. Besides the eye, the ear is injuriously affected by vitiated air, which thus becomes the cause of many cases of deafness. It is a fact, that at least two times more of the children of the labouring-classes are affected by earache and deafness, than of children of the rich and better-conditioned *classes*, less exposed to the like influences.'

The report in continuation states, that fifty towns were selected by the commission, 'where the rate of mortality appeared, by the returns of the registers of deaths, with a few exceptions, to be the highest.' These included the largest manufacturing towns and principal ports after London, comprehending a population of more than three millions of persons. Each of these towns was visited by the commissioners, who examined into their condition on the spot, particularly of the most crowded and the most unhealthy districts, making personal inquiries of the inhabitants, and hearing such statements as were made by them, or respecting them, by medical and other officers.

In the evidence of Dr Duncan, physician to the Liverpool dispensary, we are made aware of the great extent of mortality arising from defective drainage, cleansing,

This witness brings forward two tables, showing the difference of mortality in town and country districts; in an area of the latter, equal to 17,254 square miles, the number of inhabitants to each square mile being 205, the annual mortality was as 1 in 54·91; while in town districts, comprising an area of 747 square miles, the inhabitants to each mile being 5045, the rate of mortality for the same period was 1 in 38·16.

More than one cause may be assigned for this marked difference in the two districts; but the one great cause, which in its operation seems to absorb all others, is the vitiation of the atmosphere of towns; to effect which many agencies are constantly at work. By the mere action of the lungs of the inhabitants of Liverpool, for instance, a stratum of air sufficient to cover the entire surface of the town, to the depth of three feet, is daily rendered unfit for the purposes of respiration. Add to this the exhalations from forges, furnaces, and other fires, the enormous combustion of gas, oil, and candles, nightly consumed in large towns, with the escape of gaseous effluvia from manufactories, and we shall have some idea of the vitiation of the air of towns.

It has been estimated, from the census of 1841, that the number of the working-classes of Liverpool is 160,000, who are distributed as follows:—

In 1982 courts, containing 10,692 houses,	
the inhabitants are	55,534
In 6294 cellars,	20,168
In 621 do.	2,000

thus showing that one-half only of the industrious population live in rooms or houses facing the street, or in a comparatively pure atmosphere. The courts consist usually of two rows of houses placed opposite to each other, with an intervening space of from 9 to 15 feet, which communicates with the street by a passage or archway about 3 feet wide, often built up overhead, and the farther end closed by a wall, or other building. Such an arrangement almost bids defiance to the entrance and circulation of air. Of these courts, 629 are closed at both ends, 875 are closed at one end, and 478 only are open at both ends.

If the courts are, as described, the noisome sinks of impurity, the cellars are still more horrible; 'they are generally 10 or 12 feet square, and flagged; but frequently have only the bare earth for a floor, and sometimes less than six feet in height. There is often no window, so that light and air can enter only by the door, the top of which, in numerous instances, is not higher than the level of the street. They are of course dark, and, from the defective drainage, are also very generally damp. Some of them have a back-cellar, used as a sleeping apartment, having no direct communication with the external air, which, with its supply of light, must be derived solely from the front room.'

Can it be matter of surprise that disease and depravity exist to such an alarming extent in these dens, when we know that in 26 streets inhabited by the working-classes, two-thirds of the houses were without yard, ash-pit, or other convenience. The consequence is, that the surface of the ground is covered with putrescent and offensive matter, which, when sufficiently fluid, sometimes 'oozes through into the neighbouring cellars, filling them with pestilential vapours, and rendering it necessary to dig wells to receive it, in order to prevent the inhabitants being inundated. One of these wells, four feet deep, filled with this stinking fluid, was found in one cellar under the bed where the family slept.'

These cellars are often used as lodging-houses, chiefly for the migratory Irish; 'the floors, sometimes the bare earth, are covered at night with straw; and there the lodgers—all who can afford to pay a penny for the accommodation—arrange themselves as best they may, until scarcely a single available inch of space is left unoccupied. In this way as many as thirty human beings or more are sometimes packed together underground, each inhaling the poison which his neighbour generates, and presenting a picture in some degree of the Black Hole of Calcutta. Such is the state of things in the courts of the night.'

vitates about 300 cubic feet of atmospheric air; and if we suppose 30 pair of lungs engaged in this process, we shall have 9000 cubic feet of air rendered noxious during the period of sleep. But as the cubical atmospheric contents of the cellars do not exceed 2100 feet, the thirty individuals are consequently furnished with a supply of air sufficient only for the wants of seven.'

We have dwelt at some length on this part of the evidence, from a conviction that the evils of imperfect ventilation are almost universally disregarded. To what other cause can be attributed the reluctance to open a window for the admission of air, which so many persons exhibit; the absurd custom also of closing bedrooms during the night against the entrance of air. Not only are doors locked, and windows fastened against the pure circulation, but it is still further impeded by the close curtains of the bed; the consequence is, that the atmosphere of a bedroom in the morning smells more like that of a charnel-house than an apartment fit for the repose of human beings. With one more extract from the doctor's evidence, bearing on the deadly effects of foul air, we must leave this part of the subject. 'It will be proper to say a few words as to the nature of the effluvia arising from cess-pools, and other offensive sources. The principal gas given out from these deposits is sulphuretted hydrogen, the most deadly of the gaseous poisons, two or three cubic inches causing instant death when injected into a vein, or into the chest, or beneath the skin of animals. A rabbit died in ten minutes after being enclosed in a bag containing sulphuretted hydrogen, although its head was left free so as to allow it to breathe the pure atmosphere. Nine quarts injected into the intestines of a horse killed it in a minute; a dog was killed by being made to breathe a mixture of one part of this gas with 800 parts of common air; and air containing only 1:1500th part of sulphuretted hydrogen proves speedily fatal to small birds. Although these effluvia are breathed by the inhabitants of our courts and back-streets in a state, of course, of extreme dilution, we cannot suppose that they are on that account entirely harmless. What, in a concentrated form, is so very deadly, must, in a diluted state, be injurious to health.'

It is sickening to contemplate the physical evils here described; these, however, sink into comparative insignificance when compared with the moral degradation that necessarily ensues. Mr Toynbee, in reply to a question as to the over-crowding of rooms, observes that, 'in respect to morals, as well as health, it is terrible. I am now attending one family, where the father, about fifty, the mother about the same age, a grown-up son, about twenty, in a consumption, and a daughter, about seventeen, who has scrofulous affection of the jaw and throat, for which I am attending her, and a child—all sleep in the same bed, in a room where the father and three or four other men work during the day as tailors, and they frequently work there late at night with candles. I am also treating, at the present time, a woman with paralysis of the lower extremities, whose eldest son, the son by a former wife, and a girl of eleven or twelve years of age, all sleep in the same bed.' Mr Aldis, physician to the London dispensary, states, that he has 'found grown-up young men sleeping in the same bed with a middle-aged or young mother; brothers and sisters, above the age of puberty, lying in the same bed. But the moral effects only come to our knowledge accidentally.' Mr Hawkey, of Nottingham, says, that 'rooms of eleven feet square often contain families of four, five, or six individuals, consisting not unfrequently of nearly-related adults of different sexes, who live and sleep promiscuously.'

We gladly turn from the perusal of these cases of depravity, induced, in a great measure, by local circumstances, to the promise of amelioration—to the prospect of convenient and healthful dwellings for the busy multitudes—to the constant and abundant supply of pure and wholesome water—to the erection of baths and wash-houses, furnishing the means of cleanliness at an

almost nominal price; and in their effect rendering the working-man's home a scene of pleasure and hope, where the practice of cleanliness shall pave the way for other and equally exalting virtues.

The publication of a report such as the one under consideration, is in itself an encouraging and unmistakable sign of the times; it proves that right feelings are making progress; that they who have begun the good work are earnest in persevering. The commissioners say, in concluding their report, 'We have especially turned our attention to the means for improving the worst and the most crowded districts in large towns, a subject of great importance, and very great difficulty. It may appear to be a comparatively easy task to provide against the occurrence in new districts of the evils which at present prevail in parts of old towns; but in the heart, and even in the immediate suburbs of towns, not only of ancient but also of modern date, where these evils chiefly abound, the value of the property, the intricacy and variety of the interests involved, and the occupations and callings of the inhabitants, increase in a great degree the difficulty of devising measures which we may with confidence be able to recommend as effectual, and at the same time as capable of enforcement. In order to admit of the recommendation of systematic and comprehensive measures, adequate to the magnitude of the subject, many practical details are involved, which must be minutely examined and viewed equally in respect to accuracy of principle, economy of execution, and adequate provision for regulating and defraying the necessary expenses. This subject is still engaging our most anxious attention.'

We intend to return to this subject in a future number, in which we shall consider the remedial measures to be gathered from the evidence of the second volume. Meanwhile, much remains to be done. The announcement of difficulties should be a spur to exertion; much may be done individually in anticipation of the good that may be expected to result from the institution of inquiries like the present. The many important facts elicited are worthy of the most serious attention: the cause is one which enlists our highest sympathies—one in which all are concerned—and to which all, if they will, may contribute their assistance.

PERIODICAL WORK CONDUCTED BY LUNATICS.

LUNATICS, who, fifty years ago, were dungeoned and whipped, are now treated to balls and soirées, they conduct farms, and are admitted to public worship. A new feature has been developed in their treatment at the Crichton Institution, Dumfries: they there club their wits to prepare and issue a monthly periodical sheet. The first number of *The New Moon, or Crichton Royal Institution Literary Register*, appeared on the 3d of December, in the form of a double leaf in quarto. It is sold to the public, but we are not informed at what price. In the prospectus, the fact of the exclusive management of the work by inmates is asserted; and the object is stated to be, a humble endeavour to lead persons of that class 'to think aright on the chief subjects which should occupy their attention under present circumstances, so that they may leave the institution wiser and better men and women than they entered it.'

Not only is the literary matter sane in its general tone, and rhetorically correct, but there is positive merit in several of the little articles. For example, a gentleman signing himself Sigma, thus addresses Dr Browne, the superior of the establishment (and we would ask if many men under Thomas Moore could write in the same style more smartly):—

'I am sorry to learn you have got rheumatism, Which is, I am told, a corporeal schism
Not very unlike what is called Puseyism.
If you take my advice, my kind friend, you want follow
The cold-water cure of that Fluvius Apollo,

Who at Graefenberg cures old and young of the dumps,
By the magical aid of a couple of pumps.
Old Pindar, 'tis true, as you very well know,
In the choicest of Greek has proclaimed long ago,
"Ariston men hudo!" but, then, what of that?
The man was a pagan—so, *verbum sup. sed.*
Your kids, you will learn with much pleasure, I know,
Are all as you left them, and in *status quo*.
(This same is a classical phrase, else, ecod!
I would break Priscian's head, and write *status quod*;
Some mad as March hares, but a few like the Dane,
With a slight touch north-east, yet otherwise sane. * *
Mr Sacre, that sage transcendental philosopher,
(I wonder if ever he read Alexander Ross over?)
As his use and wont is, has been blowing the balmy,
And looks, as a smoker should, really quite palmy.
He swears the debates are detestable stuff—
Not worth a cigar, or a pinch of Scotch snuff;
And, faith, I believe that for once, *entre nous*,
He's not very far wrong—I'm blown if I do.
At billiards to-day I gave him a Maul;
And wasn't he savage? ho, no! not at all:
He fumed and he fretted—"The cues were a scandal,
And really unfit for a gentleman to handle;"
Then concluded by saying, he would give me thrice six
Out of twenty-four points, and beat me to sticks!" * *

'J. C.,' who from his style seems of clerical education, preaches to the following effect, and however trite the ideas, assuredly their arrangement here is as good as could be expected from any other quarter whatever:—
'Although it is a proper, natural, and laudable wish to be splendidly and extensively useful, yet as every man is most delighted with the esteem, and interested in the good conduct and happiness of his domestics and friends, he ought to be the more careful to "walk before his house with a perfect heart." That such instruct their families and lead them in the ways of righteousness, is what is required of them. This is the province of which the care has been assigned to, and of which the improvement will be required at their hands; and he who exerts himself in this his station and sphere of action, however low or limited, is as meritorious in the sight of God, and likely to be as happy in himself, as he who, disengaging himself from all domestic ties and duties, gives a wider but more contingent range to his zeal and philanthropy, and encompasses sea and land to promote the improvement, reformation, and happiness of his fellow-men. But, above all, it certainly deeply concerns parents to set a good example before their children. This is equally beneficial to the public and to themselves; and the neglect equally fatal to both. If ever any real and substantial reformation of society is to be effected, this is the source from which it must flow; the sure foundation must be laid in the instruction, education, and moral training of youth.'

We conclude with a short lyrical poem, which has, we think, absolute merits sufficient to entitle it to notice, apart from all consideration of the interest arising from the condition and circumstances of the writer:—

'The harp so loved awakes no more,
Its chords are mute, its charms are gone;
The mind may joy not in its lore,
Where hope and happiness are flown.

For though it soothed in other days,
It cannot reach a wo so deep
As that which o'er this bosom strays,
To wake the pangs that never sleep.

The wind blows cold o'er glen and hill,
And nature all is worn and wan;
But nature's bosom bears no ill,
Like that which haunts the heart of man.

What though the torrents dash the steep,
And frosts her flaunting flowers deform,
And bid her lift her voice and weep,
In thunder, strife, and winter's storm;

The life remains that genial spring
Can still to wonted state restore,
And cause her wide her glories fling
O'er all that lay so waste before.

The wild bee hums around the flower
That ope so brightly on the braid;
The bird sings from the budding bower,
And cheers the wanderer on his way.

And far upon the moorland gray,
The plover seeks its summer home;
And sunshine crowns the scene of day,
As far as foot or eye can roam.

And thus are nature's charms replaced,
As if they had been ever new;
Her garlands blooming on her breast,
Her ringlets beaded with the dew.

But when, amid life's devious track,
Draws on the darkness of decay,
Oh, what to man shall ere bring back
The charms that time hath swept away!

And if the young must oft deplore
The ills that curb their early glee,
Oh, what again shall joy restore
To my loved mountain harp and me!—J. R.'

It might be asked, Supposing the writers of these extracts had been at liberty, and had been guilty of some capital outrage, would not such compositions have proved as strong proofs of their sanity, and consequent liability to punishment, as any that have been adduced in cases where punishment has been suffered, or, at best, narrowly missed (that of Macnaughton, for instance)? and yet these persons are deemed fit inmates for a lunatic asylum, and actually are in such an asylum at this moment.

SHORT NOTES ON THE WEST INDIES.

BY A LATE RESIDENT.

THIRD ARTICLE.

The Economy of Estates.—The negroes in Jamaica have a song, the burden of which is 'Massa, me no dead yet; car' him along.' The following is given as its origin. About forty years ago, the owner of a certain property was in the habit, when any of his slaves became old and useless, of directing them to be carried to a 'gully' on his estate, and there left to whatever fate should befall them—such fate being to be devoured by the crows before life became extinct. The object of this proceeding was, that the monster of a master should be saved the cost of keeping the old slave in his last days; and in order that he might lose as little as possible even by this transaction, he always directed that the dying man should be stripped naked, and his clothes brought back, together with the board which had been used to convey him to his miserable destiny. It happened that on one occasion a poor wretch, who was being so disposed of, collected sufficient courage and strength to exclaim, 'Massa, me no dead yet,' at the same time imploring to be saved from the horrible death which apparently awaited him. His brutal master, however, was deaf to his intreaties; and the bearers of the sick man hesitating, as one naturally supposes, whether they should proceed with their burden, the master sternly cried out, 'Carry him along.' This was the origin of the song—now for the sequel of the story. The poor man was taken to the gully, and there stripped and left, as directed by his master. In the night, however, came some of his friends, who, finding him still alive, took him to their homes, and, unknown to their master, bestowed such care upon him, that in course of time he recovered, and gained sufficient strength to leave the property. One unlucky day the poor fellow encountered his master in the streets of Kingston. The latter was thunderstruck. He had, however, sufficient presence of mind not to lose sight of his interest. At once claiming the 'dead-alive' as his slave, he ordered his attendants to take him into custody, and conduct him home. But the old man had no idea of undergoing a second exposure to the crows. He justly thought he had a fair claim to the free disposal of the few remaining days of his life. Accordingly he made such resistance, and uttered such cries, as speedily collected a crowd about him. His tale was soon told—the people were shocked and infuriated at the horrid recital, and, had his master not decamped, they would most probably have immolated him upon the spot.

This short narrative will give a forcible idea of the slave system as it once existed. Happily for the state of society in the colonies—nay, happily for the African race—that system has gone by never to return, and men have now not only safe custody of their lives, but of their property and persons. With this change it is evident a corresponding alteration must have taken place in the economy of estates and plantations. Apparent, if not heartfelt kindness, must have succeeded to brutality; and honourable inducements have thrust aside coercion and the scourge. Were it otherwise, matters would not go on at all. The fact is, where attorneys once sought overseers of a stern, unbending, nay, cruel temper, they now seek for those of kind, conciliating, yet firm dispositions; and I have reason to believe that not a few attorneys have been shorn of their honours, who found it impossible to accommodate themselves to the new spirit of things.

Attorneys, overseers, bookkeepers, and, in the olden times, drivers, are the chief animal machinery by which an estate is managed. The condition of a bookkeeper is little removed in comfort from the meanest labourer. His title implies a sort of clerk, who keeps the books of the estate, but he has as little to do with them as with the proceeds of the crop. His department is that of a general drudge, and his position that of an upper servant. He is barely tolerated at the table of the overseer, particularly if the attorney be present; and must be satisfied with such fare as is given him. The neck of a fowl is generally considered as his peculiar perquisite, and is known under the title of 'the bookkeeper's wing.'

In course of time the bookkeeper rises to the grade of overseer—a functionary who, in the absence of the attorney, rules paramount upon an estate. The dissolute life led by this class of persons had, under the old system, become proverbial. Much must be laid, however, to the system itself, and to the circumstances in which the overseers were placed. As bookkeepers, their days were spent in the fields; and, having no better society, and but slight moral culture, their nights were devoted to the company of dissolute women on the estates. As overseers, they had more time on their hands, and more liberty to devote it to some good purpose. Ere this, however, their habits were formed, and little disposition would be felt to improve it. If we add to all this, that the tenure by which the overseer held his office was the will or caprice of the attorney, and that he might be thrust from his situation without a day's notice, we see at once that his habits could not have been otherwise than dissolute. Many overseers, by dint of economy and 'perquisites,' ultimately became owners of estates. The next most probable step, however, upwards, was that of attorney; and as the overseer was, as it were, the king of bookkeepers, so was the attorney the king of overseers. He stood, in fact, *in loco* proprietor, and matters went on smoothly or not, according to his supreme will. A triton among the minnows, a Jupiter among the gods, was this same attorney, and marvellous the deference which was paid him—great the fear in which he was held. Pleased or chafed—

'He speaks, and awful bends his sable brows,
Shakes his ambrosial curls, and gives the nod,
The stamp of fate, and semblance of a god—
Poor Busha, with trembling dread signal takes,
And every blackie to his centre quakes.'

Like Jupiter, however, the attorney now finds himself less mighty than of yore; the proprietor occasionally landing the thunderbolts, which, like another Vulcan, he alone had forged. To quit metaphor. Proprietors, in a few instances, I have heard, now take charge of their own estates, and it is hoped and anticipated that their example will be followed by many others.

The buildings on an estate or plantation generally consist of the 'great house'—place of residence for the proprietor, or the attorney, whenever he happens to visit the estate; the overseer's house—the 'works,' or buildings where the several operations in the manufac-

ture of sugar, or curing of coffee, are carried on; and the 'negro houses,' or, as they have been sometimes of late years termed, 'villages,' generally removed away from the view of the great house, or overseer's house. The cattle chiefly used on estates are oxen and mules; and the motive power otherwise resorted to, when steam is not employed, is water.

Grades of Society.—A 'merchant' is a term of somewhat wider signification in the West Indies than in England. Nearly every person in business, whatever the extent of his dealings, or the nature of them, is called a merchant. The party who sells a small quantity of spirits, or a single ham, is called a 'provision and spirit merchant'; and he who will sell a single piece of linen, or a yard of ribbon, a 'dry-good merchant.' Many, however, deal at the same time largely in these several departments; but even these would not in England be entitled to the term. The merchant, including in the term the several grades referred to, seems to take about the first rank in colonial society; for although professional men, on stated occasions, take a higher stand, yet their far smaller number throws them comparatively in the shade. The title is, in fact, regarded as a universal passport—a sort of 'open sesame' into society. Few public undertakings succeed which are not patronised by the merchants; and the merchant's clerk thinks himself entitled of right to a commission in the militia, so soon as he writes himself down partner or master.

Probably the planter takes the next stand. I should find myself in doubt whether he ought not to be placed first, were it not that he is for the most part dependent on the merchant for the means of carrying on the cultivation of his estate. This at once settles the question. To place the dependent before him on whom he depends would be a solecism in manners most unpardonable. Let the planter, therefore, occupy the second place.

There is some difficulty in filling up the third grade. Two classes, of seeming equal pretensions, put in their claim, and leave me in doubt. Merchants' clerks and customhouse officers, lawyers' hacks and tide-waiters, contest the palm. We will leave them to settle precedence.

Those classes of persons called sometimes fancy storekeepers and shopkeepers, undoubtedly come next. The former are a description of milliners and haberdashers, and the latter a mixture of publicans, bakers, grocers, cheese-mongers, Italian warehouse-keepers, &c. The fancy storekeepers, in honour of the ladies, should perhaps come first, the others next.

Then follows a heterogeneous mass of tradesmen—builders, carpenters, joiners, cabinetmakers, bricklayers, pedlars, servants, &c. &c. all respectable or not, in colonial parlance, according as they may be black or white.

Editors of newspapers seem, as in England, to take rank according to the individual character of the party. Sometimes they are among the most respectable and influential classes, sometimes of the lowest characters, properly estimated.

For the most part, the two first classes above referred to 'rule the roast' in the West Indies. Since the levelling of all social distinctions, however, and the extension of the franchise, considerable approaches to a balance of power has been effected.

Two great requisites, to render society in the colonies what it should be, may be here mentioned. These are, a steady working-class, with no foolish aspirations upwards; and a wealthy and thoroughly independent body of men, above the paltry airs and local prejudices which are occasionally put on by many who now do wealth and assume independence. Until these are obtained, society in the colonies must remain as disjointed as a human body without a head and but half a trunk.

Negro Riddles.—'Ma riddle, ma riddle; guess the riddle; p'rhaps not. What is that which goes up black and comes down white? you give it up? Milk.' 'Ma

riddle, ma riddle, &c. Pretty Miss Nancy was going up stairs, when she tore her fine yellow gown, and not a sempstress in the town could mend it; you give it up? A plantain.' 'Ma riddle, ma riddle, &c. Up chim-cherry, down chim-cherry, nobody can catch chim-cherry; you give it up? Smoke.' It is to be observed that the asker is always as anxious to tell the solution of the riddle as the seekers to discover it. Thus the latter have frequently no time allowed them to 'give it up,' ere out it comes.

A Nancy Story.—Once upon a time there lived two sisters very happily together. At length, however, one of them fell ill and died, leaving a little daughter to the care of her sister. This sister was very cruel, and treated her niece very badly, making her a drudge to herself and daughter. One day the child having broken a water-jar, was turned out of the house, and ordered not to return till she could bring back as good a one. As she was going along weeping, she came to a large cotton tree, under which was sitting a woman without a head. The old woman immediately inquired of her, 'Well, my pickaninny, wha' you see?' 'Oh, grandee,' answered the child, 'me no see nuttin.' 'Good pickaninny,' cried the old woman, 'and good will come to you.' Not far distant was a cocoa-nut tree, and here was another old woman, also without a head. The same question was asked her, and she failed not to give the same answer, which had already met with so good a reception. Still she travelled forward, and at length began to feel faint through want of food, when, under a mahogany tree, she not only saw a third old woman, but one who had at length got a head. She stopped and made her best curtesey. 'How d'ye, grandee?' (grandee, or grandmother, is always a term of respect given to an old woman) said the girl. 'How d'ye, my pickaninny, wha's maka you no look well.' 'Grandee, me berry hungry.' 'My pickaninny, you see dat hut yander; go da, an' you wi' find some rice in one pot; nyam it; but if you see one black puss, mind you give him him share.' The child hastened to profit by the permission; the 'black puss' made its appearance, and was served first to its portion of rice, after which it departed; and the child had but just finished her meal, when the mistress of the hut entered, and told her that she might help herself to three eggs out of the fowl-house, but that she must not take any of the talking ones; perhaps, too, she might find the black puss there also, but if she did, she was to take no notice of him. The girl then entered the fowl-house, but she had no sooner done so, than a great many eggs commenced crying out, 'take me, take me.' However, she was implicit in her obedience; and although the talkative eggs were large and fine, she searched about till she had collected three dirty-looking eggs, which did not talk. The old woman now dismissed her guest, bidding her return home without fear, but not to forget to break one of the eggs under each of the three trees near which she had seen an old woman in the morning. The girl did as she was told, and breaking the first egg, it produced a water-jug exactly similar to that which she had broken; out of the second came a large sugar estate; and out of the third a splendid equipage, in which she returned to her aunt, delivered up the jug, related that a strange grandee had made her as grand as she was, and then departed in triumph to her sugar estate. Stung by envy, the aunt lost no time in sending her own daughter to search for the same good fortune which had befallen her cousin. She found the cotton tree and the headless old woman, and had the same question addressed to her; but instead of returning the same answer, 'Wha' me see?' said she, 'Me see one old woman widout head.' 'Bad girl,' replied the old woman, 'and bad will come to you.' Matters were no better managed near the cocoa tree, and when she came to the mahogany tree, she scarce deigned to salute the old woman at all. However, she received permission to eat rice at the cottage, coupled with the injunction of giving a share to the black puss, an injunction, however, which she totally

disregarded, although she scrupled not to assure her hostess that she had suffered puss to eat till it could eat no more. The old lady then despatched her to the fowl-house for three eggs as she had before done her cousin; but having in a similar manner been cautioned against taking the talkative eggs, she conceived that these must needs be the most valuable, and made a point of selecting those which talked the most. Then, lest their chattering should betray her disobedience, she thought it best not to return into the hut, and accordingly set forward on her way home. She had not, however, yet reached the mahogany tree, when curiosity induced her to break one of the eggs. To her infinite disappointment it proved to be empty. In a rage she dashed the second on the ground, when out came a large yellow snake, which flew at her with dreadful hissings. Away ran the girl; a fallen bamboo lay in her path; she stumbled over it and fell. In her fall, the third egg was broken, when out came a huge tiger, which straightway slew and devoured her, as a warning to all rude, disobedient, and lying children.

Nancy stories are a kind of nursery and legendary tales with which the negroes amuse each other, and the young children of their masters or mistresses' family. A principal ingredient in them is the marvellous and startling, and they have also always a moral. The moral in that which I have just related is good, while the points of satire occasionally developed are excellent. Their effect on children, however, is far from salutary, as it renders them superstitious and fearful of being alone, particularly in the night-time. Accompanied with wild or mournful chants, as the occasion requires, they are at times rendered very impressive, and have all the influence of ghost stories, with far more ingenuity. I need not say that the art of telling a Nancy story, or inventing one, is not possessed by every negro, and that it is consequently much thought of among them, particularly among the 'old tune' negroes. To be capable of inventing one of these tales certainly displays some literary talent, which, if cultivated, might have produced greater things. Many negroes require to be paid before they will unfold their tales, asking sometimes as much as threepence for each story. The practice, however, is discouraged by the elder portion of families, in consequence of the pernicious effects produced on the minds of children.

THE INDIAN MAIL.

In a former volume we furnished a detailed account of the route through France, the Mediterranean, Egypt, the Red Sea, and Indian Ocean, to Hindustan.* We are now enabled to add a few more interesting particulars regarding the detailed operations of the means by which mails and passengers are conveyed.

The time ordinarily occupied for performing the whole distance is thirty days, thus distributed. From London to Paris occupies one day, Paris to Marseilles three days, Marseilles to Malta four days—thence to Alexandria four days. From Alexandria, by way of Cairo, to Suez, three days, and from Suez to Bombay fifteen days; except during the raging of the monsoon, when the voyage takes ten days longer. When the railways through France are completed, even this short time will be abbreviated at least two days.

Every month, a vessel belonging to the Oriental and Peninsular Steam Navigation Company leaves Southampton for Gibraltar direct, with mails and passengers; thence reaching Malta, she takes in a second mail and party of passengers, which have left London five days later, having been conveyed, by way of Calais, to Marseilles by diligence, and from Marseilles to Malta by steamboat. The Oriental Navigation Company's vessel then sails for Alexandria with her double freight. The passengers and mails then descend the canal

of Mahomedeh to Atfeh, where it joins the Nile, which they ascend to Bulac, the port of Cairo. They have then to cross the desert to Suez, which is accomplished in the following manner:—An association, sanctioned and protected by the pasha of Egypt, has recently been formed. Under the name of the Egyptian Transit Company, it bought up the transit establishments of Messrs Hill and Waghorn. They provide carriages on two wheels, each drawn by four horses, and the eighty miles of desert is crossed in twenty-four hours, or more than double the time which a stage-coach on an English road would take to perform a similar journey; but the sandy and stony nature of the road opposes difficulties which sufficiently account for delays. The tents from the Eglintoun tournament, which we mentioned in our former article as having been set up at various stages along the route, have been struck, and regular stables for the horses, and inns for the passengers, since erected. There are seven of these structures, which are designated simply by the numbers they bear. Nos. 1, 3, 5, and 7, are nothing more than stables, in which relays (consisting of from twelve to sixteen horses) are kept. Nos. 2 and 6 contain, besides stables, only bare accommodations for refreshment—dining-rooms and kitchens. Here the passengers stop to partake of breakfast, dinner, or supper, according to the hour of their arrival. No. 4 is the only building which has all the accommodations of a hotel, and in that, sleeping apartments, besides every other convenience required by the traveller, is provided. Between all these station-houses a line of telegraphs has been established, by means of which the persons in charge of them receive notice of the approach of travellers, for whom they are enabled to provide.

This establishment is necessarily expensive to keep up. Water being a very scarce article in these latitudes, every drop required for the horses and travellers is obliged to be conveyed from the Nile to the various stables and refreshment stations on the backs of camels, together with food and fodder. This renders the journey rather an expensive one; twelve pounds being the fare for each passenger; but that includes provisions. In that inhospitable district, it cannot be expected that accommodations can be very complete either on the road or at the stations. The carriages, in particular, are complained of for the extreme inflexibility of their springs, and the consequent joltings inflicted on the passengers. Consequently this eighty miles is reckoned by far the most fatiguing part of the whole route to India; and many plans have been proposed to obviate it. We have already adverted (at page 94 of our latest volume) to the scheme of cutting a canal across the isthmus of Suez; but attention has since been directed to the formation of a railway between Grand Cairo and the town of Suez. Considered mechanically, few difficulties appear to stand in the way of such an undertaking. Four-fifths of the ground over which the present road passes is firm and solid, whilst the other fifth would require but little engineering to adapt it for the successful laying of rails. Difficulties, however, more formidable than those opposed by nature stand in the way of the enterprise. Foreign states look with a jealous eye upon the scheme, seeing in it a supposed desire of our country to acquire the sole means of overland transit to the East. A French newspaper now before us regards it as a sort of attempted invasion, and declares in all seriousness that England has changed her mode of conquest; that she has turned her sword into a 'rail,' and intends aggrandizing her power in future by means of locomotives! Alarmed, therefore, by the railway plan, the continental journals are advocating the canal expedition; to be executed, however, 'by all, for all;' that is to say, by a union of the resources and skill of all Europe. We sincerely trust that their proposition may be carried out; for travellers to and from India, whatever be their nation, will care very little by what country the work is performed, so it be done by expediency. For our own part, we should like to see a

canal and a railroad besides, if the transit trade prove sufficient to support both undertakings.

We return from this digression to Suez, whence the mail and passengers are embarked for Bombay. The steam-vessels employed in this service belong to the East India Company. In their way, they call at our newly-acquired territory of Aden to take in coals, arriving in Bombay, on an average, in fifteen days. It occupies seven days more to get to Madras, eight to Pondicherry, and thirteen to Calcutta.

THE ORIGIN OF VARIOUS BOOKS.

THE motives and suggestions for writing books are sometimes as curious and interesting as their contents. Thus, Newton's *Principia* originated in his philosophical contemplations on the fall of an apple. Milton's *Comus* was suggested by the incident of Lady Egerton losing her way in a wood; and his *Paradise Regained* is attributable to his having been asked by Elwood, the quaker, what he could say on that subject. The author of that popular romance, *The Castle of Otranto*, states, in a letter to Mr Cole, now in the British Museum, that it was suggested to him by a dream, in which he thought himself in an ancient castle, and that he saw a gigantic hand in armour on the uppermost banister of the great staircase. We are indebted for a fine ode by Prior to the circumstance of the poet having incurred the writing of it as a punishment from his tutor, for neglecting to be present one morning at chapel service at Westminster.

Gower's *Confessio Amantis* was written at the suggestion of King Richard II., who, accidentally meeting with the poet on the Thames, called him into the royal barge, and requested him 'to booke some new thing.' Perefille's *Life of Henry IV.* was written at the command of Louis XIV., to whom he was preceptor, and contains a better account of the monarch than Daniell's larger history of him. At the age of forty-five, Cowper was induced by Mrs Unwin to begin writing a poem, that lady giving him for a subject *The Progress of Error*, the first important offspring of his muse. Dr Beddoe's curious and privately printed poem, entitled *Alexander's Expedition down the Hydaspes and the Indus to the Ocean*, originated in a conversation at the table of Mr W. Reynolds, in which it was contended that the poetical effusions of Darwin could not be imitated. Dr Beddoe some time after produced the manuscript of the above poem as from his friend Darwin, and completely succeeded in the deception. When Wilkie and Washington Irving were rambling together through the old cities of Spain, the painter urged his companion 'to write something about them, in the Haroun Alraschid style,' with a dash of that Arabian spice which pervades everything Spanish. Irving set about the task with enthusiasm, while lodging with Wilkie in the Alhambra; the result was two volumes of *Tales*.

Lord Monboddo tells us that his work on the *Origin and Progress of Language* was suggested by a perusal of Sagard's extremely rare *Dictionnaire de la Langue Huronne* (Paris, 1632). From this curious book we learn that the language of the Hurons is so defective, that it has neither tense, persons, numbers, nor genders; the deficiency being supplied by accents only, by means of which different significations also are imparted to the same word. There can be no doubt that Sterne derived the idea of his *Tristram Shandy* from a perusal of Bouchet's very rare little volumes, entitled *Les Serres*, 1598, containing many very laughable, and some very serious anecdotes. Sterne's mind seems, however, to have been chiefly impressed with the most ludicrous and extravagant parts of the book. Defoe is supposed to have had the idea of his celebrated novel, *Robinson Crusoe*, suggested to him by reading Captain Rogers's *Account of Alexander Selkirk in Juan Fernandez*, 1718. Hogarth, according to Granger, derived the idea of his *Analysis of Beauty* from Haydock's translation of Lomatus's *Tractate, containing the Artes of Curious Painting, Carving, and Building*, 1598. Milton's *Paradise Lost* seems to have been suggested to him by more than one work, perused during his classical and theological studies. Its origin has been ascribed by one writer to the poet having read Giovanni Battista Andreini's very rare drama, entitled *L'Adamo Sacra Representazione*, Milan, 1633; by another, to his perusal of Jacob von Therramo's *Das Buch Belial*, &c. 1472, a rare folio volume. Dunster, in his treatise on the early reading of Milton, says that the prime

stamina of *Paradise Lost* is to be found in Sylvester's translation of Du Bartas's *Divine Weekes and Workes*, 1633. M. Guisot thinks that our bard's immortal poem was suggested by an attentive perusal of a Latin one on the same subject, written by a French bishop at the beginning of the sixteenth century, and published at the commencement of the sixteenth century, and several passages in which are very similar to some of Milton's. It is said that Milton himself confessed that he owed much of his work to Phineas Fletcher's rare and valuable poem, entitled *Locusts or Apollyonists*, 1627.

Many books have been written for the praiseworthy purpose of appropriating their proceeds to the assistance of distressed persons, and to add to the funds of benevolent institutions. It was for the object of contributing to the fund for the propagation of the gospel in foreign parts that Young wrote his tragedy of *The Brothers*. Marmontel wrote some of his celebrated tales to assist his friend Boissy, then intrusted with the editorship of the well-known journal, *Le Mercure de France*. In order to benefit Gretry, the musical composer, Marmontel worked up several little stories into comic operas, all of which were acted with great success. *The Tribute*, a volume of poems by various living authors, and edited by Lord Northampton, originated from a benevolent wish to appropriate its profits to the assistance of the Rev. C. Smedley, editor of the *Encyclopædia Metropolitana*, who, through hard study, had contracted a severe disorder of the eyes, which disabled him from further literary labour. Dr Johnson wrote his *Rasselas* to enable him to pay the expenses of his mother's funeral. Walter Scott's chief object in publishing *Marmion*, was to procure the necessary funds to relieve his brother from certain difficulties into which he had fallen while practising as a writer to the signet. In a letter to Crabbe, Scott says, 'It is curious enough that you should have republished *The Village* for the purpose of sending your young men to college, and I should have written *The Lay of the Last Minstrel* to buy a new horse for the Volunteer Cavalry.'

FIRST JUDGMENTS ON NEW DISCOVERIES.

However void of practical utility any discovery may at first appear, it is impossible to tell to what important results it may eventually lead. Who could have foreseen an acquaintance with the minutest wonders of the heavens from the child of a spectacle-maker amusing itself with convex glasses—the marvellous results of steam machinery from the steam issuing from a kettle—or the illumination of our towns from burning a piece of coal in the bowl of a tobacco pipe? One ingenious contriver of a steam-ship was advised by a former president of the Royal Society to employ his time on some practicable scheme, and not on a visionary speculation; and thus it is that the suspicion and distrust with which any novelty is commonly received, has tended to damp inquiry and retard science. I have been assured by that eminent geologist, the Rev. W. D. Conybeare, that his early investigation of the more recent strata of this kingdom, and especially of the Portland oolite, &c. was treated as an idle occupation of time, and as leading to no useful purpose; whereas the progress of geology, since that time, has shown that the stability of our great public edifices depends on a proper selection from the rocks best adapted for building; and Mr William Smith, who shared in the obloquy of following such useless pursuits in the infancy of the science, was in his old age employed by government, in conjunction with Mr De la Beche and others, to examine the various strata of the United Kingdom, with a view to selecting the best stone for building the new houses of parliament.—*T. Sopwith on Glaciers in Great Britain*. Leeds: 1842.

TUFT-HUNTERS AT OXFORD.

Now, the dean's father was—I beg his pardon, had been—a linen-draper; neither well educated nor well behaved; in short, an unmitigated linen-draper. Consequently the dean's adoration of the aristocracy was excessive. There are few such thorough tuft-hunters as your genuine Oxford Don; the man who, without family or station in society, often without any further general education and knowledge of the world than is to be found at a country grammar-school, is suddenly, upon the strength of some acquaintance with Latin and Greek, or quite as often from having first seen the light in some fortunately-endowed county, elevated to the dignity of a fellowship, and permitted to take rank with gentlemen. The 'high table' in hall, the

Turkey carpet and violet-cushioned chair in the common room, the obsequious attention of college servants, and the more unwilling 'capping' of the under-graduates, to such a man are real luxuries, and the relish with which he enjoys them is deep and strong. And if he have but the luck to immortalise himself by holding some university office, to strut through his year of misrule as proctor, or even as his humble 'pro,' then does he at once emerge from the obscurity of the family annals a being of a higher sphere. And when there comes up to commemoration a waddling old lady, and two thin sticks of virginity, who horrify the college butler by calling the vice-principal 'Dick,' no wonder that they return to the select society of their native town with an impression, that though Oxford was a very fine place, and they had real champagne, and wax candles, and everything quite genteel, and dear Richard was very kind, still they did think he was grown rather proud, as he never once asked after his old acquaintances the Smiths, and didn't like to be teased about his old flame Mary. No wonder that in the visits, few and far between, which, during the long vacation, the pompous B.D. pays to his humble relations in the country (when he has exhausted the invitations and the patience of his more aristocratic friends), they do not find a trace remaining of the vulgar boy who, some twelve years ago, quitted the seat of the provincial muses to push his fortunes in the university of Oxford.—*Blackwood's Magazine*. [This is a sad picture of character; but can we expect linen-drapers' sons to be quite exempt from such foibles while there is such a thing as rank to exercise its peculiar influence over them? It seems to us that rank is everywhere worshipped in this manner in England, precisely in proportion to the immediateness of its presence. Linen-drapers' sons at Oxford must, we should think, be so peculiarly exposed, that their escape is not to be expected. Satire and ridicule are useful, but they should be rightly directed. Here, we think, the direction is wrong, the persons ridiculed being only the victims of a system against which not a word is said. And we often hear persons of rank praised for their apparent indifference on the subject—so different from the fussy veneration paid to it by *parvenus*. How absurd! It would only be surprising if men were to appear anxious about what all the ordinary world is so prone to acknowledge.]

ELIZABETH AND VICTORIA.

People seem to think it flattering to the young Victoria to be likened to the ancient Elizabeth; but it is by no means so certain that the advantage was so far on the side of the Virgin Monarch. The illustrious old lady could talk Latin, but it was confessedly 'rusty'; her taste was so low in some things, that she could not comprehend shadow in pictures: her dancing must have been ludicrous gymnastics: she was a musician—such as virginals could form: she ever hankered after what she had not the courage to take to herself—a husband: and she died in a thicket of self-disappointment and remorse, 'no sons of hers succeeding.' Victoria is an artist, an accomplished musician, a happy wife, a proud mother. If the statesmen and authors of Elizabeth's time were greater, Victoria's country is greater a hundredfold—her possessions outrun the dreams of Elizabeth. The youthful queen may feel a satisfaction in historical associations, but there is little flattery in the comparison. Shakespeare graced Elizabeth's day, but Victoria's day is more worthy of Shakespeare.—*Spectator*.

GENIUS.

It is interesting to notice how some minds seem almost to create themselves, springing up under every disadvantage, and working their solitary but irresistible way through a thousand obstacles. Nature seems to delight in disappointing the assiduousities of art, with which it would rear dulness to maturity; and to glory in the vigour and luxuriance of her chance productions. She scatters the seeds of genius to the winds, and though some may perish among the stony places of the world, and some may be choked by the thorns and brambles of early adversity, yet others will now and then strike root even in the clefts of the rock, struggle bravely up into sunshine, and spread over their sterile birthplace all the beauties of vegetation.—*Irring*.

CHAMBERS' EDINBURGH JOURNAL

No. 56. NEW SERIES.

SATURDAY, JANUARY 25, 1845.

PRICE 1½d.

ANTAGONISM

Few seem to be aware, or if aware, seem to estimate how much mankind are swayed by feelings of opposition or antagonism. I do not allude to that petty querulousness and obstinacy of temper which delight in keeping their own victim and every one else around them in a state of disquietude and misery; but to that broader principle of resistance in human nature which, when once awakened, gives development to character of a kind often the least expected. Three months ago, John Smith was a plain unnoticed shoemaker, who, had he been let alone, might have cobbled to the end of his being without attracting a glance of notice from any save his customers: but now Mr Smith is chief orator at burgh meetings; his name figures in the newspapers; in fact, he is a martyr to fame; and all this because his antagonism was aroused by the imposition of some local tax, which he has resisted to imprisonment. As with John Smith so with a thousand others; we know nothing of them, hear nothing of them, till they are provoked into notice through the operation of this principle, and then we know them for something very different from what they had heretofore been suspected. Thus antagonism may be the means of developing talents and feelings which hitherto lay dormant; of binding the most heterogeneous dispositions into a compact brotherhood; and of giving birth to opinions which at one time were as much derided and opposed as they are now fondly cherished. Though generally invested with the attributes of evil, the feeling may nevertheless be employed as an instrument for good; and though commendable actions arising from such a source are apt to be clouded with suspicion, yet the principle might be used with effect in the development of character, when appeals to apparently more amiable feelings would be in vain. Let us take, by way of example, a few of its operations; and if we cannot commend their origin, we shall at least find that other feelings than antagonism not unfrequently reap the merit of their results.

An acquaintance in holy orders was, five years ago, one of the most ordinary members of the brotherhood. There was nothing in his appearance, manners, or ministrations, to attract the notice of any one; or, if notice was accidentally drawn towards him, it was merely to mark how unremarkable he was, and then to forget him. Now, this individual is one of the most eloquent, active, and energetic members of the church; and this all from being, on one occasion, and in the ordinary course of business, placed in opposition to a fellow-member with whom he was not, in private, on the best of terms. Had it not been for this incident, he might have slumbered on to the end of his days in his quiet, commonplace obscurity. Hitherto, he may have

done his duty; but that consisted in a negative observance of what he ought not to do, rather than in a positive fulfilment of what was required. Something seemed wanting to stimulate him to exertion, and induce him to apply the talent that was in him; in fact, his mind could only be stirred up through the medium of antagonism; hence the result. Nor was this new development of character merely temporary; for it has long survived the feeling that gave rise to it, seemingly sustained by love of approbation, or some other equally powerful incentive. It might be more charitable in such a case as this, to ascribe the change to 'awakened sense of duty,' or some other equally amiable cause; but the truth is, antagonism was directly and perceptibly the impelling principle. The propensity may have more commendable counterparts; but why should a feeling, which has been given us to resist unwarrantable encroachments, when kept within its proper limits, not receive the credit which is due to it?

Take another case. A landed proprietor living in all the ease and unexcitement of the country, and in absolute horror of anything like social or political change, all at once becomes a public orator and reforming patriot. From the blissful ignorance of everything relating to public life, he plunges at once into its vortex; advocates changes which he lately deprecated; and familiarly associates with those who, but a few years ago, were severed from him by an ocean of antipathies. And why all this change? Simply because his lordly neighbour on the other side of the river, and who takes quite an opposite course, has managed by certain acts to excite his antagonism. What arose from the smallest of beginnings was nursed to its present strength partly by popular applause, and partly by the opposition which was offered by his original opponent. As he proceeded, his knowledge of men and things increased; he saw the world in a different light from that in which he was accustomed to view it; and now, when every source of antagonism is removed and forgotten, the ideas which were implanted during its operation continue to be the governing principles of his life. As with this individual, so with thousands; it is not love of popular applause, nor is it patriotism, nor hatred of oppression, which gives the impetus to their public career. The prime mover is antagonism—an opposition to men around them. Ten to one they have been compelled to resist, and, resisting, have felt their own power: gratified by their success, and stimulated by the approbation of others, they hold on in their new course; and when all these incentives have died away, they persevere merely because habit has created for their feelings a channel, removal from which would be to them absolute misery. When the world ascribes the conduct of such men to antagonism, it is at once right and wrong—right in as far as the origin of the change is concerned, but wrong in sup-

posing that mere combative feelings continue to sustain them in their career. And when, on the other hand, it lauds the whole as 'patriotism' and 'innate love of justice,' it is equally mistaken; though, to be sure, it errs in a charitable direction. The beginning of such changes is in many cases as I have recorded; the after-growth is nurtured by different feelings, and ought to be estimated accordingly.

Again; let us take an individual who, up to a certain period, to my knowledge, never did a charitable act, and in whose heart there was apparently as much sympathy for the distressed as there is in the heart of a brick-bat. This person, through the operation of antagonism, now lavishes hundreds on schemes of charity and benevolence. He who would have grudged a five-penny loaf to keep a poor decayed brother from starvation, will now more readily write down fifty pounds, and rejoice in the deed. Nor has vanity or love of display anything to do with such acts; for no one could be more insensible to these feelings than the individual alluded to. Antagonism alone is at the root of the matter, produced and sustained by some peculiar notions respecting poor-laws and poor-law discipline, when these came to be locally agitated. Some may question the benevolence which proceeds from such a source, and, for my own part, I can scarcely commend it; all that I do is merely to exhibit the influence which antagonism so frequently exercises on human conduct. However stimulated into activity, the act of charity, long practised, must, like all other acts, in time become a habit, and then continue to diffuse blessings around it long after every trace of its questionable origin has been obliterated. Indeed it would scarcely do to analyse upon this principle even many of the best of human actions; or if we were, ten to one we should find that few could boast of that ideal purity demanded by the moralist. A little of pride, or vanity, or love of approbation, or spite, or antagonism, mingles too frequently with our better intentions; and perhaps necessarily so; for man, it seems, is so constituted, that he is impelled more by direct incentives than by the result of abstract reflections.

Such are some of the greater workings of antagonism; but there are a thousand cases where it shows itself in provoking and malicious littleness. The petty critic, who sees nothing but barrenness and blunder in every page that does not emanate from his own pen, is not more disagreeable than contemptible. When Mrs Smith subscribes five guineas more than her husband's means will allow to the Blanket Society, merely 'to spite' Mrs Brown—with whom she has waged warfare for the last six years in the field of millinery—then Mrs Smith does an act equally silly and sinful. Or when Mrs Jones, who has really a handsome income at her command, dresses her daughters in druggut, because the Pantons over the way, who are miserably poor, affect the most expensive finery, then Mrs Jones does what is very foolish, and at the same time commits an injury on her children. A man may not be always sunny and cheerful in society; but when he argues with one, dissents from another, and does the very reverse of other men, merely from the impulses of antagonism, then he renders himself not only disagreeable, but is guilty of an unwarrantable infringement on the happiness of others. Again, when a person who held a certain opinion yesterday controverts it to-day, merely because he has learned that his rival entertains the same sentiment, then does that individual not only falsify himself, but weaken the reverence for truth among those who, by their relations, may depend on him for moral guidance. Or when antagonism prevents a native of one country from seeing anything of virtue, or talent, or bravery in the natives of that which is separated from his own by the mere breadth of a streamlet, and urges him to treat them in a derisive and derogatory spirit, then does that man, notwithstanding all his wit and illustration, nay, notwithstanding what may be true in his remarks, demean himself from the standard of sense and

perception to the pettiness of illiberalism and prejudice. Such ebullitions of antagonism are unworthy and hateful, and differ widely from that broader principle of resistance which has been alluded to as frequently giving development to human character in new and valuable directions, and which might therefore be employed as a corrective, while other more commendable methods prove unavailing.

Be this as it may, no one, I think, will deny that antagonism operates powerfully in swaying mankind; and that changes in disposition and character, often ascribed to other causes, are its direct and immediate results. It is well to know this fact, and award to it its proper value in our estimation of conduct. If we are endowed with combative or resistive faculties to ward off unwarranted encroachments, and if we employ these in praiseworthy emulation with others, why may we not, within proper limits, allow them to have a share in the direction of general conduct, and in the formation of character? The philosophy that would exclude such inferior feelings, as they are called, from the direction of conduct, is about as wise as that economy which would exclude fire from the purposes of life, merely because, when not properly regulated, it is a dangerous and destructive element.

THE ROSE.

Among flowering plants, the rose is a universal favourite; the ornament and charm both of the palace and cottage. It is symbolical of love, and beauty, and innocence, and has furnished lovers and poets with more comparisons and imagery than all other flowers taken together. For unknown ages it has been admired, sung of, and cultivated in Europe and Asia; nor does time seem to weaken man's love for his favourite, or to lessen his devices for rearing it in perfection. It may interest the reader, therefore, to know something of the history and properties of the rose, and to learn the origin of some of those allusions to it with which our literature abounds.

Botanically, the rose is the type of the large natural order *Rosaceæ*, which embraces all those plants that more or less agree with the common wild rose in the construction of their flowers. By this test the reader will discover a very striking resemblance between the flower of the wild rose and those of the hawthorn, bramble, raspberry, mountain ash, apple, pear, plum, peach, cherry, &c. all of which are of course included under this order. It is evident, however, that very marked differences exist not only between the fruits, leaves, and stems of these plants, but also between their habits and properties; and therefore, for the purposes of detail, botanists have found it necessary to subdivide the order into six tribes. The first or typical tribe comprehends the *Rosaceæ*, or roses proper, all less or more esteemed for the beauty and fragrance of their flowers, which have originally only five slightly-indented petals, of a red, white, or yellow colour, with numerous yellow anthered stamens; but which, by culture, can be made to assume a mixture of colours, and to repeat their petals a hundredfold. The fruit of the rose is a hip, or false pericarp, enclosing numerous bony carpels, each enveloped in a hairy covering. The leaves are pinnate, consisting of two or more leaflets, and ending with an odd one; each set being furnished with very large stipules. The stems have numerous prickles, which differ from thorns in being articulated; that is, they may be taken off the stem on which they grow, only leaving the scar or mark of their articulation. The leaves of some of the species, as the sweetbrier, are replete with small glands filled with a fragrant oil, which is always less or more evaporating; hence their delightful perfume. By rubbing such leaves between the fingers, the thin cuticle which covers the glands is broken, the fluid escapes more copiously, and the fragrance is increased.

Until the beginning of the present century, few sorts

of roses appear to have been cultivated in Europe; but since then, a great number of beautiful varieties have been raised from seed on the continent, chiefly in France. Upwards of 300 new varieties have been raised in Britain, principally from the Scotch rose (*R. spinosissima*), thus swelling up the gardener's catalogue to upwards of 1000 names. Many individuals in this vast catalogue so nearly resemble each other, that they can scarcely be considered as distinct varieties, but as merely exhibiting temporary and accidental variations, according to the situation, soil, &c. in which they are grown. This is particularly the case with many of the French roses; and the best judges have come to the conclusion that there do not exist many more than 500 distinct varieties of the genus Rose. Whatever the number of varieties, it is clear that none save a professed botanist can hope ever to remember them all; and therefore, for the purposes of ordinary readers, it is best to arrange them into divisions according to their natural habits. By doing so, five groups comprehend the whole, which then become more easily treated, both in point of science and culture. The first group embraces all those which, like the Scotch rose, have slender shoots, small and numerous thorns, and fibrous roots spreading near the surface of the ground, and which naturally grow on heaths and other shallow soils. Being generally surrounded by plants of a low stature, they are much exposed to the browsing of cattle, and have therefore the power of speedily renewing themselves by the creeping nature of their roots. The second group are those which, like the French and cabbage roses, are strong-growing perennial plants, though somewhat shallow-rooted like the preceding. They furnish us with the most beautiful in the flower garden, and seem in their native habitats to be continually shifting their places by sending out suckers, which in turn grow up into new plants at the expense of the original tree, which becomes exhausted and decays. The third, those which, like the common dog-rose, are strong deep-rooted plants, growing naturally among other shrubs and trees, and therefore more elevated in their growth, and taking worse with artificial pruning and training than any other sort. The fourth division comprehends those which, like the evergreen-rose, naturally trail along the ground, or support themselves by bushes growing near them. Under culture they require to be trained along a wall or trellis, and do not, like the three preceding groups, grow up into independent tree-like shrubs. The fifth group includes our monthly, China, and dwarf roses. 'The sudden and rapid way,' says a writer in the Magazine of Botany, 'in which these roses send forth their shoots immediately on a change from cold to heat, points them out as growing in their wild state on mountains covered with snow a part of the year, and, like other natives of such places, with rapidity taking advantage of an interval of warmth to grow, bloom, and ripen their seeds.' Under culture they are generally grown in pots or trained against sheltered walls. It will be seen that though this arrangement has little to do with specific nomenclature, it is sufficiently distinctive to render the habits and characters of the different roses perfectly intelligible.

The rose, in a wild state, always exhibits single flowers in the north of Europe; but in the southern parts, particularly Italy, Greece, and Spain, it is not uncommon to find roses with double flowers growing spontaneously in the fields and woods. It is to culture, however, and to the devices of the gardener, that we owe our present stock of exuberant and variegated specimens; and this brings us to speak of the history of the rose, which we shall principally glean from the recorded account in London's Arboretum. The rose is mentioned by the earliest writers of antiquity as an object of culture. Herodotus speaks of the double rose, and Solomon of the rose of Sharon, and of the plantations of roses at Jericho. Theophrastus tells us that the hundred-leaved rose grew in his time on Mount Parnassus; and it appears that the Isle of Rhodes (Isle

of Roses) received its name from the culture of roses carried on there. Pliny mentions several sorts of roses which were known to the Romans, and which modern authors consider as the same with the Damascus, French, and cabbage roses. The ancients do not appear to have known either the yellow or the white rose, unless we except those which Pliny calls the roses of Alabanda, in Caria, which had the petals whitish. Roses were more highly prized than any other flowers by the Romans, who had even attained the luxury of forcing them. Under the reign of Domitian, the Egyptians thought of offering to the emperor's court, as a magnificent present, roses in winter; but this the Romans smiled at, so abundant were roses in Rome at that season. In every street, says Martial, the odour of spring is breathed, and garlands of flowers, freshly gathered, are displayed. 'Send us corn, Egyptians, and we will send you roses.' Roses were employed, both by the Greeks and Romans, to decorate tombs; and instances are given of rose-gardens being bequeathed by their proprietors, for the purpose of furnishing flowers to cover their graves.

Of the history of the rose from the time of the Romans till the days of Tournefort, when botany became a science, very little is known; but there can be no doubt that, in the dark ages, they were held in esteem by all who could procure them. When Saladin took Jerusalem in 1128, he would not enter the shrine of the temple, then converted into a church by the Christians, till the walls had been thoroughly washed and purified with rose-water. Voltaire says, that, after the taking of Constantinople by Mahomet II. in 1453, the church of Sophia was washed with rose-water in a similar manner before it was converted into a mosque. We read in the 'History of the Mogul Empire,' by Father Catron, that the celebrated Princess Nourmahal filled an entire canal with rose-water, upon which she was in the habit of sailing with the Great Mogul. The heat of the sun disengaged the essential oil from the rose-water: this was observed floating upon the surface; and thus was made the discovery of the essence, otto, or attar of roses. In 1503 Ludovico Verthema, who had travelled in the East, observes that Taessa was particularly celebrated for roses, and that he saw a great quantity of these flowers at Calicut. Sir John Chardin, in 1686, found the gardens of the Persians filled with roses: and all modern travellers bear testimony of the esteem in which the flower is held in Persia, Syria, and Egypt. Sir W. Ouseley says that he was perfectly overwhelmed with roses in the garden of the castle of Fassa; Jackson speaks of mattresses being made of the roses of the Nile for men of rank to recline on; and Buckingham mentions the rose plantations of Syria as occupying many acres in extent. At marriages and other festivities in the middle ages, the guests were adorned with this flower; and it was customary to carry large vessels of rose-water to baptisms. Indeed, the fondness of our ancestors for this fragrant and elegant flower, explains the feudal custom of vassals being required to pay so many bushels of roses to their lords.

In Britain one of the earliest notices of the rose occurs in Chaucer, who wrote early in the thirteenth century; and in the beginning of the fifteenth century, there is evidence of the rose having been cultivated for commercial purposes, and of the water distilled from it being used to give a flavour to a variety of dishes, and to wash the hands at meals—a custom still preserved in some of our colleges, and also in many of the public halls within the city of London. Among the New-Year's gifts presented to Queen Mary in 1556, was 'a bottle of rose-water;' and among the items of a dinner of Lord Leicester, when he was chancellor of Oxford university, in 1570, is mentioned three ounces of the same liquid. In 1576 the tenant of Ely House covenanted to pay the bishop on midsummer day a red rose for the gate-house and garden; and for the ground (fourteen acres) ten loads of hay, and £10 per annum; the bishop reserving to himself and successors free ac-

cess through the gate-house, for walking in the gardens and gathering twenty bushels of roses yearly. Gerard, in 1597, speaks of the damask-rose, and the cinnamon-rose, as common in English gardens; but as roses in the middle ages were used in the festivals of the church, it is likely that they were generally introduced into the gardens of priories and abbeys long before Gerard's time. The musk-rose is said to have been brought from Italy into England in 1592, the single yellow rose from Syria in 1629, and the moss-rose from Holland early in the eighteenth century. One of the most valuable roses, the China rose, was introduced in 1789; and it may be said to have created a revolution in the culture of roses, by the innumerable varieties which have been raised between it and the European roses.

The great use of the cultivated rose, in all countries where it is grown, is as a floriferous shrub; but it is nevertheless cultivated for the uses to which its flowers are applied in medicine and domestic economy in different parts of Europe, in the north of Africa, and more especially in Asia. In Syria it has been cultivated from time immemorial; and indeed the aboriginal name of that country, *Suristan*, is said to signify the land of roses. The rose plantations of Damascus, those of Cashmere, of the Barbary coast, and of Fayoum in Upper Egypt, are cultivated solely for the making of the attar, or essence of roses. In France, the rose de Provins is extensively cultivated in the neighbourhood of the town of that name, about sixty miles south-east of Paris, and also at Fontenay aux Roses, for products of a similar nature. In Britain, in the neighbourhood of London, Edinburgh, and other large towns, and in many private gardens, the flowers are gathered for making rose-water, or drying as perfumes. The various preparations from the flowers are the preserved petals, rose-water, vinegar of roses, spirit of roses, conserve of roses, honey of roses, oil of roses, and attar or otto of roses. In Syria the natives sometimes convert the leaves and flowers into cakes and tarts—the latter, according to modern British travellers, are very delicious; and at Damascus, the young shoots of the rose-trees are gathered and eaten as vegetables. There are other minor uses to which the flowers and leaves of the rose are applied, such as the communicating flavour to wines, &c. but to these we need not further advert.

The poetical, mythological, and legendary allusions to the rose are exceedingly numerous in every country in which it is known. It was dedicated by the Greeks to Aurora as an emblem of youth, from its freshness and reviving fragrance; to Venus as an emblem of love, and beauty, from the elegance of its flowers; and to Cupid as an emblem of fugacity and danger, from the fleeting nature of its charms, and the wounds inflicted by its thorns. Anacreon makes its birth coeval with those of Venus and Minerva:—

Then, then, in strange eventful hour,
The earth produced an infant flower,
Which sprang with blushing tinctures drest,
And wanted o'er its parent breast.
The gods beheld this brilliant birth,
And hailed the rose—the boon of earth.

A beetle is often represented on antique gems as expiring surrounded by roses; and this is supposed to be an emblem of a man enervated by luxury—the beetle being said to have such an antipathy to roses, that the smell of them will cause its death. The Romans, like the Greeks, were also excessively fond of roses; and, while they adopted the same legends, they made use of the flowers in a more practical manner. At feasts they garnished their dishes with them, floated them in their Falernian wine, perfumed their baths with rose-water, sculptured wreaths of them on the shields of their victorious generals, and strewed them on the tombs of their departed friends. In the East the rose has always been a favourite with the poets, and volumes of fable and allusion might be gathered from their works. The most beautiful, undoubtedly, is that of the nightingale and rose, in which the former is represented as wooing his favourite flower by his inimitable song.

The rose was also celebrated in the Catholic church. A golden rose was considered so honourable a present, that none but crowned heads were thought worthy either to give or to receive it. Roses of this kind were sometimes consecrated on Good Friday, and given to such potentates as it was desirable to conciliate. The custom of blessing the rose is still preserved in Rome, and the day in which the ceremony is performed is called *Dominica in Rosâ*. The rose was always considered as a mystical emblem by the church; and, as Schlegel observes, it enters into the composition of all the ornaments of Catholic churches in combination with the cross. The rosary used in devotional exercise is generally made of beads, manufactured in the following manner. Rose leaves contain certain acids which act on iron, and advantage is taken of this property by beating the petals of the flowers with cloves and other spices in an iron mortar, till a thick black paste is formed, which hardens on exposure to the air, and is then polished or turned, so as to form the perfumed beads of the rosary. In 530 St Médard, bishop of Noyon, instituted a festival at Salency for adjudging annually the prize of a crown of roses to the girl who should be acknowledged by all her competitors to be the most amiable, modest, and dutiful in the village. This custom was continued to the time of Madame de Genlis, who has written a beautiful little drama, entitled *La Rosière de Salency*, on the subject. In the middle ages, the knights at a tournament wore a rose embroidered on their sleeves, as an emblem that gentleness should accompany courage, and that beauty was the reward of valour. The French parliament had formerly a day of ceremony called *Baillie de Roses*, because a great quantity of roses were then distributed, or rather because the nobles were then accustomed to receive from their vassals their annual tribute of roses, and then to interchange and make presents of them to one another.

The rose is the national badge of England; but the origin of its assumption is not explained by any of our antiquaries. Shakspeare, who no doubt followed some old legend or chronicle, derives the assumption of the red and white roses by the rival houses of York and Lancaster from a quarrel in the Temple gardens between Richard Plantagenet, Duke of York, and the Earl of Somerset, the partisan of Henry of Lancaster. Finding that their voices were getting too loud, Plantagenet proposes that they shall

In dumb significance proclaim their thoughts;
adding—

Let him who is a true born gentleman,
And stands upon the honour of his birth,
If he supposes I have pleaded truth,
From off this brier pluck a white rose with me.

To which Somerset replies—

Let him who is no coward, nor no flatterer,
But dare maintain the party of the truth,
Pluck a red rose from off this thorn with me.

Their respective followers gathered the different-coloured roses; hence tradition says these flowers were adopted as the badges of the houses of York and Lancaster. Camden assigns a different and earlier origin to these badges; namely, that as it was then customary to assume badges, Edmund Crouchback and Edmund of Langley respectively assumed the red and white roses as theirs, not from any hostile feeling, but as mere marks of distinction. Be this as it may, the red and white roses were subsequently employed as Shakspeare relates; and the York and Lancaster rose, which has one-half of the flower red and the other white, was named in commemoration of the union of the two houses by the marriage of Henry VII. of Lancaster with Elizabeth of York.

'The expression "under the rose" took its origin,' says Jenoway, 'from the wars between the houses of York and Lancaster. The parties respectively swore by the red or the white rose; and these opposite emblems were displayed as the signs of two taverns, one of which was by the side of, and the other opposite to, the parlia-

ment house in Old Palace Yard, Westminster. Here the retainers and servants of the noblemen attached to the Duke of York and Henry VI. used to meet. Here also, as disturbances were frequent, measures either of defence or annoyance were taken, and every transaction was said to be done *under the rose*; by which expression the most profound secrecy was implied.* According to others, this term originated in the fable of Cupid giving the rose to Harpocrates, the god of silence, as a bribe to prevent him from betraying the amours of Venus, and was hence adopted as the emblem of silence. The rose was for this reason frequently sculptured on the ceilings of drinking and feasting rooms, as a warning to the guests that what was said in moments of conviviality should not be repeated; from which what was intended to be kept secret was said to be held 'under the rose.'

THE ROCK FAMILY; OR A NIGHT'S SPORT IN TEXAS.*

BY PERCY B. ST JOHN.

'Down jib, Mr Goodall; stand by your main and fore-sheets; look out for a jibe; hard-a-lee; let go your sheets; unspreet the sails!—such were my orders to my crew, composed of two old men-of-war-men, a pert young midshipman, and our captain's clerk, as, one beautiful afternoon last spring, we reached a halting-place on Dickenson's bayou. These orders having been obeyed, my cutter glided gently into a little indentation under the bank of one of those numerous and singular streams which intersect in every direction the prairie and woods of Texas, and which give promise, when its day has come, of great facilities of commerce to the young republic.

We had halted at a house some twenty miles from any other habitation, not so much to seek shelter for the night, for any dry spot would have served our purpose, as to become acquainted with the inmates of this dwelling, concerning whom I had heard a great deal. Before, however, we walk up to the mansion, let us observe its position, and give the reader some idea of the domain of a family of leatherstockings. About twelve miles from the mouth of the river, which pursued its winding course up to this spot uninterruptedly through the bare prairie—not a tree, not a bush checking the wind, the tall brown grass alone occupying its banks—the forest began to make its appearance; and here was situated the house of the settlers. The stream was here about twenty yards wide, with scarcely any perceptible current, or, if any showed itself, it was up the bayou, as the tide had been coming in the whole afternoon. The banks of the river were in no place two feet above the level of the water, and even when standing upright on the thwarts, the prairie on both sides was so flat as to appear to descend and gain a level far inferior to that of the water, so smooth, unbroken, and sea-like was the surface of the savannah. Higher up, the bank became more bluff, and was soon thickly skirted with trees of various descriptions, so as to be rendered certainly more picturesque, but perhaps less grand, than the endless plains below.

The house was built upon an eminence, rising gradually from the little harbour to the height of about seven or eight feet, and covered in all parts by short stunted grass. It was the most solitary, wild, and unpromising location of all the many unpromising spots which I had yet seen within the confines of Texas, and this is saying not a little. There was a frame-house, with veranda in front, the whole built upon piles, of elegant design, and which doubtless had once looked very social and pleasant; but, alas! what a falling off was here! The structure, as well as the numerous out-

houses and sheds for negroes, had evidently been erected several years before by some rich settler; but now the roof was falling in; the planks which formed the walls were in many places torn down; while weeds and herbage grew around the door. Not a domestic animal was to be seen, not even the universal pig; and I began to wonder what could induce any civilised person to dwell in so extraordinary a place. My curiosity had been long excited with regard to its inmates, and what I saw was not likely to decrease it.

Our approach, as I afterwards learned, had been for some time noticed; which was not to be wondered at, since the front of the house faced the wide plain across which we appeared to have been sailing, a man-of-war's pennant at our peak, and the Texan ensign at the mast-head. So winding was the course of the river, it was not surprising that we had been for more than an hour in sight of the house. We had, therefore, scarcely entered the creek, when there issued from the door the gaunt figure of an aged man, some six feet high, habited in buckskin trousers, moccasins, a huge thick blanket-coat, and the never-failing American rifle on his shoulder. Having taken a very quiet survey of us from the veranda, he advanced towards the water's edge, where we were busily engaged stowing our sails, and putting our craft in order.

'How does it progress with you, Mr Rock?' said Mr Midshipman Goodall, who had seen him before; 'I guess you're well? You'll reckon we're up here hunting, and you won't be much out; we intend camping in the dry timber to-morrow; but we've progressed pretty considerable to-day, I reckon, and we'd better stop here to-night. So Mr — had agreed to it.'

'Mr — is welcome,' replied Mr Rock, turning to me, and raising his antiquated beaver. 'Whatever accommodation we have is at your service; for, I say, captain, it's God's truth we don't often have our threshold darkened by a stranger; no, by St Patrick.'

Oh, oh, sweet Tipperary, thought I, how are you? Here was a surprise. Some ten thousand miles from the green isle, in a wild uncivilised district but a few years back inhabited solely by the wolf, the deer, the panther, or perhaps the red man, I had arrived at a house, expecting to encounter at all events some huge Kentuckian or Virginian hunter; but no—Paddy all the world over.

'I reckon you don't see such strangers every day?' replied Goodall, ere I could open my mouth; 'strangers with a considerable supply of 'bacca and satchle flip: if we don't slant your perpendicular, it's a caution, Mr Rock.'

'Mr Goodall is right,' said I, leaping ashore, and addressing the old man, whose eyes glistened at the unwonted intelligence; 'we have some brandy and tobacco at your service; but I am sure this will not be required to induce you to give hospitality to one from the old country?'

This time the old man's eye grew dim, as, seizing my hand, and almost crushing it in his iron grasp, he exclaimed—'Welcome to Texas, welcome; it is long since I have seen one direct from home.'

'Oh,' I continued, calling the captain's clerk to me, 'here is Mr Doyle, a countryman in earnest, while I am an Englishman.'

'I know him, sir,' replied Captain Rock, his popular name; 'but, excuse me, you have not long been in the navy?'

'A very short time.'

'But I am keeping you standing, Mr —; perhaps you will come up to the house, such as it is.'

Shouldering my gun, and having furnished my pockets with a bottle and tobacco, I followed Rock up to the house, where I was introduced to the whole of the family, with the exception of Jim Rock, who was out hunting. By this occupation the industrious young leatherstocking almost wholly supported the family. By constant practice, as well as by the force of necessity, he had become a dead shot, invariably bringing in a

* In the Journal No. 13, new series, I gave some account of the Rock family, under the title of 'The Wedding.' Considerable curiosity having been excited by the facts narrated in connexion with these backwood settlers, I have examined my journal, and now extract my first impressions in regard to those personages.

buck, a doe, or half-a-dozen brace of ducks. The apartment in which we were received by the rest of the family was unique. It had been once carefully boarded; but, with an economy peculiar to backwoodsmen, the planks had been torn down for firewood, and their place supplied with deer-skins, which hung over the apertures. In one corner of the room stood a raised platform, which we afterwards found to be a bed; in the centre was an old iron cauldron suspended from the roof over a fire of chips of greenwood, and attended by Mrs Rock, a quiet reserved little old woman. I was next introduced to the daughters, Miss Mary and Miss Betty, of whom I almost despair of giving a faithful delineation. Mary was nineteen, and Betty twenty-one, both as perfect specimens of Dutch Venuses as ever emanated from the fertile pencils of Rubens or Houdekoetter, with cheeks of that rosy hue, —

'Whose blush would thaw the consecrated snow
On Dian's lap.'

Never in the whole course of my existence, in my European or transatlantic peregrinations, had I seen females at their age so inordinately large. Their faces were perfect full moons, round, fat, with sparkling blue eyes, pert noses, and well-shaped mouths. Their forms were, I have said, huge, but were not misshapen, speaking volumes for the salubrity of the wilderness around them, and the wild fare of a Texan prairie. Their dress was original. Covering for their heads they had none; but their bust was cased in a coarsely-made body of deer-skin, lacing in front, and disclosing an under-garment of red flannel. Their petticoats were of blanket stuff, and composed of so many pieces, that my arithmetic fairly shrunk from the enumeration. They wore gaiters and moccasins; and were, in fact, altogether the most original pair I had ever beheld.

They were 'young, fresh, loved, though scarcely delicate; yet two more delightful girls I never met. Ignorant they certainly were, but it was pure, simple, unsophisticated ignorance; that is to say, they could not read, they could not write, they knew absolutely nothing of civilised life. How should they have done so? They had entered Texas with the first colonists under General Austin in the year 1832, and before that, had been vegetating at the foot of the Alleghany mountains. But then they could hunt, fish, and row an oar; they could tell you all about the neighbourhood, its characteristics, its beauties; they were true children of nature; and never having associated with low or vulgar persons, they were neither low nor vulgar themselves; and then their father and mother had seen better days, were very correct in their mode of speaking, and the children followed them. Betty, I soon found, was engaged to a neighbour (living some thirty miles off) named Luke, and accordingly Mary, by an inexplicable law of nature, became my favourite. But I soon won the good graces of both, especially when I set to work with great gusto to aid them in preparing our evening meal. It was varied in character. I provided beef, biscuit, and coffee, besides a supply of fine oysters, taken in at the mouth of the river; they brought forth Indian corn cakes, hot and tempting, deer's meat, salt and fresh, and a pumpkin pie. A Yankee would have luxuriated upon this last delicacy, taken from a very paradise of pumpkins about half a mile from the house, and which in itself was a curiosity, so numerous and large was the produce. A field once planted with this vegetable, seldom needs planting again; the scattered seeds sow themselves, and the plants are cultivated with the corn; they often reach so large a growth, that one is as much as a man can lift, and have a sweet and very palatable flavour.

Supper concluded, we took to coffee and pipes, and the conversation turned upon various matters. Among other-topics which were brought upon the *tapis*, or rather upon the mud floor, old Rock alluded to an island formed by the river branching off into two streams, and meeting again about a mile below, which was much frequented by aquatic birds, as also by mustangs or wild

horses; of the latter, however, I was told but a few remained.

'I should like very much to spend a few hours upon this island, Mr Rock, as my principal object in visiting this part of the country is to see all its peculiarities.'

'And why not go at once?' said Mary, starting from her seat on a huge pine log; 'by moonlight is the time to see the horses, and then on our way back we may perhaps catch a red fish.'

'You are right, Mary,' said Captain Rock, 'and it is a great pity Jim is from home, who knows every hole and corner; but you two girls can go and show it to Mr —; that is, if you, sir, are not too fatigued?'

I protested of course against any such supposition, and accordingly rose for the purpose of starting immediately. I summoned Mr Goodall and Mr Doyle to accompany me; but as I saw they were not disposed to 'dare the vile contagion of the night,' and appeared to prefer coffee and tobacco to moonlight and romance, I did not insist; especially knowing that a pert young Yankee midshipman, even though with his superior officer, was not likely to enhance the pleasure of the expedition. My fair companions took each a fowling-piece, and also some fishing-tackle, and trotted down to the water's edge, whither I followed them. The very sound of their merry clear voices, as they laughingly essayed to trip down the path—a very unsuccessful attempt—was enough to cheer the spirits and encourage one to proceed. I found, on reaching the bank, that the young ladies intended making the voyage in an Indian canoe, which occasioned in me some qualms of conscience, since a piroque is at all times a ticklish concern; but with three persons in it, and two of them no sylphs, it appeared a very serious undertaking. I ventured a very polite observation on the subject, when my companions burst out laughing, and pointed peremptorily to the frail bark.

'Enter, enter,' said Mary, 'or else, taking offence at your very rude insinuation about our weight, we shall give up the journey.'

There was no resisting such an appeal; accordingly I stepped gently into the canoe, and sat down in the middle, 'submitting me unto the perilous night' with a full expectation of being ducked for my temerity. Nor was I without fear for the young ladies themselves, who, in case of a capsize, I dare swear had gone to the bottom before they could have said an *Ave*. Betty sat in the stern, and Mary in the bow, and away we went, the canoe urged along by Betty's paddle, which she managed with much dexterity.

The night was lovely; the moon, lately risen, poured a rich flood of light upon the rippling waters of the river, over which we glided almost noiselessly. Far off on the prairie we could hear the distant howl of the jackal, as, hurrying to some feast, he gave notice of his presence; sometimes a stray duck or goose would go quacking over our heads, or perhaps a buzzard or a sand-hill crane. Having proceeded about a quarter of a mile, during the journey over which we did not spare the jest, a few trees began to border the river's bank, casting their trembling shadows upon us as we passed, and affording a delightful contrast to the sea of molten silver over which we were gliding. The trees gradually becoming more thickly spread, we soon swept along down a gloomy avenue of foliage, which wrapped the river in darkness, and the eye refused to penetrate the depths of the long vista which presented itself to my gaze. Nor was the course of the river entirely free from fallen timber and snags, rendering our progress very cautious and slow, and forcing Miss Mary to keep a sharp look-out. A few minutes again elapsed, after entering within the sombre domains of the 'big timber,' when the canoe glided gently between the overhanging boughs of a thick bush, and presently stood still. We had reached the island, but of course to me it presented the appearance of being the right bank of the river. Mary Rock, having warned me to stoop my head as low as possible,

impelled the canoe forward a few yards more by means of the branches above, and we entered a small creek, before perfectly concealed by the bush we had passed.

Silence was now strongly recommended me by my fair associates, and we left the canoe, taking with us our arms, not without surprise on my part at finding myself in so solitary a spot, from which there appeared no visible means of exit. No sooner, however, did we stand on terra firma, than I was led by a circuitous path through a dense thicket, and thence to the foot of a rising bank, on which stood a grove of lofty pine trees, through which the wind gently murmured, and whose tops were silvered by the light of the moon. Betty whispered me to be very circumspect, and to make no noise, but advance along the grove to the edge of the rising bank, and look out cautiously upon the open but small prairie. She then disappeared most mysteriously in the thicket, leaving Mary to be my guide; and so stealthy was her mode of proceeding, that, though I stood and listened carefully, yet I could not catch a sound of her footsteps. Following Mary with 'solemn steps and slow,' I soon gained the desired spot, where an opportune log being pointed out, I sat down beside my interesting guide, and threw my glances around the little plain. The atmosphere was impregnated with perfumes sweet and exquisite, most refreshing after the tropical heat of the day; in fact, when I gazed upon the scene around me, and gave way to the emotions it created, I thought I had never looked upon anything in the shape of scenery so beautiful, or which more forcibly impressed itself upon my imagination. I was silent during many minutes, having risen from the log and leant myself upon my gun; and, amid the universal stillness, drank my fill of all that was sublime in the time, the place, and the associations it conveyed. Presently, turning to my companion, I thanked her most warmly for the pleasure her considerate kindness had afforded me.

'Nonsense,' said she; then seizing my arm, she added, 'hush, and look yonder!' pointing to an opening in the forest on our left, whence a crowd of animated bodies were moving. Crack went a gun, and the whole group of wild horses—for such they were—came rushing and scampering in our direction across the plain. In number they were about twenty, and led by a beautiful white horse; they pawed the ground as, in long Indian file, they rushed past us, snorting, neighing, furious at being disturbed in their peculiar haunts. I could plainly distinguish them in the brilliant light of the moon, and thought I had never seen anything more admirably proportioned. In fact, if fine delicate heads, wide nostrils, thin tapering and clean limbs, small and hard hoof, and an Arabian symmetry of form, constitute a beautiful horse, there are abundant of beautiful horses in the Texan prairie. Those who judge of these wild animals from the mustangs which are commonly brought to market, are misled if they underrate the animal, since the most inferior are generally caught, while the more noble escape the *lazo*, itself enough to ruin the finest beast.

My gun was levelled at them by a natural instinct as they passed; but it was allowed to remain undischarged, as I reflected how useless, and even sacrilegious a waste of life it would be to bring down one of these noble animals. It was lucky I did so, since a much fitter object for bringing into play the murderous propensities of a Texan novice was at hand: a few minutes after, we heard the loud cry of the caiote in the distance, in chase of some animal, and as the hunt was evidently approaching our way, we prepared ourselves.

'Hush!' said Mary Rock, kneeling down behind a bush, and motioning me to follow her example; 'it is the prairie wolves after a deer; and I am sure the beast will take to the water, and seek refuge on the island, so be perfectly quiet, and we shall perhaps carry home an unexpected prize.'

I did not answer, as the loudly-repeated howl of the vicious animals in chase, the splashing sound of the frightened victim taking to the river, the rush of his

pursuers after him, warned us to be on the alert; and, in another instant, a fine buck flew by us on the plain, at the distance of about fifty yards, followed by some dozen wolves in full chorus. As our various positions allowed us no choice, Mary Rock fired at the deer, I at the wolves, giving them both barrels; which was not their only infliction, since the echoes of my volleys had scarcely died away, and the terrified animals had not gained the wood, when a sheet of flame poured out from an opposite thicket; our Betty's ambuscade sent them back howling toward us. Mary now gave them her remaining barrel, and we rose to follow the buck; he was, it appeared, only wounded, though severely, and we could plainly discern him dragging himself slowly along amid the tall grass.

'Who'll catch him,' said Mary, laughing and pointing to Betty, who was hurrying across the prairie in his direction: 'I really think you mean to let us do every thing to-night.'

I made some gallant reply or other, and loading my gun as I moved along in company with Mary, we soon came up with our prize without being under the necessity of again firing, as the animal was dead ere we reached it. After some little conversation with Betty relative to the scene around, and the effect produced on my mind by the horses, we proceeded to prepare the deer for carrying to the boat; and had severed the head, &c. when the sharp crack of a rifle in the distance startled me.

'Brother Jim, for a dollar,' said Mary laughing; 'he has heard our firing, and will be home, doubtless, before us, unless we make haste.'

Satisfied with this explanation, I continued to assist my female Nimrods in their task, which completed, and a suitable pole being found, I and Betty slung the deer upon it, and raised it on our shoulders, while Mary carried the guns, and led the way to the canoe. Suddenly, as if a brilliant idea had struck me, I halted.

'Miss Rock, you will excuse me,' said I with the utmost gravity of voice and countenance, 'but do you intend adding this unfortunate brute to the former load of the canoe?'

Peals of laughter followed this insinuation concerning the ponderosity of my jocund companions, and we continued our journey to the piroque, not without experiencing considerable difficulty in making our way, loaded as we were, through the thicket above alluded to. Fortunately, neither silks nor satins were here to be destroyed; my companions were no

'Jeunes damoiseaux
Plus emplumés que des oiseaux!'

and it was a matter of very great indifference to them how many rents there were in their petticoats when they returned home, since what easier than to mend them. The canoe gained, a council was held as to our future proceedings. Betty, the *fiancée*, and of course the most prudent of my companions, hinted at a return, but without throwing much warmth into her arguments; and finding that I was not trespassing upon the kindness of my guides, I proposed we should at all events try our luck with the fishing-tackle.

'Certainly,' said Mary, who would hardly let me finish my speech—'certainly, and we are sure to catch some such a night as this. Have you ever tasted any red fish?'

'Never, my charming friend, though I have long desired to do so.'

'Never! then you shall have some for breakfast to-morrow morning, if I stay out all night to catch them. What say you, sister? Besides, you know we don't have such company every day.'

I acknowledged the frank compliment, for such I felt it to be, from this child of nature; and Betty agreeing, we pushed once more into the stream, and paddling gently towards home, put up in a little bight of water half way to Rockville, as the habitation of the family was familiarly called. Three lines were now produced, and the hooks were baited with mullet, with a supply

of which they had provided themselves on leaving home; and standing some ten yards apart upon the bank, we threw in our tackle, and sitting down, awaited with patience the result. It is to me no wonder that angling proves so fascinating an amusement as it is known to be, when it incites us to linger round such exquisite and unrivalled scenery as the teeming rivers of every clime abound in; but though, I confess, I ever loved the sport, and had followed it in less rustic guise on the banks of the Thames, in the Rhone's muddy waters, on Leman's translucent lake, and on the vine-bordered streams of the Cote d'Or, I do not think I ever angled under such romantic influences as crowded upon me on that night.

'I have got one, I have got one,' exclaimed my friend Mary in loud and merry accents, as, running back from the water's edge, she drew on shore a large fish, which splashed the water in its impotent endeavours to escape, and when drawn on terra firma, struggled most furiously to regain its native element. It was a red fish, considerably upwards of twenty pounds; no joke of a fellow for a young lady of nineteen to handle in the manner in which Miss Mary pulled him ashore. She had but just baited her hook a second time, when we were summoned by Betty, this time most anxiously, as she appeared to fear her prize would prove too much for her; and no wonder, for when all three of us laid hold of the cord, which was a treble red fish line, it was with the utmost difficulty our united force could cope with the monster of the deep, which had by some error of judgment, I opine, swallowed our barbed hook. Certainly, be he what he might, he did not like his position, for he darted here and there with furious perseverance; now up, now down, splashing the waters about with his tail, then sinking to the bottom. But despite his angry gambols we were not disposed to let him off, and accordingly held on with might and main; and presently having fastened a stake to the line, and fixed one end in the ground, it was not difficult to prevent his gaining upon us. My curiosity, much excited, and the young ladies protesting their ability to hold on, I went close to the water's edge, and watched the struggles of the furious animal. I could plainly see that in size he was no trifle; he appeared indeed many yards in length, and I verily believe, if the line had broken, I should until this day have imagined it to be a crocodile; but his force was beginning to be expended, blood tinged the clear surface of the waters, and uniting our combined forces, we drew him on shore.

'I thought so,' said Betty pettishly; 'a nasty useless alligator gar.'

Mary laughed outright, and exclaimed against having worked so hard for nothing, while I smiled, but expressed my thanks to Betty for procuring me a sight of a fish I had never before seen. This immediately reconciled the young lady to her capture, though Mary did not spare her jokes for all that. An alligator gar is a huge fish—this was three yards long—with an enormous snout, a back covered with scales, and in fact very similar in general appearance to an alligator, for which it is often mistaken when in the water. Nothing daunted, however, we pursued our sport with various success for another half hour, when the paddles of a canoe, or dug-out, fell on our ears, and presently brother Jim, in the smallest and most elegant Indian canoe I had ever seen, joined us. He was a slim small made lad about sixteen, very quiet and sedate, who expressed no surprise whatever on seeing a stranger, but invited us to return with him. We did so, taking with us our game, to which was now added a doe and fawn, the result of Jim's hunt.

My crew were all sleeping off the whisky, as well as old Rock and his wife, and we did not think fit to disturb their slumbers, but occupied ourselves in preparing some fresh coffee, while Mary broiled some steaks of red fish, which proved as delicious as salmon, though less rich, and we made a most excellent supper, enlivened by the merriest and most delightful conversation. Our meal concluded, my friends, 'fair and fat,' but, united,

only 'forty,' wished me good night, warning me at the same time that they should be up early in the morning to take me to a duck pond about a mile off, and then went to rest. I and Jim, whom I found very intelligent, and quite communicative on such points as he knew anything about, smoked a pipe, drank a tumbler of brandy and water, and then followed the example of those around us.

'Soon as Aurora heaved her orient head
Above the waves that blushed with early red,'

I was on foot, and armed for the conflict, which, though not likely to be dangerous, was yet most likely to be sanguinary. Mary and Betty were again my only companions, since the rest still slept soundly, as I afterwards found, in consequence of heavier potations than they were accustomed to. Our walk was through the savannah. It was not long, or at all events it appeared not so to my merry jocund friends, ere we reached the pond we were in search of, skirted by a few low bushes, which enabled us to take a survey without alarming the wild fowl which covered it. I had long ceased to be astonished at the myriads of ducks, geese, and swans, as well as teal, snipes, &c. which are everywhere, and at all times, to be met with in this country; but still, upon this occasion my surprise was renewed; the pond was literally black with them; and as we shouted and let fly six barrels among the affrighted masses, they appeared a dark cloud obscuring the light of heaven.

'What do you think of that now?' said Mary; 'was it not worth getting up for?'

I protested that the agreeable walk was worth ten early risings, especially when honoured with such company; and compliments being thus passed, we picked up our game, not without considerable laughter from all parties, the Miss Rocks having, to catch their quota, to enter the water until it reached above their knees. The number we collected was nineteen, very respectable materials for a breakfast; an appetite for which meal being by this time obtained, we returned towards the house. On approaching, we observed the whole party, save Mrs Rock, congregated down by the water's edge, and, preparatory to joining them, we entered the house by the back door to deposit our game.

In the apartment in which we had been the previous evening was Mrs Rock, her sleeves tucked up above her elbows, holding in one hand the handle of a frying-pan, which was placed over a hot but slow fire, and with her other, in which a ladle was held, stirring slowly and deliberately the contents of that very useful cooking utensil. She was turned from us, and did not notice our approach, until a loud scream from my fair friends aroused her, as, throwing down their game, guns, everything about them, they scampered off to a respectable distance from the house. What could be the meaning of all this? Were the suspicions which arose in my mind the previous day, and which I had not ventured to put into shape, about to be verified? Had I travelled all this distance to come across, not a Lancashire, but a Texan witch? And what was the result? But Mrs Rock did not leave me long in doubt.

'Retire, sir, for your life; my daughters will explain,' said she, emptying at the same time the contents of the frying-pan into an old newspaper in the corner of the room. What on earth were those round seed-like globules which fell with such clatter on the old *New Orleans Picayune*? I waited to see the result, though, in obedience to her directions, I had moved off a little.

'Oh, sir, come away; are you mad?' at this juncture cried Mary in so frantic a tone of voice, that I immediately joined her; 'my mother is certainly mad if you are not. How she frightened me! I shan't get over it for a month.'

'What in the name of heaven is she at?' inquired I, my curiosity roused more than ever.

'Do you not know? Did you never hear about my mother? Oh, if it is new to you, follow me and you shall see.'

Saying this, Mary—Betty was sitting, hardly yet re-

covered from her fright, on a log—led the way once more to the back of the house, to where, by standing on an old table, I could through a window survey the operations. Imagine my astonishment when, just as I rose, I saw Mrs Rock deliberately take up a tin canister of fine gunpowder, which on the previous day I had given Rock, but which had got damp, and pour out a quantity of it into the frying-pan. Then raising that culinary utensil, she as calmly as before placed it over the fire, and began to stir it round with the old wooden ladle. I turned to Mary and exclaimed against such infatuation; she replied that it certainly was so, but that, though for years her mother had been thus in the habit of drying gunpowder, no accident had ever happened. Whenever it was done, she added, in order that the whole risk might rest on her own shoulders, she cleared the house of all its inmates, and carried on her extraordinary operation alone. Despite the fool-hardiness of the old Irishwoman, I could not but admire her great courage, as also the care with which she removed all danger from her family.

'Well, Mary,' said I, 'you have surprised me indeed; but come, let us join your father.'

We accordingly did so, and old Rock was loud in his praises of our industry, both of the previous night and the morning, and appeared also somewhat ashamed of his anti-teetotal exhibition, but still did not refuse very shortly afterwards a pretty stiff morning, when offered him by the Yankee middle, who, I verily believe, had plied him with liquor out of mere mischief the night before; and when I afterwards expostulated with him on the impropriety of his conduct, he tried to look grave, and said—'Well, sir, the old man warn't used to it, and sartainly was pretty extensively chawed up; but then, sir, it ain't often he takes a slanting perpendicular, and you can't blame me for not putting a bowie knife between the old man and the bottle.'

We were shortly summoned to breakfast, after which, having received an affectionate embrace from both my fair friends, and not without much regret visible on both sides, we departed, and pulled up the river to the 'big timber,' accompanied by young Rock, who was to serve as our cicerone. In accordance with solemn promises given on my part, I more than once again visited Rockville, and the reader has already had some account of one of my peregrinations.

ITALIAN PRIESTS IN PEKIN.

SEVERAL of our readers as perused the notices on the Chinese which have from time to time appeared in this Journal, will be fully aware of the obstacles which oppose every foreigner who endeavours to travel amongst that jealous people. Hence the personal narrative of any European who has penetrated into China, and who has resided there for a series of years, is valuable in proportion to the extreme dearth of such narratives. We feel, therefore, the more gratification in introducing to our readers a book of this nature, which has been recently issued by Mr Murray as one of that cheap and excellent series of works called 'The Home and Colonial Library.' It is entitled 'The Memoirs of Father Ripa, during Thirteen Years' Residence at the Court of Peking, in the Service of the Emperor of China.'*

After all that is known of the rigid caution with which the Chinese exclude foreigners from their country, it may puzzle our readers to imagine how an Italian missionary was allowed to live in the very heart of the empire for so many years. This we deem it necessary to explain:—By the sixteenth century, that powerful community of Roman Catholics known as 'Jesuits' had caused their missionaries to penetrate into Africa and Asia; but China was still closed against them. In 1579, however, Miguel Ruggiero, an Italian Jesuit, reached Canton, where he was allowed to take up an insecure and precarious residence. In a few years he was joined

by his compatriot, Matthew Ricci, a man of great genius and unquenchable religious enthusiasm. The principles which guided the Jesuits in their missionary efforts were such as could only succeed in China. Their well-known practice was to appear to succumb to every prejudice, to engage in every sort of experiment which was not actually sinful that would aid to the consummation of making converts. Their leading motto was, 'the end justifies the means.' Guided by such principles, Ricci actually pretended to be converted to Buddhism, and assumed the garb of a Bonze, or priest of that persuasion! This course he soon found inexpedient, and speedily abandoned it, taking upon himself the character of one of the Chinese literati. For this he was fully qualified. Already a man of profound learning and great scientific acquirement, he increased his stock of knowledge by mastering the Chinese language, and much of its literature. After employing about seventeen years in these pursuits, his fame reached Peking, where he was received with great favour by the emperor. He soon invited other Jesuits to join him: the court was delighted with the scientific experiments and knowledge of their guests, who—gradually introducing the principles of Christianity—along with astronomical, chemical, and other sciences, in time gained the ear of the emperor. The native literati praised such Christian precepts as coincided with those of Confucius; but the doctrine of monogamy, and several tenets opposed to their own, they repudiated. Ricci and his coadjutors, however, were so successful, that permission was given them to build two churches; and they would in all probability have gone on prosperously, had they not been opposed by missionaries belonging to different 'orders' of the Catholic church, who disapproved of the means they used to introduce Christianity, and went to Peking expressly to oppose it. Squabbles ensued of a nature to give the Chinese a mistrust not only of the professors of Christianity, but of its doctrines; and although they were not expelled the kingdom (being found extremely useful in the mechanical and fine arts), they were sometimes imprisoned, and always mistrusted. Such was the state of the Catholic missions soon after the death of Ricci, and up to the year 1692, when things took a favourable turn. Kang-hi, one of the most enlightened of the emperors, issued a decree permitting the exercise of the Christian religion. From the writings of the missionaries who from time to time resided in China, all that was ever known in Europe regarding China was made known.

We are now prepared to take up the interesting story before us. The subject of it, Matteo Ripa, commences his narrative by the following striking passage:—'In the year 1700, as I was strolling one day about the streets of Naples in search of amusement, I came to the open space before the viceregal palace, just at the moment when a Franciscan friar, mounted on a bench, began to address the people. I was only eighteen; but, though so young, I was then leading a life which I could scarcely describe without shocking the reader. Amid all my vices, however, it was fortunate for me that I always listened with pleasure to religious discourses, not indeed with a view to derive any profit or instruction from them, but merely out of curiosity. The preacher took for his text these words of the prophet Amos, "For three transgressions of Damascus, and for four, I will not turn away the punishment thereof;" and he proved that there were a certain number of sins which God would forgive, but that beyond that number there is no salvation for any one. From the proofs, he passed to the morality of the doctrine, and here he brought in the beautiful illustration of the scales, which, when equally balanced, the smallest addition will weigh down. "Thus," said the worthy father, "if, when our sins are equal to our counterpoise, we commit one more offence, the beam on which our lot is weighed will turn and fix our eternal perdition; and as we do not know when our scales are balanced, if we transgress at the risk of such a punishment, we deserve condemnation." This was not to me

* Selected and translated from the Italian by Fortunato Prandi.

a mere figurative illustration, it was a gleam of heavenly light by which I perceived the dangerous path I was treading; and methought I saw God himself menacing me from above, while below the torments of hell lay ready to receive me. On recovering from the horror I felt at the sight of the danger to which I had so long thoughtlessly exposed myself, I ardently thanked the Almighty for thus recalling me to himself, and, full of repentance, I resolved to devote the remainder of my life entirely to his service. When the Franciscan had finished his impressive sermon, to strengthen my purpose I proceeded at once to the church of the great apostle of India, St Francis Xavier, which was close by; and there having found a Jesuit who, by the will of God, was preaching on the same subject in the presence of the Host, I had the most favourable opportunity of fulfilling my object.

Ripa lost no time in qualifying himself for the priesthood, and was in due time ordained. Feeling an irrepressible desire to spread the gospel in foreign parts, he was accredited by the Propaganda (the headquarters of Catholic missions in Rome) to China. Starting for England, he obtained a passage in one of the East India Company's ships, and arrived at Canton in the early part of 1710. True to the principles which actuated the early Romish missionaries, Ripa kept his real object in the back-ground, and employed himself as a painter, having acquired a proficiency in the arts. In this quality he had the good fortune to be engaged by the emperor; set off for Peking, and arrived there on the 5th January. Of this city the worthy father affords some curious particulars, which, although relating to it as it existed a century and a-half ago, applies in the main features to the present time; for the Chinese are such 'incurable conservatives,' that their modes of life never alter, and their cities present exactly the same general appearance now as they did thousands of years ago. The only difference is, that with the increase of population they have increased in size. 'The city of Peking,' as Ripa correctly explains, 'was once called Se-yun-tien-fu; but it received its present appellation when the emperors of China removed the government from Nankin to the north of the empire, in order to oppose the incursions of the Tartars. As Nankin means south royal residence, thus Peking signifies north royal residence; the word *nas* meaning south, *pe* north, and *king* royal residence. It lies in a plain which stretches to the south for more than ten days' journey without interruption, whilst at no great distance towards the north it is bounded by very numerous mountains. Owing to this extensive plain on the south, and this multitude of mountains on the north, Peking is exposed to deadly heat in summer, and severe cold in winter. The transition from one extreme to the other, however, is slow and gradual, so that the Chinese of the upper classes go on changing their clothes all the year round. In summer they wear a cotton shirt, a waistcoat of light ko-poo, linen, a loose gown of the same material, called ppow-zoo, and over this a light silk spencer, called why-tao. When the heat begins to decrease, they exchange the ko-poo for a sort of crape called sha, and this again for satin; and, as the weather gets cool, they wear the ppow-zoo lined, and the why-tao wadded, then both these garments wadded, after which they adopt the furs of ermine, sable, and fox, in the same gradation. In the depth of winter, besides having both the ppow-zoo and why-tao lined with fox-skin, they wear an under waistcoat of lamb-skin, and the loose gown over it wadded; and when it snows, they put on a long cloak covered over with seal-skin. In spite of all this, they still shiver with cold; and Count Ismailoff, the Russian ambassador, told me that he and all his suite had been obliged to add garments to those they had been accustomed to wear, as the cold was far more intense here than at Moscow. During the period of frost, that is, from October till March, Northern Tartary sends to the capital an enormous quantity of game, consisting chiefly of stags, hares, wild boars, pheasants, and partridges;

whilst Southern Tartary furnishes a great abundance of excellent sturgeon, and other fish, all of which being frozen, can easily be kept during the whole winter. At the close of the old year, and the beginning of the new, huge heaps of game and fish are exposed for sale in the streets, and it is surprising to see how cheap they are sold. For seven or eight silver tchens, which are equivalent to four shillings, one may buy a stag; for a trifle more, a wild boar; for five halfpence, a pheasant; and so on in the same proportion. During the winter, it never rains at Peking, and it snows but seldom and sparingly. From March to June there are occasional showers; but in July and August it rains copiously. It is not a little singular that so vast a difference of climate should exist between Ripa's native city, Naples, and that of Peking; for there is scarcely one degree difference of latitude between the two places; yet 'in Peking, from September till March, the cold increases in uniform gradation, and from March to September decreases in the same manner, while at Naples the weather passes from one extreme to another in the course of the same day, owing to the prevailing siroccos, or violent south-east winds.

'Peking,' continues the missionary, 'is composed of two distinct cities, one being called the Tartar city, the other the Chinese. The Tartar city is so named because it is inhabited by Tartars, and by those who, though not Tartars, are enrolled in the Ki-hiu-ti, or eight bands which constitute the Tartar troops. The Chinese city is inhabited by Chinese alone. It may be proper to observe, that the district now called the Tartar city was in former times inhabited by the eunuchs in waiting, who amounted to ten thousand; but under the present dynasty, it is inhabited, as I have said, by Tartars and Chinese of the Ki-hiu-ti. The eunuchs, now about six thousand in number, live entirely within the walls of the palace. The Tartar city is square, and encircled by a yellow wall. It is within this yellow wall that the imperial palace is situated; but it is surrounded again by another wall, more lofty than that of the city, and of vast extent. The inhabitants within amount to a great multitude; for, besides the six thousand eunuchs, there is in the seraglio a vast assembly of women, of whom the emperor alone knows the number. There is also within the imperial residence a great number of Tartars who are in the service of the emperor's sons, each of whom has his separate court; so that this palace may be very well considered as a third division, and Peking described as containing three distinct cities. The Tartar city has nine gates, and each side of it is three miles in length. The Chinese city, which is also walled, joins the northern wall, which separates it from the Tartars. It is of the same size, but of a different form, being longer from east to west than from north to south; and it is more densely peopled with the middle and lower classes than the other city. In its four sides there are seven gates; and thus Peking has in all sixteen gates, and outside every gate there is a large suburb. The two cities together are twenty-one miles in circuit, according to a measurement made by the command of the emperor. If to the circumference of twenty-one miles be added the suburbs and environs, which are also very populous, particularly those towards the west, through which nearly the whole commercial traffic of the Chinese capital passes, some idea may be formed of the vast size of this city. The palace, standing in the midst of the Tartar city, as already stated, has a southern aspect, and is in shape an oblong square, two miles in length, one in breadth, and six in circumference. The walls are enclosed and protected by a broad and deep ditch. There are three gates on each side, that in the centre being opened for the emperor only, that towards the south for the heir-apparent, and the third for general use. These gates are guarded night and day by soldiers. Within and above these defences rises another wall, forming as it were an inner palace, in which reside the emperor, his ladies, the women in waiting, the eunuchs, and the imperial family. There is also a spacious garden, into

which no one is admitted without an express permission from the sovereign. Those thus favoured, upon entering, write down their names, and upon leaving it blot them out. The splendour of the palace is equal to its extent; and though constructed according to the singular architecture of the Chinese, which resembles no other, except perhaps, in a slight degree, the Gothic, yet the whole is pleasing, and contains much that is excellent and even wonderful.*

It is well known that the emperor of China very seldom exhibits the light of his august countenance to his subjects. When he has occasion to stir abroad, he is 'always preceded by a great number of horsemen, who clear the streets entirely, causing all the houses and shops to be shut, and a canvass to be drawn before every opening, so that no one might see him. The same precautions are taken when the emperor's ladies, or those of his sons, are about to pass. His majesty generally comes forth on horseback, and the ladies are always conveyed in close carriages.' Upon, however, the celebration of Kang-hi's sixtieth birth-day, which was a great day of rejoicing,* his celestial majesty condescended to show himself to his admiring people. 'The openings of the cross streets were not stopped, nor the doors shut, nor were the people driven away. The streets and roads were now crowded with countless multitudes desirous of beholding their sovereign. He rode on horseback, wearing a robe covered with dragons, magnificently embroidered in gold, and having five claws, the five-clawed dragon being exclusively worn by the imperial family. He was preceded by about two thousand horse soldiers, in splendid array, and immediately followed by the princes of the blood, who were succeeded by a great number of mandarins. After these came a large body of soldiers, marching in a promiscuous mass, without observing any order. We Europeans were disposed in a rank near a bridge at no great distance from the palace, where we awaited the arrival of his majesty upon our knees. On passing by, he paid particular attention to each of us, and smilingly inquired which were those employed in drawing the map. A vast number of aged but healthy men had been sent to Peking from all the provinces. They were in companies, bearing the banner of their respective provinces. They also carried various other symbols and trophies, and being symmetrically drawn up along the streets through which the emperor was to pass, they presented a very beautiful and uncommon appearance. Every one of these old men brought a present of some kind to the emperor, which generally consisted of vases and other articles in bronze. His majesty gave to each of them twelve silver tael, a coin worth about five shillings, together with a gown of yellow silk, which is the imperial colour. They afterwards assembled all together in a place where the emperor went to see them: and it was found that this venerable company amounted to four thousand in number. His majesty was highly gratified with this spectacle; he inquired the age of many, and treated them all with the greatest affability and condescension. He even invited them all to a banquet, at which he made them sit in his presence, and commanded his sons and grandsons to serve them with drink. After this, with his own hand, he presented every one of them with something; to one who was the most aged of the whole assembly, being nearly a hundred and eleven years old, he gave a mandarin's suit complete, together with a staff, an inkstand, and other things. Many compositions in verse and prose were produced on this auspicious occasion; and some of our missionaries humbly petitioned his majesty for a copy of the collection to send to Europe, which he granted, commanding Father Bovet to translate them. In these poems divine titles and honours were given to Kang-hi, who was indeed held in such veneration throughout China, that he often received the appellation of *Fo*, a national deity universally adored both by

Tartars and Chinese. I myself very frequently heard him designated as the living *Fo*.' To show the extreme reverence in which the emperor is held, and the extraordinary restraints imposed on those who are near his person, we need only quote the following anecdote. His celestial majesty was on a hunting excursion:—'Although,' says Ripa, 'our party amounted to about thirty thousand persons—a number which, under all circumstances, must produce great noise and confusion—yet when the emperor was encamped, and the sun had set, the silence enforced was perfectly astonishing. One day Pedrini and myself having returned to the encampment after sunset, my friend ordered a servant to call our conductor, to whom he wanted to speak. The poor fellow resisted for some time, but being pressed by his master, he at last obeyed; and scarcely had he opened his mouth, before he was seized by the soldiers of the guard, and very severely bastinadoed.'

Some of Father Ripa's personal experiences were extremely curious, and prove very instructive as to the habits and manners of the Chinese. We have never met with a more graphic instance of that filial piety for which the Chinese are proverbial, than that which he relates. 'One day as I was talking in my own house with a mandarin who had come to pay me a visit, his son arrived from a distant part of the empire upon some business relating to the family. When he came in we were seated, but he immediately went down upon one knee before his father, and in this position continued to speak for about a quarter of an hour. I did not move from my chair till, by the course of conversation, I discovered who the person was, when I suddenly arose, protesting to the mandarin that I would stand unless he allowed his son to sit down also. A lengthened contest ensued, the father saying that he would quit his seat if I continued to stand; I myself declaring that it was impossible for me to sit while his son was kneeling; and the son protesting that before his father he must remain on his knees. At last, however, I overcame every scruple, and the mandarin signified to his son by a sign that he might be seated. He instantly obeyed, but retreated to a corner of the room, where he timidly seated himself upon the edge of a chest. A year after this, the son again came to visit me, having now become a mandarin himself. I offered him the seat of honour which was due to him, but he refused it, saying that it did not become him to take the same seat which, as I might remember, his father had occupied the year before. Accordingly, when an emperor dies, his son never sits upon the same throne, but upon that which had been used by his grandfather.'

Having acquired a proficiency in the Chinese language, Ripa was appointed interpreter, especially to a co-missionary who was intrusted with the care of the emperor's innumerable clocks and watches. While serving in this capacity his patron, Kang-hi, died, and this event turned the father's thoughts towards home. While that monarch lived, departure would have been impossible, because every person, on entering the imperial employment, takes a solemn oath that he will serve the emperor 'even unto death.' As it was, the object could not be easily attained; and the manner in which it was effected at once illustrates the official punctiliousness of the Chinese, and the extent to which the elastic consciences of the class of missionaries to which Father Ripa belonged will stretch. As the new emperor, Young Chin, 'was still sorrowing for his father's death, and as great indulgence is generally shown in China to persons recently bereft of their parents, I hoped to succeed by alleging a similar loss'—in other words, by telling a downright fib. 'Accordingly, I applied to the emperor's sixteenth brother, who expressed himself well inclined in my favour, and advised me to petition the Too-yoo-soo. This board referred me to his majesty's thirteenth brother, who had the charge of the collection of clocks and watches, and was consequently my immediate superior. The prince kept me a long time in suspense, with a profusion of gracious smiles and words; some-

* In China, sixty years is reckoned as a century.

times he even turned aside as he passed, and pretended not to see me whilst I waited for him on my knees. At length I discovered that, in spite of all his promises, he was opposed to my departure; and knowing the magic power of gifts in China, I took all the European curiosities I still had in my possession, and sent them to his residence. They were all accepted, which was a good omen; and soon after, the joyful announcement was sent me that the emperor, in consideration of the services I had rendered to his father, had been pleased to grant my petition, ordering, moreover, that I should receive some valuable farewell gifts of silk and porcelain.

After a voyage full of miseries and vicissitudes, Father Ripa arrived in England, and met with a brilliant reception from George I. and his court. He then proceeded to Naples, and having brought with him three Chinese youths and an adult convert, he founded a college in Naples for the reception and education (for missionary purposes) of a limited number of Chinese. From this college Lord Macartney, when he undertook an embassy to China in 1793, selected his interpreters. It still exists, and contains eight pupils, six of whom are natives of China. Father Ripa, while living in the college as its chief, composed his autobiography, from which the work now before us is selected and translated. He died on the 22d of November 1745.

BLUNDERS OF FRENCH TRANSLATORS.

THERE are no translators so persevering and fearless in blundering as the French. It is notorious that, as a rule, English, Spanish, and German words, whenever they occur in French print, are spelled wrong; correctness being only a rare exception. Doubtless the French words, with which it has become fashionable of late amongst certain authors to sprinkle our own language, are not always correctly printed; but, in the case of proper nouns, we do not at least perpetuate error. Now, the French appear to make a point of misspelling every name of a place or individual which they find in a foreign tongue. It is a peculiarity as old as the days of Froissart, who calls Edinburgh *L'Islesbourg*, and Dalkeith *D'Alquest*, and makes similar errors all through his book, as if he had regarded it as of some importance thus to transmogrify our language. To this day, this disposition to misrepresent English names is as rife amongst our neighbours as ever. We have an example before us in a French newspaper a few weeks old, where there is a list of the guests entertained by an English gentleman at Cannes, in Normandy, who are said to be amongst the most celebrated people in this country; from the manner in which their names are given, it is quite impossible to know who they may be.

The story is well known of the French translator, who came to a passage in which Swift says that the Duke of Marlborough *broke* an officer, and who, not knowing that the expression meant dismissing a person from the army, rendered the passage by the word *roué*, by which it was conveyed that Marlborough broke the poor man on the wheel. Another Frenchman gives a not very delicate notion of Cibber's comedy of 'Love's Last Shift,' by calling it *La Dernière Chemise de l'Amour*. In like manner, a writer of Congreve's life, missing a letter in the tragedy of the 'Mourning Bride,' translated it *l'Epouse du Matin*, 'The Bride of Morning.' But the most singular mistaking of a book-title is that mentioned by D'Israeli, who declares that a modern French bibliophile placed Edgeworth's 'Essay on Irish Bulls' in a catalogue of works on natural history, as if it had been a treatise on horned cattle.

A series of blunders have been committed through

a more pardonable ignorance of English idiom. An early French editor of Shakspeare's plays, not approving of his predecessor Le Tourneur's paraphrastical version, boasted of giving a more faithful one. As one proof of his capabilities for the task, he conveyed a most ridiculous notion of the following couplet in the Earl of Northumberland's celebrated speech in Henry IV.—

'Even such a man, so faint, so spiritless,
So dull, so dead in look, so *too-beyond*.'

The last words were paraphrased thus:—*ainsi, douleur! va-t'en!* which, re-translated into English, signifies—'So, grief—be off with you!' In one of Sir Walter Scott's novels, that favourite supper-dish, 'a Welsh rabbit,' is mentioned. The French translator renders it literally by the words *un lapin du pays de Galles*: adding, in a note, that the wild rabbits of the Welsh mountains have a peculiarly fine flavour, which makes them to be uncommonly relished throughout Great Britain.

It is, however, in the works of French travellers that we shall find the most amusing mistakes, arising from a very natural ignorance of our idioms and customs. One gentleman, perceiving that an inn in London was called 'The Green Man and Still,' assured his readers that the sign meant the 'Green and Quiet Man,' by translating it *l'Homme Vert et Tranquille*. A large amount of diversion is to be gleaned from the work of a certain M. de Groseley, which purports to give an account of English customs. Amongst other things, he is very learned on what he is pleased to call 'the Boxk,' by which he means boxing. 'Everybody,' he remarks, 'knows the passion of all classes and conditions of the English for the boxk;' adding, that the boxk is an indispensable part of an English gentleman's education. Fathers and mothers make their children fight in their presence. From an utter confounding of the term 'professor,' he mistakes the now almost extinct class of professors of boxing for the professors at the universities; which induces him with amusing earnestness to lead his readers to suppose that the grave and reverend professors 'in all the schools and colleges' encourage, like the fathers and mothers, their pupils to fight. There is an irresistible comicality in the idea of an Oxford professor of divinity, or the Edinburgh professor of moral philosophy, demanding 'a ring' at the close of his lecture, and selecting a couple of favourite pupils for a pugilistic contest, for the edification of the junior students. The same writer explains the etymology of 'black-leg,' by declaring that all English cheats and sharpers wear boots, 'which they never take off.' A more diverting, because a more elaborated blunder, occurred some weeks since in a daily French newspaper. An English journal, in giving an account of a horse-race, declared that a number of persons belonging to Birmingham had lost large sums on the issue; but, in the phraseology generally adopted in reference to such matters, announced that the 'Birmingham school' had suffered severely. To this paragraph the French editor added the following edifying commentary:—'Thus, we perceive, that in England to such a pitch has the passion for betting arrived, that there exist all over the country schools and seminaries for teaching the young how to lay wagers.' But this is even less amusing than the felicitous accuracy of another travelling journalist, who translated 'The Independent Whig,' a now deceased English newspaper, by the words *La Perruque Independante*. A tourist, wishing to give accurately the origin of the above term, used to denote a particular political party, says they take their name from the Isle of Wighh; but not content with this blunder, he ends the same sentence by confounding the

Isle of Wight with Gretna Green; 'it is there,' he adds, 'that all runaway matches are made.' It would seem that many French translators prefer imagination to inquiry in supplying information to their readers.

VIEWS OF CANADA AND THE COLONISTS.

THIS is the title of a little volume, which we hail with much satisfaction as a fresh and trustworthy informant on the most important of our colonies.* The author has been induced by modesty to withhold his name from the title-page; but we can vouch that he is known in our city as a highly respectable person, free from all connexions which could produce a bias in his mind in favour of either the colony generally, or any of its particular districts. Sent thither on a business mission, he was induced to remain for a few years in the London district in the upper province, and he has only returned temporarily, from considerations as to his health. The volume contains—first, ample information of a minute and faithful character respecting the beautiful and prosperous district in which the author resided; second, a series of chapters of general intelligence respecting Canada, with instructions for those desirous of emigrating. Much of this intelligence is from official sources, and the whole has the advantage of being recent—a point of considerable consequence, where a country is concerned upon which every two or three years works a material change.

Mr Brown, for this is the author's name, is generally favourable to Canada. He speaks of the comfort of the farming class, with their 'own free farms, light taxes, and plenty of beef, bread, and wool'; also the appearance of abundance at their tables; yet admits discomforts of a physical and social nature, which may not be easily put up with by certain persons. One fact is apt to strike an inhabitant of our own country with peculiar surprise, that in the London district, amongst a population of 30,000, 'the number of persons subsisting on alms is *ten*'—one for every 3000; the paupers of England being, we believe, one in every twelve. 'And even this amount of pauperism,' says Mr Brown, 'is perhaps not real; at least I should say it is of a different nature, arising from other causes than yours—chiefly from four causes, I should suppose; first, extreme intemperate habits; old age distant from relations; physical disability in like circumstances; and, lastly, it may be a depraved choice, attended sometimes by some one or more of the three other causes. But this is a good deal conjecture, owing to the subject engaging so little attention, and in the humiliating forms in which you have it, being almost excluded from observation. During the four years I have been in Western Canada, I have scarcely met a case of the low beggary which is so pitifully prominent with you. Of cases which I can call to mind, I will tell you two which occurred this last winter. One cold morning, a woman poorly clad, with a sickly-looking child in her arms, entered a shop and begged assistance. She had lost her husband, she said, and was travelling in search of him, and her child was ill and in want of food. The shopkeeper on the instant told the case to a few of the neighbours, and the result was a contribution of a little money, an article or two of clothing, and a supply of food. In about an hour or so after this, the woman was observed in the open street, half-sitting, half-lying upon the ground, in a state of intoxication, and with her poor sick babe uncared for, and the loaves of bread she had received scattered on the road. The other case was that of a man who represented himself as a weaver from Paisley, who had come to Canada the previous season with his family, and had been unable to procure employment; and that his wife, whom he had lodged some miles distant, was confined, and in want of several necessaries. The man's appearance and story being trusted, he received on the spot

some few articles necessary in the circumstances he had represented; and, by being recommended for further assistance, a trifle of money was collected for him. Perhaps you have anticipated the result—it was afterwards believed to have been so—a case of deception. In this country, you perceive, there is this so different from yours, we are apt to be more liberal, and doubt less when assistance is asked—indications certainly favourable of the state of society.'

Speaking of the *township* of London—'In 1817, there were only two families living in this township, and now the population may be stated at nearly 7000—having 90,000 acres of land, 17,000 of which are cultivated. The first regular settlement was commenced in 1818, under Mr Talbot, a gentleman from Ireland, accompanied by several of his countrymen, for whom he obtained from government free grants of land, and a free passage to Montreal. In 1829, seven years after settlement, the township contained a population of 2415, with 5941 acres of cleared land; in 1834, it had increased to 5051, with 12,841 cleared acres; and in 1841, it was 6257. These two last-mentioned periods include the town; but in 1841, the township alone had a population of over 4000. A son of the founder, writing in 1834 respecting this township, gave this account of the colonists who emigrated with his father:—"Scarcely an individual who accompanied Mr Talbot to this country was possessed of more than L.100, and many on their arrival in this township had not more than L.50; yet of all those persons there is scarcely one that is not now wholly independent, in the possession of fine farms, of an abundance of stock, and in the enjoyment of all the comforts, and many of the luxuries of life." The town of London, which enjoys a central situation amidst the lakes Ontario, Erie, and Huron, and which can be approached in five directions by mail coaches, is laid out 'on the plan of several main streets running parallel with each other, east and west, and cross ones intersecting at right angles. There are five of what we call the main, and four of the cross streets, which have as yet been much built upon; and on the west point of the town, overlooking the river, an open space in the form of a square is left, on which the district court-house and jail is built, and which from this receives the name of Court-house Square. This public building has a rather striking appearance from its castellated style, and being built of brick coated with mortar, to resemble stone. The internal accommodations, however, have been found too inconvenient and limited for the increasing population of the district, and a considerable addition is contemplated during this summer. At one of the corners of this square is the district school, a respectable-looking two-storey wooden-frame building. Next to the school is another two-storey building, but much larger, with pediment and portico, and intended to be finished with columns. This is the hall of the Mechanics' Institute. A stranger may well be astonished at the evidence in this stately-looking and capacious building, of the zeal for knowledge and enterprise in a town like this, which had no existence seventeen years ago. London, I believe, in the spirit with which this institute is supported, is an example to the whole province. I am not aware of another instance in Canada—not even in the comparatively polished and most English-like town, Toronto—where a building has been erected for a popular institute. The hall of the London institute was opened last winter, and contains on the ground-floor rooms for a day and evening school, for a drawing and modelling class, a library, museum, a room for chemical and other apparatus, and apartments for a teacher or keeper, and the whole of the floor above is occupied as a spacious lecture-hall. During the winter evenings, the inhabitants are enlightened by lectures upon scientific and general topics, delivered by ordinary and honorary members resident in the town and neighbourhood. One of the best lectures delivered last winter was by the warden of the district, John Wilson, Esq. a barrister of talent and eminence, who is greatly respected here. The subject

* *Views of Canada and the Colonists. By a Four Years' Resident. Edinburgh: A. and C. Black. 1844. 18mo. Pp. 268.*

was optics, and was so ably handled and illustrated by drawings and apparatus, that, altogether, I do not think, even had the lecture been in your own Modern Athens, you could have desired to have been more gratified. James Corbett, Esq., a gentleman connected with the department of royal engineers, also delivered before the institute lectures on geology; and several others, including members of the clergy, contributed their services: such is generally the good feeling and understanding among all classes. The lectures are remarkably well attended, aided much by the enlivening presence of the ladies. There is a tolerably good library, rapidly increasing, in connexion with the institution; the fees of membership are 3s. a-quarter, and 4s. at entry; and members are restricted to no class of the community. You may perceive from this, that, with a circulating library, and reading-room besides, kept by one of the three booksellers in town, we are not quite in the wild woods here shut out from all knowledge. Two-thirds and more of our books are supplied through the United States, by means of the astonishingly cheap reprints, of which you will have heard. Think of Allison's Europe for 16s., and Blackwood's Magazine for 9d. Besides Blackwood, we have the Dublin University, Bentley, the New Monthly, and all the Quarterlies, reprinted regularly with wonderful rapidity by one publishing house in New York soon after arrival, and the whole of them speedily circulated at low rates all over Canada. The Penny Magazine and Chambers's Journal have also large circulations.

'Entering the streets,' continues our author, 'one is most struck by the irregular appearance of the wooden buildings, each owner of a lot or site having built in such a manner as suited his convenience, and according to his taste or fancy. There are several large three-storey buildings, one or two of brick, a number of two storeys, and the greater proportion of dwelling-houses are neat and comfortable-looking cottages; though there are a good many, too, of small cheap temporary houses scattered throughout, chiefly in parts farthest off the main streets. The breadth of the streets strikes one neither as spacious nor narrow, being about sixty feet, though in an extension of the bounds of the town the width is considerably increased. The principal street, towards the west end near the square, is occupied by the shops, of which there is no want, for the supply of every comfort and luxury usually to be had in most of your own provincial towns. There is the respectable grocer's, where you may have good coffee fresh ground every morning at 1s. per pound, young hyson tea from 3s. to 4s., and black cheaper; good brown sugar at 5d., loaf at 7d.; then there are dried fruits, oranges, and lemons; and the good housewives need not fear for starch, blues, Day and Martin's and Warren's blacking, Bath brick, and all such et ceteras. In short, these shops are just much like your own, and in the prices of the staple articles, as I have shown you above, much more moderate than those you get so highly taxed at home. The province imports tea, coffee, sugar, and other groceries at moderate duties, from whatever country it can cheapest: we get a great part from the United States and the West Indies. Such articles as London porter and Edinburgh ale, Lochfine herrings, Glo'ster cheese, Elizabeth Lazenby's pickles, and Harvey's sauce, which are all commonly to be had, you do, indeed, pay a good deal higher for than in England. The drapers' shops, called here dry-good stores, are decked out about as gaily with silks, velvets, costly shawls, ribbons, laces, &c. as your own shops, and contain, as the rival advertisements say, which we have here too, large and varied stocks. With the keen competition that exists generally over Canada among the merchants and storekeepers, all descriptions of British manufactures are sold exceedingly low.'

The venerable originator of this settlement lives in a rural mansion, which Mr Brown describes very pleasingly. 'It was a delightful summer day on which I visited it; and entering by a prepossessing gateway

leading off the good main road, I found myself in a spacious noble-looking avenue. As far as I could see, there was the wide road with its grassy margin, and overhanging and bordering each side was the luxuriant and shady recesses of the tall, deep, old forest. I dropped the reins on my pony's neck, and the exquisite imagery of some of those rich portions of Spencer's Faery Queen flowing on my recollection, translated this far western spot of young Canada into a scene of hallowed old English ground:—

"A shady grove
Whose lofty trees, 'yclad with summer's pride,
Did spread so broad, that heaven's light did hide."

Here, methought, might have been the fair Una, when

"One day, 'high weary of the irksome way,
From her unhasty beast she did alight;
And on the grass her dainty limbs did lay,
In secret shadow, far from all men's sight;
From her fair hair her fillet she undight,
And laid her stole aside: her angel's face,
As the great eye of heaven, shined bright,
And made a sunshine in the shady place;
Did never mortal eye behold such heavenly grace."

Having reached a winding of the avenue, I was led by a gentle ascent and crescent-sweep to a view of the open grounds, where sheep and horned cattle were grazing in numbers. Descending into a flat grassy vale, through which a stream flowed, I crossed a bridge; and on gaining the top of the opposite bank, a range of a fine park presented itself, and at its extremity, overlooking the lake, I perceived the dwelling of the old colonel. I was struck by the grand view of the lake here: in a little I found myself standing on the edge of the lofty and steep bank overlooking the expanse of waters, without speck or ruffle, as they were that day, and a light haze bounding the farthest view. The slight motion of the lake laving the foot of the bank was all—as I stood some moments entranced by the scene with its calm stillness—that fell upon the ear. While turning towards the humble hermit-dwelling of the man with bold heart and nerve who had subdued a mighty wilderness, and saw growing up around him the beginnings of a new country he had aided so to plant—the flitting fancies of an imagination winging into the far future, presented, instead of the homely cottage, a magnificent mansion, and all detail in keeping with the noble-looking grounds and the grandeur of the expanded lake. I thought I could conceive, too, looking along its shores, the distant rising of smoke, as if from a mighty city. But the views vanished, and the regret came instead—who has not had such a regret?—that one could not live to see the full growth of those beginnings; he could only, when having to part with them for ever, witness the early healthful promises.

An older township—that of Delaware—was settled in 1795, under circumstances partaking of the romantic. 'Upper Canada,' says our author, 'first began to be peopled in 1784; the whole of it then was one vast forest. Niagara, situated on that finely salubrious neck of land between the head of Lake Ontario and the foot of Lake Erie, was one of the first settlements, as was also a similarly favoured tract of country some little way up Lake Erie, included now in the Talbot district, and familiarly called Long Point country. These two places were among the first foot-holds of the early settlers. The next steps forth into the interior were directed to the spot where now stands the pleasantly situated village of Ancaster, seven miles west of Hamilton, at the head of Lake Ontario. Soon after this first settlement of Ancaster, some members of the families who had removed there, pushing young men, conceived an expedition still farther into the country. The love of adventure, and the novelty of exploring a new country, would readily favour the idea of a trading speculation with the Indians; and off on this errand set the party westward, with some stores of tobacco, whisky, calicoes, knives, and trinkets. Having reached so far as Oxford, on one of the branches of the river Thames, east of London, they determined proceeding down the river in a canoe; and so loosening their well-laden little

bark to the current, away went the adventurers adown the winding and rapid Thames, beautifully wooded along its banks, the tangling brushwood and graceful sweeping willow overhanging its many bends and pleasant nooks. Steering around many a lengthened curve, and by the small, low, wooded islands—some like clumps of trees alone rising from the water—now between banks, with their bold steep of rich black and clayey loam, crowned by the luxuriant forest; next would open the fertile flats of meadow-land, more thinly wooded with the stately and widely-branching sycamore, and here and there willows and bushes of alder, with the wild vine twining about them, then bending over and dipping into the margin of the clear lively stream. Tired of the watchful steering and tending of their course down a rapid stream, without opportunity sufficient to mark the wild and stately luxuriance of the scenery, telling them of a wondrously rich soil, the adventurers naturally thought of halting for rest. So, fastening their canoe by the bank, the next moment they stood upon the threshold of the stately and shady olden woods—the towering forest—its far sombre and stilly depths, vaulted by the thick intertwining branches high above, seeming like some mighty temple, the rays of sunlight here and there flickering on the lower leaves of the less and bushier trees, or shooting in narrow streams down some massy trunk. Our tired adventurers seated themselves most likely upon one of the many old fallen trees scattered like benches about, as if inviting to rest and contemplation within the shady temple; some newly fallen, others mouldering, so that touching them, like a friable clod, they scatter into powder; others again—and those the forest wanderer loves much—with their thick elastic coverings of dry green moss, offering an easy seat across a clear cool spring—sometimes so small as nearly to be hidden—gurgling and playing lively through its miniature course of fallen leaves, and at times having even sand and pebbles for its diminutive bed. Upon one of these old mossy trunks our wanderers may have rested, the wild flowers around them appearing from amid the thickly-strewn leaves and long thin grass. Who would not have delighted to rest in such a place? The pillared, vaulted, and sombre forest, with its streaks of light and masses of shade—its carpet of leaves, and grass, and varied wild flowers—its mossy seats and purling streams—a scene awakening sensations at once pleasing and grand. You are charmed by the attractive variety; you love the flowers, the streams, and the murmur of the whole rising around you, and far over-riding, in its vast and calm solitariness, imposes the mind with profoundest awe. Our wanderers, accustomed to such scenes, were most likely simply to experience (besides impressions of the richness of the soil) a grateful rest, and, it might be also, sensations of their solitariness in such a place, where for miles and miles around them all was forest—deep solitary forest—without a white foot-
 step. Continuing their course, they would pass many a spot now enlivened by dwellings and cleared farms, and the din of mill-machinery; among others, the rising table-land on which now stands the town of London; unthink-
 ing it might be, as they looked upon the high banks, crowned and covered all backward by heavy forest—that here some of them would live to see, as they did, this spot the site of churches, shops, and a thousand or two busy inhabitants. Having reached the *Forks* (as the locality was long called before a house of the town was built, and even since, by old settlers, from the two branches of the river joining under the high west bank), they would then glide more smoothly upon the fuller stream, and keeping on their way till, fifteen or twenty miles further down, they made a halt. It was at one of the loveliest river nooks one could wish to linger by. This was the site of the present village of Delaware, famed by all for the beauty of its situation. The traveller along the main road from London westward, at once meets the river in a curving open valley; the opposite side high and wooded, and spreading from the foot of this rising bank are flats of meadow-land, with

scatterings of willows, poplars, and thorns; then the river in the midst, almost close beneath the village on the near side, flowing gently, full, and clear, with its shining unbroken glassy surface. Such was the spot the adventurers chose as a sort of head-quarters in their Indian traffic. Finding it convenient for profitable trade in disposing of manufactured stores in exchange for furs, and doubtless influenced, too, by the natural attractions of the place for a settlement, the result was an invitation to their friends, the older folks at Ancaster, who soon joined them, and so commenced the settlement of Delaware.

Referring to the volume itself for a great and varied range of information, we only deem it necessary to add, that Mr Brown inculcates caution to those who think of casting their lot in this colony. He endeavours to sober the views of artisans with regard to the remuneration of their labours, and plainly tells the bad workman, the intemperate, and the feeble, that Canada will not improve their circumstances. The following remarks seem to us highly judicious, and eminently deserving of attention at home. 'I would first observe, as a fundamental principle, that colonies appear to be as much, and of necessity, governed by the laws of demand and supply in regard to the amounts of the various descriptions of population required, as are individuals, companies, or communities in their ordinary transactions; and any departure from those laws inflicts injury as much in the one case as in the other. Grand schemes of emigration, conducted in the present state of our information with regard to our colonies, it is believed, would most probably present similar disheartening results, which grand schemes of other shipments would which had not been "ordered," or had been sent without full acquaintance with the particular necessities or demands of the country. The paupers "shovelled" out from England, and thrown under the rock of Quebec in ignorance or disregard of the wants of the colony, or fitness of the individuals to be proper colonists; the hand-loom weavers of the west of Scotland, unfitted, the majority of them, to supply the wants of Canada, yet flocking out in ship-loads to Quebec, and forwarded to the upper country at government expense—in many instances only to experience disappointment, and to be obliged to swell the public factories of the neighbouring republic—these are cases illustrative of the evils connected with even a very limited emigration, conducted without regard to the principles of demand and supply; and which, if extended as proposed, so as to allow a freer communication with our colonies, would only aggravate evils. The great error lies in supposing that the classes of persons who are overabundant at home, and consequently least wanted, are exactly those most needed by the colony. Broken-spirited paupers, hand-loom weavers, and other persons unaccustomed, and frequently quite unfit, for the kinds of labour in demand by the colony; as also a description of Irish labourers who either cannot, or will not work, except upon canals, and who flock out to the United States and to Canada, and are the cause of serious disturbances on account of their large numbers.'

AGRICULTURAL AND HORTICULTURAL SOCIETIES.

It is a very desirable matter that the aristocracy of any locality should take a deep and practical interest in agricultural and horticultural occupations. The sports of the field, though possibly necessary for the health and recreation of idle country gentlemen, and certainly great inducements to their residence on their rural estates, are often interrupted by unpropitious weather; and the extravagant amusements of the *turf*, or of the silly and cruel steeplechase, are at best but brief periodical excitements, which are often seriously depressing in their consequences to the over-worked mind, and exhausting to the purse, while they tend to render the human heart as callous as the whip or spurs in which the jockey glories. The individual whose horse is to run for the high stakes of a celebrated race, has nervous sensations unfelt by him whose cattle quietly con-

tend in the ploughing-match; and surely, in point of utility, there is no room for dispute as to the comparative advantages of the different pursuits. Then, as to gardening—where can there be found more innocent or interesting employment of the active kind, or which tends more, when scientifically conducted, to elevate and expand the mind? What relaxation for the saddened or fatigued spirit can be named, that is more calculated to soothe and relieve it than occupation in the greenhouse or open garden? And if idleness oppress—if the miserable sensation of want of something to do renders the fine lady or fine gentleman listless, where can a more pleasing excitement to thought and gentle exercise be found than in the garden and shrubbery? Nor is this pleasure occasional and evanescent—it may be enjoyed at all times; and the most delicate female can never be without inducement to inhale the free air of heaven—so essential to the preservation of her health and beauty—while she has her flower-garden and conservatory to visit and arrange. In short, the possession and management of a well-ordered farm and garden is a point of attraction to our gentry; and if they can support the expense of maintaining first-rate bailiffs and gardeners, who can win prizes in their respective departments, they not only encourage a class of men whose occupations are pre-eminently useful and pleasing, but they become the means of imparting to the inferior grades of rural occupiers that desire for acquiring good skill and taste in the management of their humble allotments which so decidedly tends to advance their condition. Although there may be occasional ground for dissatisfaction at the supposed ignorance or partiality of judges in the distribution of prizes, and that feeling of jealous rivalry which near minds so frequently entertain, with or without reason, still the principle of competition is useful. People of sense not only bear disappointments with good grace, but feel a generous pleasure in seeing displays of finer plants than they themselves possess, and, instead of grumbling at everything which has not been exactly in accordance with their own views and caprices, determine to persevere steadily in their efforts, being quite content to witness the progress of the art which they admire, without experiencing any mortification at their own failures, and very happy to see rich and poor assembled together for the enjoyment of a pure and rational pleasure.—*Martin Doyle.*

A HUMBLE READING-ROOM.

The following lately appeared in the *Glasgow Citizen* newspaper:—How little do people know of what is passing daily around them! Until the other evening, we had not the remotest idea that, on being conducted up the first stair of a dingy low-roofed close in Saltmarket (No. 115), we should observe, painted in white letters on a door, the words "Reading-Room." Was it possible that in such a locality—in the midst of vice and wretchedness—surrounded, as it were, by the very dregs of our dense population, there existed an institution devoted to mental culture and self-improvement? By what strange accident had a ray of light from the upper levels of society descended to this obscure alley? On entering, we passed a small kitchen to the right, with a fire burning briskly, and a shelf along the wall, supporting some half-dozen coffee-cups, with three or four bottles of lemonade. Before us were two rooms with tables and forms, and sufficiently lighted with gas, although, on the whole, rather scantily furnished. In one of these apartments were a few workmen—for aught we know, common labourers—with hard bushy heads, greedily devouring the news; while in the other, there was some one reading aloud to two or three gazing listeners, whose education had been more neglected. On inquiry, we learned that the subscription to the rooms, which were pretty well furnished with newspapers and cheap periodicals—such as *Chambers's Journal* and *Miscellany*—was only one shilling a quarter; and that among the subscribers there were no fewer than eleven who could not read! It was the first time we had heard of men ignorant of the alphabet subscribing to a news-room! This interesting establishment, which was started upwards of eight months ago, through the praiseworthy exertions of a person named Mr James Partridge, is denominated "The City Teetotal Reading-Room," and affords a curious instance of the good that is sometimes doing by private individuals in obscure places, and under circumstances apparently the most adverse. The funds, we understand, are at a low ebb; but a few subscriptions might easily be obtained in support of so laudable an object.

THE CONVICT SHIP.

BY THOMAS K. HERVEY.

MORN on the waters!—and, purple and bright,
Burst on the billows the flushing of light!
O'er the glad waves, like a child of the sun,
See the tall vessel goes gallantly on;
Full to the breeze she unbosoms her sail,
And her pennant streams onward, like hope, in the gale!
The winds come around her, in murmur and song,
And the surges rejoice, as they bear her along!
See! she looks up to the golden-edged clouds,
And the sailor sings gaily aloft in the shrouds;
Onward she glides, amid ripple and spray,
Over the waters—away, and away!
Bright as the visions of youth, ere they part,
Passing away, like a dream of the heart!
Who, as the beautiful pageant goes by,
Music around her, and sunshine on high,
Pauses to think, amid glitter and glow,
Oh! there be hearts that are breaking below?

Night on the waves!—and the moon is on high,
Hung, like a gem, on the brow of the sky;
Treading its depths, in the power of her might,
And turning the clouds, as they pass her, to light!
Look to the waters!—asleep on their breast,
Seems not the ship like an island of rest?
Bright and alone on the shadowy main,
Like a heart-cherished home on some desolate plain!
Who—as she smiles in the silvery light,
Spreading her wings on the bosom of night,
Alone on the deep!—as the moon in the sky—
A phantom of beauty!—could deem, with a sigh,
That so lovely a thing is the mansion of sin,
And souls that are smitten lie bursting within?
Who, as he watches her silently gliding,
Remembers that wave after wave is dividing
Bosoms that sorrow and guilt could not sever,
Hearts that are parted and broken for ever?
Or deems that he watches, afloat on the wave,
The deathbed of hope, or the young spirit's grave?

'Tis thus with our life, while it passes along,
Like a vessel at sea, amid sunshine and song!
Gaily we glide, in the gaze of the world,
With streamers afloat, and with canvases unfurled;
All gladness and glory to wandering eyes,
Yet chartered by sorrow, and freighted with sighs;
Fading and false is the aspect it wears,
As the smiles we put on, just to cover our tears;
And the withering thoughts which the world cannot know,
Like heart-broken oxen, lie burning below;
While the vessel drives on to that desolate shore
Where the dreams of our childhood are vanished and o'er!

—From a Scrap-book.

SEA-SICKNESS.

There is now in the collection of useful inventions in the gallery of the Royal Polytechnic Institution, London, a model of a swing sofa, invented by a Mr Joseph Brown, for the purpose of preventing that dreaded malady, sea-sickness. Mr Brown's invention is at once simple and ingenious, applying itself to the cause, and not to any empirical cure of the disease when once engendered. Sofas, beds, couches, cots, or chairs, are so suspended on springs, that however a vessel may roll and pitch, the sofa or chair, as the case may be, is preserved on a perfectly horizontal equilibrium, and all oscillation effectually prevented. The motion of the ship, even during the most tempestuous weather, being thus counteracted, those who recline or sit on the sofas and chairs are as perfectly steadied against any lurch, as if they were sitting or reclining on land. A number of the higher class passenger ships, it is said, have adopted Mr Brown's invention; and there can be no doubt that, if it effectually overcomes the motion, it will avert the disease.

COMMON SENSE.

Fine sense, and exalted sense, are not half so valuable as common sense. There are forty men of wit for one man of sense; and he that will carry nothing about him but gold, will be every day at a loss for ready change.—*Brown.*

* * * Complete sets of the Journal, First Series, in twelve volumes, and also odd numbers to complete sets, may be had from the publishers or their agents. A Stamped Edition issued for transmission, post free, price Two-pence halfpenny.

Printed by William Boddie, of No. 6, York Place, and Frederick Bellist Evans, of No. 7, Church Row, both of Hibernia, in the county of Middlesex, printers, at their office, Lombard Street, in the precinct of Whitefriars, and city of London; and Published for the Proprietors, W. and R. CHAMBERS, by WILLIAM SOMERVELL, 15, Old Bailey, and at 2, Abchurch Lane, and at No. 2, ABERNETHY, both in the parish of Christ Church, and in the city of London.—Saturday, January 25, 1866.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No 57. NEW SERIES.

SATURDAY, FEBRUARY 1, 1845.

PRICE 1½d.

PENNY-A-LINERS.

PENNY-A-LINERS are the stragglers of the London press—the foragers for stray news—the narrators of fires, street accidents, suicides, murders, police cases, and all the odds and ends that fill up the columns of newspapers in default of political opinions, debates, and foreign intelligence. They have no engagement with the press. They are often wholly unknown, except by name, to its conductors. Their plan of life is simply to contribute, to all journals alike, whatever scraps of news they may be able to collect. For this purpose they hang about hospitals, fire-offices, and coroners' courts; besiege police-officers, churchwardens, overseers, and magistrates: and are perpetually going about in watch for what the chapter of accidents may throw in their way. They are paid by the line for their contributions, and hence their designation; although, of late years, they have so far advanced in the world as to receive three-halfpence per line, instead of one penny, as formerly. They have of course an inducement to tell their stories at as great length as possible; and one of the chief miseries of London editors and sub-editors is to prune their exuberance—'cut them down,' as it is technically termed—by weeding their phraseology of all their superabundant epithets and needless circumlocutions. There may be about sixty men known as having this off-and-on connexion with the press, besides perhaps as many more who pretend to the same connexion, and live by the frauds they commit under that assumption.

The penny-a-liner, humble and unknown as he is—gaining a precarious and generally miserable existence; having £10 in his pocket one week, the proceeds of some interesting murder, and starving the next, because people are too moral or too fortunate to afford him, for the time, anything to write about—passes a life, we seriously believe, by no means deficient of enjoyment. Amidst all the occasional distresses of his situation, he must have some satisfaction in seeing the extensive circulation given, by the press at home and abroad, to his homely lucubrations: And his very duty or business involves a variety of scene and pursuit that cannot be otherwise than agreeable.

Delightful to him must be the first rumour of one of the grander class of murders. He scents the affair afar off. The slightest hint gives him a clue to 'further particulars'; and with a zeal, an energy, and an acuteness that are seldom equalled, he will scour the country for miles around the metropolis in search of all kinds of collateral information. He manages also to excite the curiosity that he is afterwards to feed, and which is to feed him. For the sake of his little fee, he will attach himself to a great criminal from his first commission of the deed of blood until his life pays the penalty of his crime—tracking him by surmises when he is at large—

attending his examination before magistrate or coroner when apprehended: he narrates his behaviour in prison, who visits him, what he eats and drinks, what books he reads, what conversations he has with his jailers or visitors, what coloured coat and nether garments he wears, and how he behaves when brought upon the scaffold. The penny-a-liner never ceases to take an interest in him while he lives; and even when he dies, he continues to gain a few days' subsistence by the after-anecdotes he rakes up about him, or his friends or connexions.—Cases of romantic suicides are also great helps to the penny-a-liner; steamboat collisions are strokes of fortune to him; the fall of railway stations gives him a lift; fires where great damage is done make the fire on his own hearth burn brighter; a great robbery gives him coin to count; and misfortunes and iniquities make him happy and prosperous.

Some penny-a-liners have circuits as extensive as the judges, and traverse periodically a certain district, narrating, in default of crimes and misfortunes, the details of parish squabbles, local elections, the appearance of the crops—anything that appears to them of sufficient public interest to warrant a paragraph. In some districts, the travelling penny-a-liner passes for a very great man, and receives no small attention, with good fare and free quarters, from inn and hotel keepers, from the hope that some day, in the Times or the Morning Chronicle, he will say a good word for the excellence of his accommodation, and the urbanity and good wines of the host—an expectation which the obscure penny-a-liner but rarely has an opportunity of fulfilling. He is also a person of some consequence with police-inspectors, whom he may have occasion in some future paragraph to designate as 'zealous and active officers.' Nor is his consideration less with parish orators; for if he cannot repeat their eloquence in full, he can manage to say in print that they delivered 'able speeches,' and that they were 'loudly and repeatedly cheered.' If the penny-a-liner of this kind have any faults besides his verbosity, it is his impudence. He has no scruples. A private house is not private to him; he lives by narrating incidents, and incidents he will have, at whatever sacrifice. It has happened ere this that the penny-a-liner has been ducked under a pump for his impertinent prying; that he has been left on a mud-bank by the indignant boatmen, for obtruding himself on the privacy of distinguished or royal personages in their own barge; and suffered various other like mishaps and indignities in the 'pursuit of knowledge under difficulties.' Nay, the penny-a-liner has been known to suffer indignity with a willing mind, and even with delight, if it would aid him to write a report for the morning journals which no rival penny-a-liner could have the opportunity of supplying. He has been known to put on the livery of a great family, and wait upon the

guests at table, napkin in hand, like any other footman, that he might gather the names of the distinguished guests, and describe their rich banquet next morning in the columns of all the journals. And when he could not do this by the connivance of the great man himself, he has bribed the butler, and been admitted as an extra hand for the extraordinary occasion. It is not often, however, that he is reduced to shifts like these; for the great man who gives a feast, or his great lady, is generally but too happy to have his or her magnificence duly emblazoned in the newspapers; and the confidential butler is instructed to treat the penny-a-liner well, give him all the particulars he desires, with meat and drink, and a fee into the bargain.

This class of penny-a-liners has been somewhat fattened of late by the progresses of her majesty to Scotland, and to the mansions of her nobility. Travelling in the wake, as it were, of the regularly accredited reporter of each journal, they described with painful minuteness every inch of her journey, giving facts, however small, wherever they could get them, and substituting surmises when facts were not to be obtained. No respect had they for royal privacy; and the colour of the royal gown or bonnet, or of the royal spouse's hat and hat-band, and shooting-jacket, were carefully noted from day to day—always with a view to the three-halfpences that were thus to be acquired. Every place that her majesty passed, or obtained even a glimpse of in passing, became of consequence immediately in their eyes; and its past history was raked up from county-books and other sources, and its present appearance described with all the minuteness of an auctioneer's inventory. All the deeds of all the ancestors of all the noblemen visited have also been detailed for the gratification of idle readers, and to the enrichment of the penny-a-liners, whose loyalty is ever most active when her majesty is active, and who love the queen the more she travels.

There is, however, a far larger class of penny-a-liners, who never move for business out of the limits of the metropolis, and who, enjoying there a beat of their own, might chance to meet with unpleasant resistance if they were to set a foot professionally in any suburban or provincial walk which a brother of the trade had, from use and wont, appropriated to himself. It is curious to note how, without authority, and solely by the prescriptive right of prior occupation and long usage, men of this kind have contrived to parcel out the metropolis amongst them, each man reigning supreme penny-a-liner and representative of the press in his own district, and taking charge of its news to the exclusion of every competitor. Some of these districts are very large, and some comparatively small. A few of them, in the neighbourhood of the Strand and Westminster more especially, are quite overrun with these literary prowlers. Each police-office has several hangers-on; every coroner is literally hunted by them from place to place; and every hospital is periodically visited by a shabby man, with a note-book and a pencil, to know who has been admitted with a broken leg. Every clerk of every parish is similarly favoured with a visitor, to know when the poor-law will next be discussed in the vestry—when the church-rate is to be proposed and opposed—or when the rector or the churchwarden is to have a new squabble with the parishioners. Generally speaking, the penny-a-liners of London may be divided into the following varieties:—the police-reporter, the fashionable reporter, the fireman, the accident and murder man, the inquest man, and the vestry man; with now and then a mingling of these various functions in the person of some more active and intelligent member of the fraternity.

The police penny-a-liner, by dint of perseverance in attending one particular police court, and furnishing to the morning papers accurate and well-written reports of the cases heard, contrives to establish himself in it, after a certain time, and becomes ultimately a person of some note in his little sphere. It must in justice be said of this class of London reporters, that by far the greater number of them discharge their functions

with great ability, and report very accurately all the cases of importance that are heard. With the sole exception of the wordiness, which is a consequence of the plan of payment adopted towards them [which may be deplored, but not easily remedied], they give no ground of complaint to any person of the manner in which they comport themselves. Sometimes, when an onslaught between the Munster and Connaught men, or any other Irish 'row' occurs, or a case involving any ludicrous incidents is heard, the penny-a-liner relates it with a talent and humour not surpassed by our best novel-writers; and police-reports are not unfrequently seen from the Mansion House of London, or from the Marlborough Street court, which would have excited universal admiration for their wit and style, and raised a reputation for their author, if they had appeared as part of a tale in three volumes. To their honour it should also be stated, that they are no flatterers of the powers that be. The magistrate, high and mighty as he is in his own court, has no authority over them; his nod inspires them with no awe; and if he is a man who gives arbitrary, contradictory, or foolish decisions, or utters absurdities, which is but too often the case, the penny-a-liner shows him no mercy. Without writing one sentence of his own, but merely by an over faithful kind of reporting, he contrives to hold up the peccant dignitary to the ridicule of the public. To the persevering exertions of one penny-a-liner of this independent class was solely owing, some years ago, the public outcry raised against a magistrate whose decisions were at variance with common sense, and whose tyrannical behaviour outraged all decency. Though his means of livelihood were at stake, though the magistrate was powerful, and though every means were employed to cajole or intimidate him, he held firm; and ultimately the lord chancellor sent the magistrate a gentle hint, that resignation was better than dismissal; and the hint was taken.

Another magistrate took offence at a penny-a-liner, who was constantly on the watch for the absurdities he might utter, and directed one of his officers to expel the offender by force. He miscalculated his own powers. A police court is an open one, and no magistrate has a right to expel any person who does not misbehave himself, or obstruct the administration of justice. The penny-a-liner, besides holding up this stretch of authority to the animadversion of the public, commenced an action of assault against the usher by whom he was thrust out; and the magistrate was ultimately but too happy to compromise the matter, and again give the penny-a-liner free ingress and egress to report what he thought proper. The latter, on his part, made no compromise, and continued the offensive reports; the most annoying part of the business to the aggrieved magistrate being, that it was impossible to say that they were inaccurate in any particular, however trifling; while they very dexterously made him appear ridiculous, by words which he could not deny that he had uttered.

In some of the remote police courts, where cases of no great importance are heard, the penny-a-liner finds it difficult to live on the proceeds of the few cases of interest that are worth insertion in the newspapers; and if he has a rival in the same court, his position becomes doubly precarious. He has, however, another source of income, less honourable, but by which it is well known that very considerable sums have been made. Mr Jones, or Mr Smith, or Mr Tomkins, for instance, has been brought before the magistrate for a street row, or a drunken frolic; and Mr Jones, Mr Smith, and Mr Tomkins, though persons of no consequence at all to the world, imagine that their disgrace will create a great sensation, if published, in all circles of society the following morning, and laid on the breakfast-tables of fifty thousand people. What is to be done? The penny-a-liner, as the representative of the press, is appealed to; and his promise of not reporting the delinquencies of the aforesaid Jones or Tomkins, is rewarded by such a fee as the fears or the generosity of Jones or Tomkins

will bestow. It may, however, happen that a case will occur which, from the peculiarity or importance of the circumstances, cannot be suppressed, and in which the penny-a-liner would lose more by not reporting for the newspaper than he would gain by the fee for suppression. How to please both parties is the problem which an ingenious penny-a-liner finds little difficulty in solving. Mr Brown of King Street, for instance, is the unlucky gentleman who is in the dilemma; and, for a consideration, Brown is transformed into Green or Black, and his abode is shifted from King Street into Queen Street; and thus all parties are satisfied: the public has the details of the scandal it so dearly loves; the penny-a-liner has his extra fee, and the feelings of the delinquent's friends, as well as his own, are spared by the mistake, which, after all, say they who are not in the secret, is a thing not to be wondered at in the hurry of reporting. The income of an established penny-a-liner of his class ranges, according to his ability, and the opposition from rivals of his own calling that he has to encounter, from £100 to £300 per annum.

The coroner's inquest man is a penny-a-liner of an inferior grade; though there are some able, honest, and intellectual men, worthy of better things, who are but too glad to resort to the coroners' courts for the means of subsistence. Generally speaking, however, they are men of little character, and of no attainments: some of them are not only ignorant of grammar, but even of orthography, and pass their time alternately in the workhouse, the gin-shop, and the jury-room. We have seen men of this class poorly clad, and the very pictures of misery and destitution, running behind a coroner's gig or carriage, through the storm and the plashing rain, to track him to the public-house where he was to hold his inquest; and keeping up with him too, in spite of the efforts of the driver to get in advance of them. At other times, a more respectable member of the fraternity has been honoured with a seat alongside of the coroner, who is in general happy when he can find a person of good attainments and decent character to record his proceedings. Besides penny-a-liners, who are merely discreditable from ignorance and low habits, there are vultures professing of this class, who are in fact not penny-a-liners at all, and who never wrote a line for a newspaper in their lives, nor could do so even if they tried, but who haunt the purlieus of every place where an inquest is about to be held, lured, like other vultures, by a dead body, and anxious to prey upon it by plundering the relatives and survivors. Wherever a suicide has been committed, there they swarm—numerous as midges over a pool, or as crows over carrion. A few instances, in which we shall not mention any names, though our facts shall defy contradiction, will suffice to show the mode in which their vile trade is carried on, and put the public on their guard as to their malpractices in future. It happened not very long ago that a gentleman of some eminence in his profession committed suicide in a fit of insanity. His partner in business was exceedingly anxious that the case should not be published, as it would hurt his own feelings, and the feelings of others who were dear to the deceased, and might, besides, do injury to his professional prospects. Then was the harvest of these harpies. They gathered round his house one after another, clamouring for money as the price of the suppression; and every applicant received his fee, for which he wrote a receipt, to convey to the mind of him who paid the money the impression that the transaction was fair and legitimate, and all in the regular way of business. They were cunning enough, however, in this case, as they generally are, to write the receipts in disguised handwritings, and in false names, to avoid the evil consequences that might ensue if the conductors of the morning journals ever heard of the circumstance, or thought it necessary to trace the scoundrels, who, by falsely representing themselves as connected with the press, had brought this disgrace upon it. The case was published after all. * *

Still more cruel cases have occurred repeatedly:

widows whose husbands have been lying dead in their houses, just after the commission of the last deed of insanity, have been visited by these prowlers, and money has been extorted from them in the very midst of their misery, as the price of the suppression of the details. The anguish of mind of a survivor is enough in these unhappy cases, without the additional pang that the promulgation of all the details for the satisfaction of a vulgar and prurient curiosity is sure to cause; and the self-called penny-a-liners of this class know the fact but too well, and trade upon it. It has been stated, upon undoubted authority, and we personally know the fact, that, to satisfy a demand of this nature, a heart-broken woman has taken the ring from her finger and the gold chain from her neck; and that the recipient having got his own share of plunder, has sent a companion as vile and as desperate as himself to try his fortune in extorting something else. Many similar or worse instances might be cited, if need were; for they occur every day, and the system has many ramifications; but enough has been said to enlighten many who were once ignorant, and perhaps to prevent much extortion for the future. While upon this part of the subject, it should be stated that the same persons, when inquests fail to supply them with the means of living, resort to the courts of excise, where publicans are fined for adulterating their beer, where they contrive sometimes to gain as large a fee as the Crown does a fine, upon condition of not publishing the name of the delinquent. Tradesmen who are fined for using short weights also swell the revenues of these pests of literature; but as the latter class of victims, however much they may be fleeced, excite little or no sympathy, no more need be said on this score.

Another class of penny-a-liners are the fire reporters, who generally undertake the accidents also; gleanings all their information of the first, that they have not themselves been able to attend, from firemen and insurance offices, and of the latter from the secretaries and surgeons of the hospitals. An active penny-a-liner of this class takes measures to be aroused from his bed at the first alarm of fire in any part of London, as effectually as the superintendent of a fire-engine station himself. Wherever there is a great fire, there is he in the thickest of the throng, gathering his materials for the next morning's paragraph; telling how 'the neighbourhood' of such and such a place 'was thrown into the utmost alarm and consternation by the discovery of an awful fire;' how 'the devouring element' raged in spite of the efforts of the firemen to extinguish it with the 'copious floods of water discharged upon it;' how the 'whole atmosphere was illuminated by the flames;' and how 'the inmates escaped almost in a state of nudity to the adjoining house.' Neither does he forget to state at the very outset of his story which engine of what office 'arrived first at the scene of conflagration,' and by what other engines 'it was speedily followed.' These are great points—in fact, essential points—on which rests the favour of the reporter with the insurance company—and some portion of his profits too, or common rumour has fallen into an error. Often will the adventurous penny-a-liner ride upon the engine with the firemen in its headlong course through the streets of the metropolis, and often travel twenty miles and back with them in search of the fire that throws a light upon the distant horizon; and all for a paragraph for the morning papers. In all weathers, frost, hail, sleet, or strong wind, he is to be seen with the moving multitudes of London; either with the firemen, or alone, riding or trudging on foot to the place of devastation; and gaining his honest and hard-won bread in the exercise of his useful though very humble function. Were all the penny-a-liners as honest as those who report the fires and the accidents, there would be no room to say anything against their character, whatever might be said of their style or attainments.

We have now to speak of a more clever and ingenious branch of the fraternity—the pure inventors, the

romance writers of the daily press, who palm off their romances as truths, and cheat the public of their sympathy for horrors that never occurred, and excite their admiration for remarkable events that have no other existence than in their own fancy. This is, however, a dangerous trade, and great caution and cunning, as well as imagination, are displayed by those who embark in it. Whenever an imposition of this kind is to be practised upon an editor, and through him upon the public, the penny-a-liner calculates his time. The papers generally pay on Saturday morning, and a fabrication of this kind, to be successful, must be sent round on Friday night; and if the editor is not on the alert, and confides in the accuracy of the very precise and circumstantial report of the awful catastrophe, or atrocious murder, that is sent to him, it is inserted in the paper of Saturday morning, and paid for a few hours afterwards, before any one has time to send a contradiction. Of course the fraud is discovered; but the penny-a-liner, who had written under a false name, cares nothing for that. He has received his three-halfpences, and when he has another invention of the kind to send, will send it in another name, and in a different handwriting; and, to allay the suspicion of the editors, will get one or two accomplices to write accounts of the same imaginary occurrence in other words, and with other signatures; and this being considered corroborative evidence of its truth, the false report is not unfrequently again inserted. Murders, duels, elopements, explosions, and romantic suicides, are the staple commodities of this kind of swindlers; and the very minute manner in which they relate their false stories, their mention of dates, names, and places, so very precisely and particularly, is calculated to disarm suspicion. It must not, however, be supposed that they have invention enough to carry on this game long. No: the annual register, and the files of newspapers fifteen or twenty years old, supply them with abundant materials; and an old murder of the times of our boyhood frequently comes before us again as a murder of yesterday, with merely the change of names and localities, but with all the original circumstances identically the same as before. Antiquated accidents are brought into the light of modern days by the same industrious and unscrupulous grubbers; explosions a quarter of a century old terrify us once more in a new burst of horror; and the romantic love tragedies of the days of our grandfathers and grandmothers are repeated—the scene being laid in Whitechapel perhaps, and the time shifted to the day before yesterday. There was a few years ago a penny-a-liner who was the most remarkable specimen of this class of men, who pursued his calling in the most open and unblushing manner, weaving original stories, so interesting, but so indefinite as to time, place, and name, as to defy contradiction; and so framed, that if they once got into a newspaper, they gave him no trouble to defend their authenticity.

There are some other divisions and subdivisions of the penny-a-line fraternity; such as those who attend boat-races, yacht-matches, cricket-matches, pugilistic encounters, and other real or miscalled sports. Formerly the horse-races used to be supplied by members of the same corps; but of late years this system has been altered, and there is a regular turf reporter, who supplies all the newspapers with sporting intelligence, and against whom all penny-a-line opposition would be fruitless. There are also penny-a-liners who loiter about at railway meetings, to pick up scraps of news, or interesting facts of any kind, to be woven into paragraphs, and who sometimes contrive to be of considerable service to the speculators in the line, by a short but judicious statement forwarded to all the editors, who are quick enough at detecting a puff in a paragraph of which insertion is requested as a favour, but who are slow to suspect it in the contributions of the regular purveyors of small news, to be paid for by the line.

It may be stated, in conclusion, that the five morning journals of London pay on the average about L.1000

a-year each for penny-a-line reports; and that, with the smaller payments made by the evening and Sunday journals, the penny-a-liners share among them about L.7000 per annum. What the dishonest members of the fraternity draw from the public by their extortions and frauds, cannot be so easily calculated; but from the repeated instances that occur in which large sums are paid for suppressions, the whole amount must be very considerable.

In this slight description, it is trusted that, although many things have been omitted, enough has been said to throw light upon the means of livelihood of a singular and important class of the community, whose numbers are few, but whose influence is great. The talent of some of them, and the usefulness of most, have been freely acknowledged; and if the veil has been lifted to expose the rogues of others, it has not been done for the satisfaction of mere curiosity, but to clear the high-minded and independent press of London from the aspersions that the malpractices of these false pretenders to a connexion with it have too often brought upon its character.

RESEARCHES IN ANIMAL ELECTRICITY.

Among the more prominent of modern scientific discoveries, stand the researches of Signor Matteucci of Pisa into the philosophy of animal electricity. His labours have gained deserved praises from men in the highest ranks of science throughout Europe. The Royal Society, the first of the learned societies of England, have awarded him their gold Copley medal, to mark their esteem of his contributions to the progress of philosophical knowledge. Signor Matteucci has verified and extended the experiments and discoveries of Galvani, first made known towards the end of the last century; and he has laid a foundation on which other philosophers may raise with safety a new superstructure of theory and investigation.

We shall endeavour to present to our readers, in as clear a form as the subject will admit, a brief review of the history and present state of the science, as contained in the work by the professor and his coadjutor, M. Paul Savi, recently published in Paris.

It appears that the celebrated Swammerdam was aware of the fact of the contraction of the muscular fibre when acted on by the influence of two metals, copper and silver; he performed the experiment before the Grand Duke of Tuscany in 1678, or nearly a century before Galvani announced his discoveries. To the latter, however, belongs the honour of developing principles; and as he was ignorant of the fact above cited, his reputation as a discoverer is in no degree diminished. It has been said that Galvani first noticed the contraction of the muscles by electricity in some frogs which had been prepared for cooking, and were lying on the table near the machine with which he was operating. Be this as it may, we find that, from the time of his first experiments in 1780, he waited eleven years in patient research before he gave them to the world—a distrust of his own achievements ever found associated with a high degree of genius.

The first phenomenon described by Galvani was the contractions in the limbs of a frog, prepared in the ordinary manner: as often as it was brought into communication with the earth and a conducting body, a spark was drawn from the machine in proportion to the distance of the frog from the conductor. In continuing this experiment, he subjected a prepared frog to the passage of the electricity of the atmosphere, when he discovered that this little animal is the most sensitive of electroscopes. It is with a feeling of dread that we read of his grasping between his hands the isolated column of an atmospheric conductor at the instant of the discharge of lightning from the clouds, in order to try the effect of the atmospheric current on his own person. Galvani ascertained that the contractions took place when the extremities of a circle, formed of two different

metals united together, were applied, one point to the nerve, and the other to the muscle of the frog: from this and other experiments he deduced the existence of an animal electricity, or a *nervo-electric fluid*, which he supposed to reside condensed in the interior of the muscle. According to his theory, the nerve was but the conducting medium for the discharge of two kinds of electricity contained in the muscle; the direction of the current being from the latter to the former. He found also, on further research, that on touching the nerves of a prepared frog at two different points with a piece of muscular substance taken from a living animal, the same contractions were excited as when a metallic agent was employed.

This philosopher was followed in his inquiries by Volta, who, in pursuit of the same subject, first discovered, in 1796, the electricity developed in the contact of two metals; from which arose the discovery of the Voltaic pile, a discovery whose influence on other sciences has only been equalled by the rapidity of its spread. The famous Humboldt, among others, directed his attention to this science; and to him are we indebted for the discovery of the action of the electric current in the pulsation of the heart, and the natural movement of the intestines: he also, with the courage of a devotee of science, removed several portions of his skin, by means of blisters, in order to carry out his experiments on parts beneath the surface. The philosopher Valli, in the course of his experiments on the same subject, observed that, on tying the artery of one of the limbs of a living frog, the power of contraction was soon after destroyed, and that the nerves are less sensitive at their roots than at their extremities.

Later research has not changed the results of the earlier investigators, but has confirmed, in most instances, their views and experience. Professor Matteucci has cleared up many of the doubts under which this science was obscured, and established the laws of muscular contraction. He has constructed a 'pile' or 'battery' of the hind quarters of frogs placed alternately in line on a board; and found, by the indications of his galvanometer, that the force of the current rests on no uncertainty, but depends entirely on the number and vicinity of the frogs killed for the occasion, the direction of the current being invariably from the interior to the surface. The same effects were produced with portions of an eel, from which the skin had been stripped, when properly disposed on the board. Living tenches were taken, and after being skinned, slices were cut from the muscle down the whole length of the back of the fish; these slices, when cut into pieces, and arranged as in the preceding examples, were found to cause a similar disturbance in the galvanometer, while the direction of the current was precisely the same from the interior to the surface. The results were identical when the experiments were tried on warm-blooded animals; with the muscles of the legs and the hearts of pigeons, of fowls, sheep, and oxen. These experiments constitute a fundamental result, that, without exception, whenever the interior of the muscle of any animal recently killed is brought into contact with its surface, an electric current is found to pass from the former to the latter, varying in intensity in different animals, proportionately with the number of muscular elements disposed as a pile, and ceasing entirely in a short period after death. The higher we go in the scale of creation, the feebler are the developments of the electric current. Of three piles composed of an equal number of limbs of frogs, pigeons, and rabbits, the power of the first was as 22 to 14 for the second, and 8 for the third. In an hour after, all indications of electricity had totally disappeared in the rabbit pile, while that of the pigeons was as 3 to 10 for the frogs, which, even after the lapse of twenty-four hours, still gave some signs of contractility. Subsequent experiments, however, led the professor to infer that the intensity of the muscular current in animals increases in proportion to their rank in the system of nature.

It appears that there is no change in the force or direction of the muscular current even when the integrity of the nervous system is destroyed. Signor Matteucci verified this by a very cruel experiment: he passed a red-hot wire into the spinal marrow of six frogs, exactly at the lower vertebrae; the frogs immediately lost all movement and sensation in their hinder extremities: they were then replaced in a vessel of water with six other frogs in their natural vigour, and after four days the whole were killed, and two piles prepared. On trying the respective piles by the galvanometer, it was ascertained that the greatest force was derived from the frogs whose limbs had been paralysed by the heated wire; a result attributed to the consequent inflamed state of the muscles, but which proves the electric action to be independent of the nerve. In order to ascertain the effect of the electric current on central portions of the nervous system, the skull of a rabbit was trepanned, so as to expose the brain: the first contact was then made on the two cerebral hemispheres, but without any movement on the part of the animal: the same result was obtained when the current was passed through the cerebellum: but when the two poles of the pile were applied to the base of the brain, the rabbit uttered loud cries, and was seized with violent contractions of the whole body.

These results, as Matteucci observes, are far from proving the existence of *free* electricity in living animals. It is equally well proved that the signs of the current found in muscular masses exist independently of the integrity of the nervous system, and even after this system has ceased, although irritated, to excite contractions. For the production of this current, the organic arrangement, which constitutes living muscular fibre, is as necessary as the action which maintains it in that condition. Is it not natural to suppose that the nutrition, such as is proved to take place in the muscle, and in all parts of living bodies, develops electricity? It would be difficult not to admit it. In fact, it is well known at the present day that the action of the oxygen of arterial blood is felt in every part of the living body, that the whole organised system is constantly renewed, and that a species of combustion always accompanies this renewal, with a development of carbonic acid, and a loss of heat. Is it right to suppose that such a chemical action takes place without the production of electricity? Muscular fibre may represent a plate of metal, and arterial blood the acidulated liquid. The surface of the muscle, or any other conducting body which is *not* muscular fibre, may represent a second metallic plate, serving to complete the circuit. The natural direction of the muscular current is such as would arise in the muscle under a chemical action as here described.

The sum of the series of experiments proves that the electric current alone has the power, according to the direction of its action on a nerve, of exciting separately contractions or sensations. When this current is long-continued, no effect is produced; but it may be again excited on passing the current in a contrary direction; and this current is that which possesses the power of arousing the excitability of a nerve, however weak it may be, above all other stimulating agents. These conclusions in turn prove that the mode of action of the electric current on the nerves is in some degree analogous to the unknown force which calls the nervous system into play.

The circulation of electricity in the nerves cannot be admitted, without supposing such an arrangement in the structure of the nervous system as would be necessary to form a complete circuit. The labours, however, of the German anatomists, remarkable as they are, are far from proving satisfactorily the existence of such an arrangement, especially in its ramifications among the muscles. In all the experiments made on the nerves of living animals, even when the whole extent of the nerve has been brought to the test, no evidence of native electricity could be produced.

The electric muscular current is a phenomenon, as has been shown, which may owe its origin to the chemical action constituting the nutrition of the muscle. It has also been established that this current, strictly analogous to that produced by the combination of two bodies, exists only in the molecules, and never circulates in those media but in particular cases, which were realised in the experiments only by experience. The nerves have no direct influence in the existence of this current, and have no other power than that of a bad conducting body communicating with certain portions of the muscle.

What is, then, this mysterious moving power? According to the hypothesis of Professor Matteucci, it is identical with that which appears in heat, light, and natural electricity. There exists in animals such a structure, or disposition of certain parts of their organisation, that, by the act of the unknown force of the nervous system, electricity is set free. Either exists in diffusion in every portion of the nervous system, as in all the matter of the universe, which in this system may have a particular arrangement. When the organic molecules of a nerve are disturbed by any cause, the ether, or more properly the nervous fluid, is brought into a certain movement, which, if directed from the extremities towards the brain, produces a sensation; but, on the contrary, excites a contraction when the direction is from the brain to the extremities. Philosophy is advancing daily towards a greater simplification of its hypotheses, or, more properly, towards a single hypothesis, which will explain all the phenomena of heat, light, and electricity. What hypothesis, indeed, is more worthy of the rank to which efforts are being made to elevate it, than on a matter which is susceptible of so great a number of different movements, capable of transforming one into the other, and thereby representing very various phenomena. The most essential characteristics of this matter, such as the immense rapidity of the propagation of its movements, a certain intangible materiality, its transformations, belong to the unknown power of the nervous system, as well as to electricity, light, and heat. The relation between these operations of the ether become much more intimate when not only one can be transformed into the other, but when this, in its turn, can be transformed into the first.

The great object of Signor Matteucci, through the whole course of his experiments, appears to have been the relief of human suffering, and we shall now notice his observations on electricity as a therapeutic or curative agent, which he tells us has been applied by practitioners with a blind confidence, or treated with discouragements equally inconsiderate. Instantaneous or general cures were not to be expected; and this means should not have been employed empirically, or without proper study and knowledge of electro-physiology. It is certain that electricity may be wisely applied in nervous affections, and in cases of total or partial paralysis; and, acting on the results before noticed, as a paralysed limb is in the condition of one which has lost its powers by the passage of a continued electric current, the current must be passed in the contrary direction; regard being had, however, as to whether the paralysis be of motion or sensibility: the former requires the inverse current, the latter the direct: but in a case of complete paralysis, there is no reason why the direction of the current should not always be direct. Another rule to be observed in this application is, that the passage of the current should not be maintained for too long a period, as the risk of increasing the malady would, in such a case, be incurred. The more intense the current, the shorter should be the time of its duration. The intensity should vary with the degree of the disease, and the currents be passed for two or three minutes, at intervals of a few seconds; after these two or three minutes, during which twenty or thirty shocks may have been given, the patient should be left to repose before repeating the treatment.

A Voltaic pile of 100 pairs, or an electro-magnetic machine, may be employed in these remedies, which it

would be desirable to accompany with puncturation by needles, in order to carry the current as near as possible to the paralysed nerve. Great patience is required in this mode of treatment; in some of the cures effected by Marianini, the applications were continued through several months: in two cases the cure was only complete after 2500 electric shocks had been given to the paralysed member. Among other cures are several by the celebrated Magendie of Paris: and at Pisa, the professor was a witness of the cure of a man, whose lower limbs were completely paralysed, in the hospital of that city, effected entirely by means of electricity and acu-puncturation. These results, though few in number, will perhaps suffice to induce physicians to make a serious study of electro-physiological phenomena; and to succeed by persevering efforts, which science will enlighten, in the employment of a curative method, peculiarly adapted to the removal of a class of complaints which unfortunately too often resist all other remedies.

Another affection for which the application of electricity has been proposed, is tetanus, on which, in the human subject, Signor Matteucci has been the first to make a trial. He noticed that frogs suffering under the effects of narcotic poisons, such as opium, nuxvomica, &c. were at first stupified, then over-excited, and, shortly before death, were seized with violent tetanic convulsions. If, while in this latter condition, an electric current of a certain continuous strength was passed through these animals, the rigidity of their members and the spasms were seen to disappear. The frogs died from the effect of the poison, but without exhibiting any signs of tetanus. The trial was made on a man suffering from an attack of this malady, in consequence of an injury of the muscles of the leg, and during the passage of the current the severe spasms abated: he was able to open and shut his mouth; and the course of the circulation and the perspiration seemed to be re-established. Although this first experiment was not successful in saving the man's life, it has brought to light a means of mitigating the severity of a very painful affection.

The patience and perseverance of Professor Matteucci have been proportionate to the great objects of his pursuit: he tells us that he has published no statement which has not been verified by repeated and scrupulous experiment. His work is written in an easy and unassuming style, and its clearness is such, that every person may, to use his own words, 'place themselves in a condition to repeat and add to the experiments.'

Science is a severe mistress, and they who devote themselves to her cause must divest themselves of some of their finer sensibilities. It is impossible to read of the destruction of thousands of frogs, besides other animals, without a shudder. This forms a serious drawback to the interest excited by Matteucci's experiments. Humanity to 'those that creep and those that crawl' is oftentimes too little thought of; yet without it, genius loses half its lustre. In the present case, however, the end may be said, in some degree, to justify the means; and if human suffering can be alleviated, we may overlook the cruelty in the compensation.

HEART.

THERE are some persons in the world who are special favourites among all who know them, who find or make friends everywhere, whose company every one enjoys, and from whom every one is loath to separate. Their frank and easy manners inspire confidence at first sight, and one numbers them as friends almost as soon as one has made their acquaintance. No one is ever 'not at home' to them; their visit is anticipated as a pleasure, and no one feels disposed to part with them without the cordial inquiry, 'When shall we see you again?' There is an exuberance of pleasurable life about them which seems to diffuse itself among all around, and their presence is felt to be an addition to the general amount of happiness in the circle privileged with their company. In selecting a party of friends, their name always comes

gests itself first, and the absence of any two others would be a less disappointment than theirs. Every one seeks their side at the dinner-table, and he deems himself fortunate whose chair in the social circle is next to theirs. Innocent childhood loves to sit on their knee and prattle its earnest nonsense in their ear; impetuous youth finds in them cordial companions; and old age values them as pleasant and estimable friends. And yet it is not to their personal comeliness that they are indebted for this popularity, for their exterior is often far from prepossessing; nor to their intellect, for even their best admirers do not imagine them Byrons, nor do they themselves turn down their shirt-collars to be thought such. They have no remarkable vein of humour to boast of, never made a pun, perhaps, in their lives, scarcely know what an epigram is, are quite incapable of setting the table in a roar, and are distinguished neither for their fine clothes nor their long purses. One quality, however, they possess, which proves an over-match for every other distinction, namely, a transparent kindly nature, a desire to promote the happiness of all around them, a generous warmth of feeling, a frank cordial bearing, a universal sympathy—in one word, 'heart.'

It's refreshing, amidst the cold conventionalisms of the world, to meet with these men of 'heart,' or to see in any one developments of naturalness. He must be a misanthrope, indeed, who can witness without pleasure the hearty shake of the hand of two friends at an unexpected meeting after a long absence. What a mutual pouring out of soul, as it were, is there on both sides! What an infectious gladness is that which beams on their countenances! Who has not, with a fine chubby little fellow seated on his knee, listened with delight to his enthusiastic narration of some trivial incident which has been engrossing his interest? How his meaning sparkles in his full eyes, and struggles for utterance in his speaking features! What clumsy dull things words seem, to express those intense feelings which are welling up in his heaving bosom! What a charming development of 'heart' is there in that lisping eloquence! Who, again, has not felt charmed at the sight of an aged man romping with a child, and entering heartily into the sports and feelings of youth? Who has not admired the verdant old age of such a one, his feelings, unchilled by the freezing influences of threescore years and ten, still fresh and glowing as in his childhood; who has neither become so falsely wise nor so sourly proud as to disdain the sports and pleasures of his youth; and who, while he has learned to think as a man, has not forgotten to feel as a child? Who has not been gladdened, amid the monotony of the crowded street, with some manifestation of 'heart' in the sincere though perhaps awkward gallantry of some rough impetuous Irishman, in his efforts to succour helpless childhood or timid womanhood; or the powerful expression of natural feeling in some unsophisticated tar, vulgar perhaps in the estimation of ordinary beholders, but pleasant and refreshing to those who value the unrestrained utterings of nature beyond the mere tinsel affectation of art? Even among the lower animals, it is also observable that those in whom this quality is most apparent are our greatest favourites. The peacock, with his rainbow hues, and his magnificent train, excites in us but very cold emotions compared with those we experience at the sight of a robin on the hedge-top, or even the sober-suited sparrow in the garden. There seems to be a 'heart' about them of which the vain fox is destitute; the one we cannot refuse to admire, but the others we cannot do less than love.

This quality of 'heart' commends itself so powerfully to every one's best feelings, that its development is pleasing even to the most stoical, and needs only to be seen to be imitated. It is singular to observe sometimes the changed behaviour of the sons of pride and fashion in the presence of a man of 'heart.' How strangely will fashion forget its effeminate lipings, and blush for its own squeamishness, ready to forego the applause even

of its butterfly circle, to hang upon the lips, and bask in the glad honest countenance, of one who is a disciple of nature! How out of love will it seem with its own sickly insipidity, how desirous to emancipate itself from the iron tyranny of its bondage, as it contemplates the moral robustness of one who dares to be natural! How uneasy often is bloated pride at its own fancied superiority, and how insensible, in spite of itself, will it change its freezing loftiness into affability in the presence of one whose manly independence of character and bold naturalness contrast so advantageously with its own hollow arrogance! How forcibly does every look, every expression, mirror forth to the proud man the unnaturalness of that character which he has unhappily assumed, and render him more pleased with the society of his warm-hearted companion of the hour than with that of his ordinary frivolous and heartless associates.

It is to be regretted that, in the education of the young, so much is done towards discouraging the natural manifestations of 'heart.' No sooner is the child able to understand, than it is taught not to make free with the servants; it must not associate with other children unless they are very 'respectable'; it must not laugh above a certain standard of loudness; and must obey a thousand other conventional laws which tend only to destroy naturalness in character, and substitute cunning, hypocrisy, pride, and a host of other hateful pests to private peace and social harmony. As the boy grows older he becomes still more artificial, frightened, as it were, at the shadow of his own feeling; he is taught to despise whatever is common, to hate what is vulgar; and that self-respect which, judiciously encouraged and wisely directed, might have been of the greatest use in inducing a becoming spirit and preserving from debasing pursuits, is pampered up into an arrogant and offensive pride. The public school completes the vicious education; the manly is forgotten in the 'gentlemanly'; honour, morality, duty, are words only used as texts for witless jokes; the stream becomes more contaminated as it recedes from the source; the youth grows older only to grow worse, and the dew-drops that gemmed the morning of life are

'Parched and dried up in manhood's noon.'

The confiding trust, the truthfulness, and the uncalculating generosity of youth, soon merge into the cold suspicious selfishness of manhood; the head is disciplined at the expense of the heart; and the boasted wisdom of age is but a poor substitute for that freshness of feeling which it was unhappily the first effort of education to discourage and eradicate.

To the manifestation of this quality some of our most favourite authors and poets chiefly owe their almost universal popularity. This has made them writers and poets for the mass, and rendered their thoughts and words familiar with all who read and think. Shakespeare, Goldsmith, Cowper, and Burns, stand conspicuous for the development of 'heart' in their writings—and whose writings are read more extensively, or retain more powerfully their hold on our affections and memory? Others, with acknowledged genius and undoubted learning, have a while glared, meteor-like, upon their wondering fellows, but they only dazzled the blinded eye for the passing hour; their light was rather the cold and lifeless radiance of the moon, than the warm life-giving brightness of the sun, and they have consequently been unsuccessful in gaining the affections or even the prolonged attention of the mass. To this cause, also, must be mainly ascribed the popularity of some of our musicians and ballad composers. Here consists the principal charm of Dibdin's songs—there is so much 'heart' in them; they vibrate upon the feelings, not of this or that conventional class of persons, but in the breast of common humanity. They are grounded upon the broad base of human nature, and consequently retain their hold on the affections of the people, while productions fully equal to them in musical and poetical

merit have long since been forgotten. Here is the secret of the great influence which some preachers and senators have exerted over their hearers, and to the want of this quality must be mainly ascribed the little impression often produced by even the most laborious harangues. This is the leverage so powerful in the hands of the singer, and especially of the actor, and by which they call forth the smiles and tears of their audience at will.

In the female character, this quality of 'heart' is often seen developed to admiration, and where it exists, is more charming, and frequently proves more attractive to the other sex, than either beauty of countenance or symmetry of form. Though coupled with plain features, how often do we see those who possess this quality pair off into the matrimonial list before the handsome and the accomplished! How often, even when the rubicon of the 'teens' has been long passed, do we see one of these agreeable women, with her pleasure-diffusing smiles and animated manner, contrast with the greatest advantage with the lifeless insipidity and the haughty pretension of the merely beautiful and intellectual around her! And even when ruthless Time has bleached her flowing locks, and paled her roseate cheek, yet a woman with 'heart' is always a delightful companion, to be loved and honoured; there is still an atmosphere of joyous love around her; her years are undated; we miss not youth and beauty; we see no defects; the *tout ensemble* is loving and loveable; and young and old are alike charmed by her. Her cheerful smile, her sympathising look, her thousand kind offices—too minute to be described, but not too minute to be appreciated—so gentle, so unobtrusive, are all developments of 'heart' which insinuate themselves around our purest affections, and commend themselves to the affectionate admiration and reciprocation of the sterner sex.

LEGEND OF A FRENCH COOK.

A TALE OF THE FIFTEENTH CENTURY.

HISTORY supplies us with a rule to which there are very few exceptions. Both ancient and modern annals show that the eldest sons of kings reverse the order of nature, and are, very generally, their parents' opponents. Such was the case with Charles VI. of France, who, though so much beloved by his subjects as to be called *Le Bien Aimé*, had, in his eldest born, a rebel and a traitor. This undutiful son, however, on coming himself to the throne, was destined to feel a full measure of retribution. After having regained his kingdom—which the English, partly by his early treasons against his sire, had contrived to acquire—and settled down to enjoy his conquest in quiet, he found in his eldest son so bitter an enemy, that there was no crime which he believed the dauphin would not be guilty of to get rid of him. Hence the latter years of Charles VII. were spent in a constant dread of his son's machinations. The dauphin, knowing this terror to exist in his father's mind, took full advantage of it, and originated an unfounded report that his majesty's life was menaced. These rumours, artfully spread, were at first vague and indefinite. Presently they gained strength, and were conveyed to the ears of the king through so many different channels, and accompanied by so many apparent corroborations, that the unhappy monarch lived under the horrible expectation of being made the victim of certain slow but deadly poisons.

In proportion as the terrors of the king were manifested, so the insidious rumours gained strength and probability, until the majesty of France was brought to a state of existence like that of Tantalus; for, though surrounded by profusion, he dared not satisfy the cravings of hunger for fear of poison. His mind was a prey to suspicion. He looked on those courtiers whose duties brought them near to his person as a set of conspirators,

sworn to put an end to his existence, and wondered each day which of them it was who had been selected to introduce the terrible drugs into his food; for, amidst all this misery, he was blessed with one gleam of satisfaction—the court cooks were incorruptible, and he knew that his death would never be compassed in the kitchen. But he dreaded his upper servants with an intensity that was likely to bring about the unusual catastrophe of a powerful king dying of want. After, however, some consideration, he hit upon a plan for obtaining his meals, which the unimpeachable fidelity of his cooks rendered practicable. There were four of them—the brothers Taillevent—descendants of an illustrious line of cooks, who had roasted, boiled, and fried for the royal family of France for three generations. These he distributed in his four domestic establishments at the palaces of Fontainebleau, Compiègne, Vincennes, and Beauté-sur-Marne. To one of these confidential cuisiniers he daily sent, by a trusty and secret messenger, a head of living game—but to which of them, was kept a profound secret from his court. The destined food was always accompanied with a letter of instructions as to how and when it was to be cooked. So scrupulous was he, that the royal epistle was sealed and directed (by the superannuated minister Tanneguy Ducâtel) in the writer's presence. By this contrivance no one ever knew where or when his majesty was going to dine—not even the selected cook himself—till a few hours before the king appeared to partake of his meal.

While his majesty was suffering from the tormenting dread of poison, the whole of Picardy rang with the miracles said to have been performed upon the sick by the medical skill of a monk named Didier, by his preaching, and by certain relics of St Bernadin, of which he was the fortunate possessor. During the Lent of 1454, this wonderful preacher was seen at Péronne, followed by twenty thousand proselytes, ten thousand of whom were cripples, and performed their discipleship on crutches. The grand object which he professed was, to reform the order of St Francis, by introducing the rules or 'observances' bequeathed by St Bernadin of Sienna (a recently canonised saint), and with the alms he collected from the sick and the pious, to found, build, and endow several new convents. Notwithstanding, however, all his popularity, and the potency of the relics he carried about, he was unable to collect sufficient funds for his purpose, and determined to apply to the king for assistance. Accordingly, on one of the earliest days of July, in the year of grace 1461, the monk, being in the neighbourhood of Fontainebleau, determined to look in upon his majesty, and endeavour to excite in him a holy zeal for his project. It happened that the king had dined there the day before; and brother Didier was fortunate enough to be granted an interview. The monk's fame for extraordinary sanctity had already reached the monarch's ears, and he was anxious to see a person whose object was to spread the rigid discipline and observances of the rigorous St Bernadin.

When Didier was announced, the half-starved monarch thought to have beheld a figure emaciated with penance and wan with fasting, who would be able to sympathise with him on the subject of abstinence. The monk entered, and the king almost started from his seat to behold a portly, plump, rosy-cheeked individual, who bore all the outward signs of an indulgence in the good things of this life, which his patron saint so strictly prohibited, and against which he himself so vehemently preached. Having, to give himself the greater ease, loosened the cord which confined his robe around his ample person, brother Didier, with a degree of self-possession much at variance with the humility imposed by the famous 'observances,' explained in detail all his plans regarding the new religious houses. His conversation was insinuating, and he plentifully mingled with it the sign of the cross. 'My dread sire,' he said, 'permit me to remind you that my most holy and blessed master, Bernadin of Sienna, having been by the papal court appointed vicar of the observance of St Francis to

the Italian States, introduced his reform into three hundred religious establishments of that order during his lifetime. May the saint and your august majesty aid me in introducing the same reform into the twelve or fourteen monasteries and convents it is my sacred wish to found.*

The politeness of Charles the Victorious induced him to listen to the long-winded harangue, which was concluded as above; but it was quite evident he was thinking of something else. This was proved by the irrelevancy of his answer. 'You have, holy brother,' he remarked, 'made yourself famous for your skill in pharmacy. Pray, amongst your collections of drugs and simples, have you any antidotes?'

'Against what, an it please your illustrious majesty?' 'Poison,' replied the king with a shudder.

The gray eye of the monk twinkled beneath his bushy and downcast brows. He saw in this question a promising perspective of patronage and alms. 'My beloved seigneur,' he replied, 'I have preventives and antidotes for the most deadly poison that ever sprung through the earth from the lower regions (from which may Heaven in its mercy exempt your supreme highness), provided those who need them be filled with faith; and,' continued the wily monk, casting his eyes on a schedule of his monastic plans which he had placed before the king—'and provided they liberally engage in good works.'

The quick comprehension of Charles immediately saw the drift of the suppliant. The price of the antidote was to be a liberal contribution of cash and patronage; and from that moment he condescended to enter with warmth and zeal into a discussion of brother Didier's building schemes. In return for this, Didier promised his majesty a valuable relic, consisting of a bit of St Bernadin's robe, 'which,' said the monk, 'will protect your grace from the deadliest of poisons.'

The king accepted the promise with eager delight, and it was with some difficulty that Didier could get the conversation brought back to the patronage and alms. At length he succeeded.

'And as to the proposed monastery, it shall be established under our royal sanction as soon as may be. To-morrow,' continued the king, 'I—' here he suddenly checked himself, and, looking steadfastly at the monk, asked if he could trust him. 'With your life, sire,' was the loyal answer. 'Then,' said his majesty, 'I will confide to thee a secret.'

'It shall be kept as sacredly as the holy relics of St Bernadin,' replied the monk.

Charles looked round to see that no intruders were there, and said, speaking in the monk's ear, 'To-morrow I dine at my palace of Beauté.' It was some time before Didier could discover that *this* was the important secret; but when he was assured of it, he made fresh protestations of fidelity. 'Thither,' continued the king, 'do thou repair, and we will confer more fully on thy projects. Meantime I will furnish you with a letter to my father confessor. Wait here till it be brought.'

Charles retired to an inner room, occupied by his confidant and secretary, Ducâtel. As he had to despatch his dinner for the morrow to his cook, he sat down to write to Taillevent, with, as was usual, his own hand. The second letter to the father confessor at Beauté (Jean D'Aussy, almoner of France, and bishop of Langres), which Didier was to take, being of far less importance, he merely dictated to Ducâtel. The epistle to the cook ran thus:—

'Master Taillevent, on pain of death, be secret! It is my royal will that to-morrow—which will be Thursday, the day of St Loup—I shall sup at my chateau of Beauté. To this end I send you the accompanying live game; and you will kill it about an hour after sunrise. In the dressing and serving thereof, you will eschew the use of rose-water, verjuice, milk, ginger-wine, marjoram-sauce, salt, butter, or other things which may have been adulterated out of the kitchen; for I know that the

wicked poisoners are again conspiring against me. Such is our royal will: whereof fail not. CHARLES.'

Didier's letter of introduction to the royal almoner, then staying at Beauté, was as follows:—

'Messire Jean D'Aussy, I send you a holy person whom I love and esteem; do not be surprised. I desire that he be hospitably entertained by you in my chateau of Beauté with all honour and the greatest secrecy. I have high and mighty designs in reference to this noble bird, who seeks to build a holy nest for the faithful. May Heaven preserve thee in health. CHARLES.'

His majesty's haste to despatch Didier, and to ratify the bargain for the relic, was very great, and the old secretary was so flurried, that he sent an equerry with a caged bittern to the bishop of Langres, and accredited the monk to Monsieur Taillevent, the cook.

The right reverend the father Jean D'Aussy, bishop of Langres, and confessor to Charles the Victorious, was seated at his studies in an apartment of the chapel-ward of the palace of Beauté-sur-Marne, when the equerry appeared bearing in one hand a letter, and in another a cage. On seeing that the letter was sealed with the *fleur-de-lis*, which no hand but that of his majesty was allowed to impress, the confessor hastened to open it, and to devour its contents, in which, however, he was much interrupted by the fluttering, screaming, scratching, and biting of the prisoned bittern. He could scarcely believe his eyes; he looked at the letter, and then at the occupant of the cage, and asked the equerry if he were sure no human being accompanied him. The reply was, that his only companion was in the cage, and an extremely troublesome one he had proved. 'Was this the holy person? Impossible!'

A little reflection, however, brought an inference into the priest's mind, which he feared would be disloyally expressed in his countenance, and telling the messenger to set down the bird, he bade him retire. Jean D'Aussy then re-read the missive, in the hope of proving to himself that his royal master was *not* insane, and began a series of erudite reflections concerning the sanctification of animals. He remembered the bird Ziz, spoken of by the Rabba Bar Bar Channa in the Talmudic legends, and also the sacred cock, which is said to have saved the life of the prophet Akeba; but as these were, he verily believed, traditions of most suspicious origin, he rejected them as evidence in favour of the holiness of the winged wretch before him. He carefully turned over in his capacious memory the writings of all the Christian fathers, but could not find any warrant for the sanctification of either eagles, cocks, or bitterns; at length he could resist the unpleasant inference no longer, and came to the painful conclusion, that continued fasting had turned the king's brain. Still he dared not disobey the will of his liege lord, and proceeded to entertain the 'holy bird' hospitably, by thrusting from time to time some crumbs of bread between the bars of the cage, at the imminent risk of his fingers.

The eve of the festival of St Loup, in the year 1461, was excessively hot, and while Father D'Aussy was suffering from this perplexity, the illustrious* Taillevent, who had the honour of presiding over the kitchen of Beauté-sur-Marne, paced up and down his dominion, wearied of having nothing to do, and so thirsty that he was obliged to recruit exhausted nature occasionally with huge draughts of hypocrâs and spiced wine. Ever and anon he reviewed the shining pots and pans, ranged in rows along the walls, with the pride of a general sur-

* We use this term advisedly, for the head cook to Charles VII. is a historical personage; and as the history of cookery forms a part of the history of France, several notices have been preserved of him. He is most celebrated for being the earliest author on the subject of his art since the invention of printing. Several years after the events recorded in the above historiette, he gave to the world a concise and learned treatise, entitled 'Vianier pour appailler toutes manières de viands, que Taillevent, queux de roy nostre sire fist, tout pour habillier, est appailler bouilly rusty,' &c. (The way of dressing all manner of meats, as practised by Taillevent, cook to our sovereign the king, &c. &c.) This was one of the earliest works which was printed from metal types in France.

veying his forces, and with something of his regret in times of peace, when no use could be made of so fine an army. 'By the feasts of St Boniface,' exclaimed the corpulent kitchen-man, 'things were not thus in the time of Charles V. of blessed memory. In his day the royal hearths *never* cooled—not even in ember weeks or vigils. But now our chicken-hearted king, his grandson, fasts like a hermit! And when he does eat, it is something hardly worthy of a beggar's wallet; some tough crane or old bittern, or anything his gamekeepers choose to send him alive. Possibly to-morrow he will send me a wild boar, or a rhinoceros, to be served up for the royal digestion.'

While he was thus soliloquising in the dusk, something nearly as large as the animals he had mentioned entered the apartment. On perceiving the apparition, the cook's first instinct was to seize the cutlass-like knife which was stuck into his girdle, to exercise his office on the beast, which, by some supernatural agency, had, he imagined, seconded his thoughts. As, however, he perceived, on closer inspection, that it stood upon two legs instead of four, and that it could speak, he was convinced that he had made a mistake.

'Are you Master Taillevent?' inquired our friend the Franciscan monk, reading the superscription of the epistle.

'I am,' replied the cook, sheathing the knife. 'What is your will?'

'Read this and you will learn,' returned Didier, surprised that the king should have commended him to a man of such humble station. As the cook read the royal missive, the monk watched his large, dull, inexpressive features, endeavouring to glean from them some clue to the mystery. 'Well,' asked Taillevent, folding up the letter, and tucking it inside his belt, 'where is the game—the bird?'

The monk's surprise increased, and observing a twinkle in the cook's eye, he thought he could perceive the germ of a practical joke which was being played upon him. 'A bird?' he echoed. 'Hark ye, Master Sauce-maker, if any one presumes to shoot jests at me, let him understand it will be jeering the head of the church, seeing that I am the representative of his holiness.'

At these words a thought entered Taillevent's head which somewhat troubled him: he re-opened the letter—read it carefully again. 'By the crock of St Andouillard,' he muttered to himself, 'am I to be degraded from the office of master-cook to that of butcher or executioner? Yet the command is as plain and express as it is terrible. Tell me, reverend father,' he inquired aloud, to make himself quite sure, 'have you really brought no animal or bird, wild or tame, for me to cook?'

'Forsooth no, Sir Jester; I bring nothing but your royal master's command to treat me with all hospitable courtesy; forasmuch as in me you behold the patron of the order of the observance, and possessor of the relics of Monsieur St Bernadin of Sienna.'

The small eyes of Monsieur Taillevent were turned towards the speaker, and he gazed on Didier with the critical scrutiny he usually employed on surveying a fatted ox or pig. 'Alas, alas!' he exclaimed, slowly shaking his ponderous head, 'my holy victim, say your paternosters—make your private supplications—you have only till an hour after daybreak to-morrow for this world. This way if you please!' The cook, with a doleful countenance, conducted Father Didier into a buttery with nearly the same feelings that would have possessed him on driving a fat ox into the stall of a shambles. The monk entered willingly enough, when he perceived in the small apartment two things which comforted his inner man—a couch, and a rich collection of eatables; for he was both tired and hungry. The strange words and manner of his host, however, gave him some very uncomfortable presentiments, and these were much increased when the door was closed, and the key turned upon him. 'A person—a servant of the church too—under the king's protection,' he

exclaimed, 'and a prisoner! Can it be?' In his perplexity he kicked at the door, and shouted, insisting, with threats, on being let out. But he might as well have called for help in the cave of St Anthony. No one answered him. At length, tired of this exercise, he surveyed the viands so temptingly arrayed on the table and shelves of the buttery, and felt there would be no difficulty in passing away the time. He immediately set to work. He began with a caviar (or pie made of sturgeon's roe), and having devoured about half of it, he directed his attention to an ample bowl of *coscoton*, or beef-soup, thickened with flour. Feeling this to be hardly solid enough, he passed on to a leg of mutton with onion-sauce; then filled up the crevices with a few pickings of stewed pigeons à l'eau bénite, and a larded quail; finishing the meal with a quince tart, and a cream *au miel*. When he had washed down this well-selected snack with a flask of Brétagne, and some half-dozen bumpers of Malmsey, a blast of the warder's horn announced it was midnight, and he was delighted to find that he had beguiled away five hours of his imprisonment pleasantly enough. Upon this he dozed off into a digestive sleep.

Meanwhile, Taillevent kept widely, wretchedly, painfully awake. He did not attempt to retire to his couch, for he knew he could not sleep. Though a cook who had been obliged to do a little butchering of late, in consequence of his royal master's whim of having the killing and dressing of his food performed on the same day, yet he was not devoid of sensibility. A plump partridge, or even a well-fed swine, would have been more in his way; but a monk!—he really was not equal to it. Besides, it would be flat sacrilege.

Thus perplexed and agitated, the unhappy artist read and re-read his instructions; but, after hours spent thus, he could only put the worst construction on his sovereign's letter. 'It must be so,' he muttered; 'this sleek churchman has been found out in some diabolical design against the crown of France—has in all probability made some desperate attempt on my beloved master's life. Still, my sovereign aforesaid hath put my love and devotion to a terrible test. But as it is my duty, I must obey him. This ill-favoured animal must pay the forfeit of his misdeeds. Parbleu!' These reflections were interrupted by loud snores from the buttery, and the pity of the cook was awakened anew. The whole of that night he was a prey to contending passions. According as they agitated him, he wept for or denounced the monk; so that sometimes he sighed, and sometimes he whetted his knife.

By daylight he had fully convinced himself that it was his duty to become the executioner of his guest; and with agitated steps, eyes still wet with weeping, and a cutlass exquisitely sharpened, he softly unlocked the door of the buttery. Its occupant did not notice him, for he was busily breakfasting off the remains of his last night's supper. The cook, who was really an enthusiast, paused on the threshold, feeling it impossible to interrupt a man who was doing such honour to his art. As he surveyed the extraordinary satisfaction with which Didier smacked his lips, his former indecision returned; and when, after taking a first taste of a *croquette de veau pané*, the epicure patted his stomach, and uttered an elongated and intensely approving 'Ha-a!' the naked weapon fell from Taillevent's hand. The noise of its descent on the floor attracted Didier's attention, and arrested his jaws just as they were going to close upon the tiddest of bits: open-mouthed, he stared first at the cook, and then at the cutlass; he trembled violently, and nearly choked himself by attempting to swallow a whole snipe at a mouthful.

'No,' thought Taillevent, 'it cannot be. There must be some mistake. A man who is blessed with so great a relish for good cheer, and who has so fine a taste for the cook's art, cannot be a traitor. The king must have been deceived; besides, if he suspect him, why did he not have him regularly tried by his court of parliament? Let me again recollect what is due to my office as

master-cook. Shall I disgrace it by assassinating one of the best eaters in Christendom? Never!

After Didier had managed to swallow the snipe, he watched his companion's countenance, and eyed the naked cutlass with great anxiety. The cook determined to end the perplexity by showing the monk the king's letter. He was horror-stricken! He had heard much of the duplicity of princes, but in this case it had reached its acme. He was, moreover, horribly afraid: his nerves were so shaken by the disclosure, that he trembled like a jelly. In a paroxysm of dread he fell down before the cook on his knees, and intreated him to be so obliging as not to kill him just then.

'By the chitterlings of Troyes!' exclaimed Taillevent, mistaking the good father to rise, 'I will neither kill thee nor prepare thee for the spit, albeit I am commanded by my august master to do so, on pain of death. But shall the sovereign of France turn cannibal, and eat monk's flesh? Not, by St Dunstan, while I rule the roost at Beauté-sur-Marne.' These words were scarcely out of the cook's mouth, before the monk attempted to embrace him, and was only prevented by his own and his companion's compulgency.

'But,' asked Taillevent, 'how am I to save my own neck for this disobedience of the king's orders?' This was a poser, and the monk, to clear his ideas, took a long draught of the Madeira. After a moment's musing, he joyfully patted Taillevent on the back, declaring he had 'hit it'; and forthwith began to propose a scheme by which Charles VII.'s orders might be partly executed without the unpleasant alternative of bloodshed.

By five o'clock that evening the monk and the cook had entered into a compact of the warmest friendship. Indeed, it may be remarked in passing, that there has existed from the earliest ages a very close alliance between these two fraternities. The execution of Didier's scheme was completed just as the blast of distant horns announced the approach of his majesty.

When the king arrived, he appeared sad and dejected—no wonder, for he had been afraid to eat since the preceding mid-day. He ordered his dinner to be instantly served, and while he was going into the *finnel*, or eating-room, he encountered the bishop, his confessor. He drew his ear closely to him, and asked, 'Well, what of the holy person I sent thee?'

'He is, in truth, a noble bird, my lord,' answered the priest; 'but if I may be so bold as to ask, *hath* he really given any special proofs of sanctity?'

'Assuredly. Hast thou never heard of the ten thousand cripples who followed him into Péronne? Return, holy father, and bring him to me, that the sanctity of St Bernadin's relics may be near me during my repast.' The wondering bishop retired to do the king's bidding.

On entering the dining-hall, Charles started with a sort of affright at beholding an enormous pie, which formed the centre-piece of the repast. Turning to the trembling Taillevent, he exclaimed, 'How now, sir cook; have I, think you, a hundred English troopers in my train to attack this enormous pie? Say, sirrah, has the bittorn which I sent thee from Fontainebleau been duly dressed?'

'Alack, dread seigneur, I did the best I could with the game you wot of; I never dressed the like dish before.'

While the king was breaking the seal of some bread (for every article brought to table was sealed by Taillevent, for fear of poison being introduced into it), a terrible screaming was heard, and presently the holy Father D'Ansey appeared with the bittorn—which had somehow escaped from the cage—hanging on his arm by its bill, which it had dug deeply into the unfortunate almoner's flesh. 'See, see, my lord,' he exclaimed in his agony, 'how the sacred brute bites!'

'What means this?' asked the sovereign, suspecting treason, and turning to the cook. 'An the bittorn be still alive, what is in the pie?'

Presently the crust of the huge pasty rose, and a man's head made its appearance, then his shoulders, lastly his whole body. It was brother Didier, who, seeing the fright he had caused the king, fell on his knees in the middle of the pie, like a saint in a niche, and presented the majesty of France with two reeking dishes. This unexpected occurrence drew forth peals of laughter from those who saw the unexpected turn the adventure had taken. The king himself condescended to conceal the intense fright he was in, by joining in the hilarity of his court. Taillevent fell on his knees, and, presenting the letter Didier had brought him, implored forgiveness for the freak; the whole blame and concoction of which he threw upon the friar. Charles extended the royal pardon; but, on learning that the good old Ducatel had been the cause of the blunder, presented him on the spot with a handsome superannuation pension.

Would we could end our story with this ludicrous adventure; but history has willed it otherwise. Not even the relic of St Bernadin, which Charles obtained from the monk, not the fidelity of the brothers Taillevent, nor common sense, could banish the dread which Charles VII. had imbibed of poison, and he died a very short time after (namely, on the 22d July 1461) at Meun-sur-Yèvre, in the province of Berri, from debility and exhaustion, brought on by overmuch abstinence. When this event happened, he was fifty-nine years old.

As to Father Didier, he went about collecting alms for years afterwards, though, whether he ever applied the proceeds to a monastic foundation, history does not state. Taillevent lived, as we have before noted, to become an author, and one of the celebrities of the fifteenth century.

HEALTH OF TOWNS.

AIR, VENTILATION, WATER, DRAINAGE.

IN a former article on the report of the Health of Towns Commission, we proposed to notice some of the measures which might, and doubtless will be adopted as remedies for the existing evils. We hear that the commission is likely to publish another volume, in which these remedies will be distinctly explained; meanwhile, the matter before us affords ample material for a brief discussion of the evidence, which in no instance is more precise or positive than on the points involving due supplies of water and air. We are accustomed, superficially speaking, to consider our national progress as something far beyond all that has preceded it of a similar nature. But when we come to look beneath the surface—to turn aside from the polished street or the broad highway—and inquire into the condition of the swarming millions who toil, and know no respite from their earliest breath to their latest sigh—we are rebuked and abashed. We there find the existence of evils which have long been regarded as inseparable from civil progress: they are, like the air we breathe, everywhere; and as common objects excite but little attention, they have not been thought worthy—if thought of at all—the trouble of investigation. The slight remove from a state of barbarism, as regards the nation at large, cannot be better illustrated than in the imperfect arrangements existing for the distribution of water, for ventilation, and drainage. Water is regarded, and justly, as one of nature's cheap and simple, yet highly efficacious agents in the maintenance of health: most persons regard water as a very useful liquid: we require it for cleanliness, economy, and morality. A dirty population—they who cannot, if they would, remove the impurities from their persons or their garments—will always be found depraved and immoral. The report gives us several instances of families leaving the open

country, the green fields, and leafy lanes, driven by want of work and food to settle down in some dark and polluted alley in London. At first they clean and sweep their houses and doorways with laudable perseverance; but the ceaseless accumulation of filth, the unwholesome influences around them, soon break down their energies; their rosy cheeks become pale; and at last they sink into the common mass of the haggard and the wretched. Their pure and healthful excitement being gone, they seek to renew it by gin-drinking, to which their poverty is often attributed, when, in many cases, it is the result, and not the cause. 'A people may exhibit qualifications for which mere outward cleanliness of habit would be a poor exchange; but in that minor virtue there is always one great advantage, that its existence checks the career of degradation at a certain point. Religion, morality, education, have their higher spheres of protection; but when none of these is at hand, in this despoiled virtue there is a check before the utmost stage is reached.'* Mr Cubitt, in his evidence, says that 'the more cleanly the people become, the more anxious are they to get rid of offensive accumulations; and it appears to me that people become, by living in a very dirty place, very much degraded; and, on the other hand, they improve if the place is kept clean about them.'

All the evidence bearing on the supply of water to towns goes to prove the extreme cheapness with which it may be afforded. Mr Robert Thom states, that, in small towns, a family of five individuals may be supplied for about 1s. 4d. per annum. In Greenock and Paisley, where the pipes are kept constantly full, the charges are 2s. 6d. and 2s. 9d. respectively, for the same period. And here a fact is elicited, to which attention should be drawn, and that is, the economy and advantage of keeping the pipes, including the branches to every house, constantly full at the proper pressure. The effect of the economy does not benefit the landlord and tenant alone, but the water company also. Where alternate supplies are delivered, and the system of fixing tanks, ball-cocks, &c. in the houses is carried out, an expenditure of capital on the part of the landlord and tenant is involved, altogether unnecessary, and equal in some cases to that of the company. In addition to this, there is the saving of room occupied by the tank. 'In many houses, where there is no convenience for a tank in the upper part of the house, it is placed in a lower apartment, and the water must be borne up stairs for use; the labour incurred necessarily restricts the free employment of the water for many purposes to which it might be beneficially and healthfully employed. Another, and a very serious inconvenience, affecting the habits and sanitary condition of the population, attendant on the system of partial or occasional supply is, that it creates an inconvenience and an obstacle to the use of baths. With a constant supply of water at sufficient pressure, baths might be supplied in private houses with little difficulty or expense, so little, indeed, that I believe it to be practicable, and hope yet to see baths introduced into the houses of labouring men for the use of themselves and families.† In poor districts, among a working population, but little time is devoted to the cleansing of their butts or cisterns; they are often altogether neglected; and being uncovered, are exposed to many sources of impurity, which render the water unfit for use: the loss of time in cleansing, and the deterioration of the water, would be immediately and effectually prevented by the arrangement of keeping the pipes constantly full. 'One experienced man, and one boy of about eighteen years of age, are, on the system of constant supply, quite sufficient to manage the distribution of the supply to about 8000 tenements, and keep all the works of distribution in perfect repair.‡ The charge for a small house is stated to amount to about 1d. per week: rather more than 5000 tenements are supplied

on these terms, no restrictions being made as to the quantity the occupiers shall consume. Before the water was laid on in Nottingham, the poorer classes were compelled to purchase water at the rate of 4d., and sometimes 4d. per bucketful. If they chose to fetch water for themselves, instead of buying it, the necessary labour, at the rate of three journeys a-day, would be worth 3d. per week; 'but the company carries into every house 79 gallons for a farthing; and delivers water night and day, at every instant of time that it is wanted, at a charge twenty-six times less than the old delivery by hand.' The increase of personal cleanliness in the town, when the water was first laid on, is described as 'very marked indeed; it was obvious in the streets. The medical men reported that the increase of cleanliness was very great in the houses, and that there was less disease. There was also an advantage in the removal of the assemblages round the public pumps.' The observation, that it would be difficult to persuade the poor to pay for a supply of water, is thus replied to:—'When the company introduced the uninterrupted supply at Nottingham, the poorest tenants required it of their landlords; the landlords then said, "If you will consent to pay an additional penny per week of rent, we will try to arrange it with the company." This was the case in thousands of instances. The charge was in these cases made upon the landlord, and he put it upon his rent, and the tenant most cheerfully paid it.'

Mr Little states, that where the water is not led into the house, it is vain to expect that any extra trouble will be taken, on the part of the inmates, to fetch a proper supply. 'It is only done for the most urgent purposes; cleanliness is entirely neglected, and their persons and clothes remain in a most dirty state. The smell of their linen, when they give me a towel, which they tell me is quite clean, is most offensive. Their clothes are pressed through dirty water, to avoid the trouble of going out to fetch water. If proper measures were carried out for the removal of cesspools, and abundant supplies of pure water carried into the houses to every floor, and, if required, to every room, I see no reason to doubt that the health of the labouring classes might be made quite as good as that of the better classes, and that it is practicable to do so. Drainage, supplies of water, and ventilation, would extensively diminish existing mortality.' In this gentleman's evidence, we have a further illustration of the advantages of cleanliness; he quotes an instance of a filthy court, never free from disease, that was paved and supplied with the means of being kept constantly clean; there were 41 cases of sickness in the court in the seven months previous to the improvement, while in five subsequent months the cases of sickness were but two. The rent is at the same time better paid; and the landlord finds that he has benefited himself by the outlay, in addition to the improvement in the health of his tenants.

It appears that the low charge for water, already mentioned, might be very materially reduced by the substitution of pipes made of fire-clay for those of iron in ordinary use; these, which have been proved to resist a pressure equal to a perpendicular column of water of 900 feet, may be laid down at one-half of the usual expense; while they possess the advantage of being fit for immediate use, which is not the case with iron, owing to the rust and tarred yarn used in making the joints.

We come now to the suggestions for the adoption of water-closets in all classes of houses, in place of the ordinary receptacles, which are particularly prejudicial to health, as they sap and destroy the foundations of houses, permeate the earth in every direction, rendering the water of wells offensive and injurious, besides poisoning the atmosphere with noxious exhalations. The expense of a glazed earthen soil-pan connected with the house-drain and the sewer, fitted with a tap and the necessary apparatus in a cheap form, supposing the water to be constantly on, would not be more than 2½d. weekly; one half of the charge incurred by the use and emptying of cesspools, and utterly insignificant when compared with

* *Tait's Magazine*; December 1841.

† *T. Hawkey, Esq.*

‡ *Ibid.*

the amelioration of health that would accrue from their use. It is stated that the new apparatus has been introduced in Glasgow and other manufacturing towns, and in London into the dwellings of the working-classes, who express their satisfaction with the arrangement, and are eager to avail themselves of it.

With such facts as these before them, it can hardly be supposed that the authorities will hesitate to recommend the immediate application of the obvious remedies: the evidence is too conclusive as to the fearful sacrifice of life, mind, and body, under the existing evils, to suffer from contradiction: it is of no use attempting to deny or disguise the facts; there they are: how long they shall remain, depends on the nation at large.

The effluvia created by imperfect drainage not only operate prejudicially on the public health, but tend also to deteriorate the value of property; rows of convenient houses are built, but being situated near stagnant ditches, or open drains, no respectable tenants will remain in them. 'My tenants have repeatedly complained of the open sewer not only as a nuisance, but of serious illness occasioned by the stench arising from it. Were it not for the sewer, I could get a better class of tenants for these houses than the present occupants; as it is, I am obliged to let the houses to poor families who depend upon lodgers for the payment of their rent, and those lodgers are continually leaving from illness. Only ten days ago one of my tenants said to me, "Sir, it is impossible to let my best rooms; every person who lives in them is taken ill." This is not a solitary case; in the neighbourhood of Bethnal Green there are many open ditches which serve as sewers, the exhalations from which affect the surrounding houses with typhus fever. Whatever may be left undone, such nuisances should not be suffered to exist an hour.* Sewers and drains are, however, useless without a proper supply of water. 'The finest formed sewers, and the best arrangement of them, would be of no use without an adequate supply of water. The drains but furnish the ways or vehicles for transportation; the water is the moving power or carrier, and it is the cheapest that can be procured. In fact, the supply of water to a town, and the discharge of the refuse, are two branches of the same subject, and unless the water be abundant enough, and distributed enough to cleanse the drains, these last would be more offensive than useful.†

The importance of water as an element of health will justify the space we have given to the discussion of the arrangements into which it enters. There are, however, many other points of the evidence worthy of notice, to which we can give no more than a hasty glance: one of the most striking is, 'the desultory manner in which new streets are planned, which prevents sufficient drains being made. No houses ought to be built within or near a populous town, until a proper approach thereto has been made by a street or road, paved or macadamised. This arrangement would lessen the cost of building by the facility of conveying materials, and tenants would prefer houses with good approach and sufficient drainage.'‡ 'Experience has amply proved that the necessary precaution for health, comfort, and cleanliness, has been, and will be, neglected by the public. Ignorance of the requisite preventives, and the interference of conflicting local interests, which, after the London fire, prevented the adoption of Sir Christopher Wren's admirable scheme, have always since that time, and will further continue to prevail in baffling the efforts made towards improvement by the enlightened minority. There seems every reason to believe that, unless public provision be made to obtain efficient drainage, the same effects will continue to depress the health and deteriorate the property of all classes, pressing particularly heavy on the poorer classes, who cannot protect themselves. In the canvassing of the respective merits of various plans, ventilation of the

streets and buildings, and the reservation of public walks and open spaces, should hold a most important place. It is really surprising to witness with what complete disregard of these considerations new districts, built for working men and manufacturing classes, are designed. While the public concur to a man in lamenting the past neglect on this point, it seems that for all, except the habitations of the wealthy, its importance is yet completely disregarded in practice. To secure ventilation, the streets should be straight, and should radiate from a centre; they will then open directly on the surrounding country; thereby the air will be most readily and continuously changed, and the pure atmosphere of the fields will rush directly through the town, attenuating the noxious gases, and revivifying the used air.*

We shall conclude this article with a few observations on ventilation, an operation which yields to none in importance or beneficial results. A very simple and economical ventilation is described by Mr Toynbee, which 'consists of a plate of zinc, very finely perforated with two hundred and twenty holes to an inch. Their size varies from four to twelve inches square, according to the size and construction of the room. They are generally introduced in the uppermost portion of the window, and in the corner pane the farthest from the fireplace. These fine orifices prevent the air coming in with a rush, which would occasion discomfort, and tend to diffuse the air equally and gently throughout the apartment. The expense of these ventilators, with the fixing, is about 2s. The general observation of those who have tried them is, that the room is much more comfortable and airy; they have frequently said that they have been in much better spirits since they have had these ventilators, and have always been most grateful for them. In one house I have put ten ventilators on the stairs and landing, and the whole of the people there express a very high sense of the comfort they have experienced. In one of the rooms the smell was so bad that I could not enter into or remain in it, unless the windows were opened. I can now go there without annoyance.

Two thousand years ago, Hippocrates wrote on the importance of pure air; and all the observations made since that time, have confirmed the views of the early philosopher. We cannot see the air we breathe, and are not, in consequence, sufficiently alive to the condition in which we breathe it. Dr Harwood observes, that 'the want of wholesome air does not manifest itself on the system so unequivocally or imperatively; no urgent sensation being produced like that of hunger; and hence the greater danger of mistaking its indications. The effects of its absence are only slowly and insidiously produced, and thus too frequently are overlooked, until the constitution is generally impaired, and the body equally enfeebled.' Dr James Johnson, speaking of the effects of impure air, says, 'that ague and fever, two of the most prominent features of the malarious influence, are as a drop of water in the ocean, when compared with the other less obtrusive but more dangerous maladies that silently disorganise the vital structure of the human fabric, under the influence of this deleterious and insidious poison.'

There is one fact relating to ventilation which distinguishes it from the question of supply of water, drainage, &c.; it may be, without delay, made serviceable to all: let those who are suffering from stagnant air and confined rooms simply open the door and window occasionally to allow a current of air to pass through, and they will find the good effects in the improvement of their health and spirits. 'The renewal of the air is not so light a matter as is supposed. To effect it, a simple communication is not sufficient—a mere contact of the external and internal air. It is necessary that one or more currents exist to multiply that contact, and cause the pure air to pervade that which is vitiated.'

Legislative enactments are sometimes good; but self-

* Butler Williams, Esq.

dependence and exertion are still better. Let every one exert himself to remove the evils within his own sphere, and the task of the government will be comparatively easy.

SHORT NOTES ON THE WEST INDIES.

BY A LATE RESIDENT.

FOURTH ARTICLE.

Houses of Assembly.—Until that apple of discord, the emancipation question, was thrown into the Houses of Assembly, the work of legislation, I have been informed, assumed the simplest form possible. Some leading man, conceiving a particular evil required a particular remedy, would proceed to the house with a bill in his pocket, and there propound it. It would be passed, probably without amendment—at any rate without anything approaching to discussion or debate. It was left for modern times to elicit the spark of oratory which lay smothered within the bosoms of our colonial orators. There is now as much talking in the Houses of Assembly as there is any occasion for, and sometimes more than is consistent with a proper discharge of the public business. On all occasions, however, strict adherence to parliamentary usage is maintained, and 'Hatsell' quoted as a work of standing authority.

I have been present at the bar of a House of Assembly for many consecutive nights, and for many succeeding sessions, but I do not recollect an occasion, where a question arose peculiarly affecting the people and a strong contest of party ensued, that the liberal (that is, the anti-slavery) portion of the house came off victorious. Some doubt may naturally exist whether there is, in the West Indies, a fair, that is, an equal, representation. I have also stood at the bar of a House of Assembly, and observed the individual interests of the members swaying their deliberations, as a current of wind would the waters of a standing pool. The planter has wished for this, the grazier has sought for that, the merchant has desired the other, and then, as the force of a rising public opinion, or the expressed or obvious wish of the government has been brought to bear upon the discussion, those individual interests have been all forced to merge in some measure calculated for the general good. I will not say that this has often occurred, but this I have seen. The newly emancipated have not yet had a full opportunity of showing what description of representatives they would return; but they anticipate it will soon occur, as the termination of the first septennial parliament of the present reign is near.

The squabbles which were once so common between the Houses of Assembly and the representatives of majesty have gradually diminished within the last few years; occasionally, we have some account of a rupture, and of members being sent to their constituents. When this happens, however, the style in which each party addresses the other is no longer indecent, insulting, or outrageous.

Home.—The word 'home' is as expressive in the colonies as it is in England; but unfortunately for the former, all its force is centered in the mother country. 'Home,' in fact, is the word used expressly to designate Great Britain. The merchant will say that he receives his consignments from 'home'; the planter that he ships his produce 'home'; the young Creole that he expects to take a trip 'home'; and thus it goes on to the last person who may have occasion to refer to the mother country—often to those who never expect to see it—very frequently to those who have no friends or connexions residing there. This I take to arise, with reference to one class of persons, from the fact, that they contemplate going or returning to the mother country so soon as they have attained a competency, and, with reference to another, that there is little in the colonies to excite in their minds the idea of the endearing ties attached to the word 'home'—many of them having

either heard of or experienced the immense moral, civil, and social advantages possessed by Great Britain. Their affections become thus engaged, and they give the most endearing name to that place to which those affections cling. Others, again, use the expression from custom, from fashion, or otherwise; but from whatever cause, among all classes it is common. This may enable us to form some idea of the nature of the estimation in which the mother country is held, and of the interest which is taken in all proceedings there, whether political or otherwise. With reference to politics, the colonies are generally as much affected by the success or defeat of a ministry, as if their own existence depended upon either. This may appear natural enough, but it is really not so; for, whatever the ministry, the government of the colonies usually remains the same, probably for this reason, that they have no voice at home, or but a very feeble one. Once only, as far as I am aware, was this estimation in which the mother country is held somewhat shaken, and that was when the discussion of the slave question reached its climax. It was then gravely canvassed in certain circles whether the colonies should not be put under the protection of America. Such a measure would have been opposed to the death by the coloured and black classes, who hate the Americans; but it shows that the good feeling which had prevailed with reference to the mother country was somewhat lessened; whether justly so or not, we will not stay to inquire.

Many good results no doubt arise from this engrossing affection towards the mother country; but one evil effect induced is, that no general attempt is made by the inhabitants of the colonies to improve their institutions, or to increase their moral, social, or intellectual resources. Few good works originate with them, or, if originated, are brought to completion, because parties do not contemplate the enjoyment of any improvement that might be made. Hence again the absence of all public spirit. It is not thus in the French West India colonies, which are universally admitted as taking a higher stand than the British in moral, social, and intellectual advancement. When the Frenchman leaves his native country for the colonies, he makes the latter his 'home'; and casting few lingering regrets to the old world, he endeavours to render the new as comfortable as his means will allow. As the attempt is half the victory, he seldom fails. I fear little improvement in the respect here commented on will take place with us, until the 'old things shall have become new,' and the now rising generation shall have made some further progress in the attainment of knowledge, of conscious importance, and wealth. Not that I would have them hereafter to regard the mother country with less affection, but the colonies, the place of their birth, with the greater.

Negro Preaching.—There are negro 'preachers' or parsons in the West Indies of the dissenting persuasion, who attract large congregations of their own class; but I am not in a situation to form an opinion on the extent of their theological learning, or the general nature of their discourses. Passing one of their conventicles on one occasion, I stayed for about two minutes to listen to the preacher who was then delivering his sermon. He was in the act of comparing the Bible to a mirror, in which every individual may view himself reflected, and I thought he discharged himself creditably of his task. One original character I have heard of, who seems to give some verity to the caricatures we sometimes see in the print-shops of London on the subject of negro sermons. He had been, and probably continued to be, a fisherman, and would illustrate his discourses by circumstances or ideas connected with his calling. Dilating on the nature and extent of Job's patience, he would say, 'My bredren, you been yerry 'bout Job. Berry well. You want pe yerry what da Job-pashance? Me will tell you. Fisherman go out all night—him fish—fish—fish—tā daybroke, and no mo ketch so, so tree prat. Him come home—him put him tree prat 'pon

top-a-house fe dry. Jan-Cro' come, tèk one—berry well—Jan-Cro' come, tèk nada—him come tird time, take tarra. De prat all gone—but fisherman no say "—Jan-Cro'!" Dat da Job-pashance!"

Climate.—Most Europeans entertain dreadful ideas relative to the climate of the West Indies; but I am inclined to think that the climate has not only to bear the burden of its own sins, but also that of the sins of those who resort to it. Great mortality is found to exist in the army and navy stationed in the West Indies: the climate is at once adduced as the cause. Young men sent out as planters, or merchants' clerks, die in a short time: the climate is blamed. Parties do not reflect, or probably do not know, that soldiers and sailors are the most debauched classes in the West Indies; while parents do not bear in mind that the wildest and most hair-brained of their children was selected as he who should be shipped off; or who probably went of his own accord. I don't mean to infer that, to a European, the climate is as salubrious as that of his native country. Extreme changes are always dangerous, whether to the native of a temperate, or to the native of a torrid zone. But I would be understood to say, that a vast majority of the deaths which are attributed to climate should be set down to unsteadiness and intemperance. However strange it may appear, many Europeans, respectably and delicately nurtured, no sooner reach the colonies than they throw off all restraint, and pursue such courses of life as would at home procure them the character of reprobates. These die off, of course; but it is unreasonable to charge the climate with their death. Perhaps one of the most forcible arguments which may be used in favour of the view, that the climate is not as unhealthy as supposed, is the fact—I believe it is a fact—that European females do not fall sick and die in the same proportion with the males. They are not exposed, say some. Not so: they are temperate, and this secures them from the pernicious effects of the climate, as it secures males who are temperate also. A goodly number of European missionaries visit the West India colonies; but I have never heard it remarked that deaths among them are numerous. They are as much exposed to the effects of the climate as any body of men whose occupation is not that of manual labour in the fields, yet do they not die away as men in the army and navy. The secret undoubtedly is—they are temperate. Labour in the fields, under a burning sun, would certainly tell fearfully on the constitution of Europeans: again, however, there are certain localities which are not unfavourable to European labour,* the only difficulty being to confine Europeans to the spot. It was found impossible so to confine them; hence, with dissolute habits, the dreadful mortality which ensued. In the absence of anything which I can regard as correct data of the general unhealthiness of the climate—the circumstance that less care is necessary, and less actually taken, in the West Indies with relation to diet and clothing—that less fears are entertained relative to the approach of illness, so that, probably, not one tenth part of the medicines are taken which are taken in England—may lead to the presumption, that the natural causes of disease at any rate are not so formidable as many suppose. The yellow fever seems to be the 'death's-head and bloody bones' of the colonies; for my own part, I think 'consumption' as fruitful a cause of death in England as the yellow fever has ever proved in the colonies: consumption, too, affects Europeans, while the yellow fever seldom visits the natives of the tropics.

Homage.—One of the natural results of slavery in the

West Indies is a morbid love of homage and personal deference, which not only pervades the upper classes, but, by a process of imitation, even those who were the subjects of slavery. Respectable children are usually taught, or suffered by their parents, when called, to reply 'ma'am' and 'sir,' instead of the endearing appellations of 'mother' and 'father'; and wo would it have been to the poor slave who heedlessly forgot those first titles of respect. On the other hand, a young negro must not address an old one without adding the title of 'uncle' or 'anty,' 'goddie' or 'grandee,' 'daddy' or 'mammy,' unless he wishes to offend in the grossest manner possible. It is no doubt this feeling which leads many of them to be excessively annoyed when addressed with an opprobrious or slighting epithet. Hence the police-offices are generally deluged with complaints of abuse or assaults, originating in such trifling expressions as, 'Look how him tan,' 'Him face tan like a baboon,' &c. This thin-skinnedness, however, is not confined to the lower classes. I once saw an apparently respectable lady at a peace office complaining of a negro, who had said that she was a 'John-Crow flying from the four quarters of the world, to come to pitch and grow fat upon the property.'

Prejudices.—The prejudices of caste, which once took such firm hold of parties in the West Indies, are, as I have already said, fast disappearing. They are too intimately connected with the history of the colonies, however, to be passed by without some further remark. The object of those prejudices was of course to uphold the authority of the dominant class; and as the colour of that class was white, white became the standard of perfection, and the sole claim to consideration and advancement. The free man who was not white was not permitted to have an interest in the free institutions of his country, and he could neither elect nor be elected, however great his wealth or talent. Like others, he paid his contributions to the exigencies of the public, but he received no benefit from the funds collected; he was a subject, and was yet denied the benefit of the laws; he was punished when he offended against them, yet could not obtain redress when offended; he was insulted, yet he could not retaliate; beaten, but he could not strike. His family was often outraged, yet he had no relief; his limbs maimed, yet the courts of justice would not receive his evidence of the injury. He was an heir, yet he could not always inherit; a husband, and could not protect. By and by, however, individuals saw the iniquity of the system; a sense of intense injustice disseminated itself; the oppressed became strong; they petitioned for equal rights; many swore to obtain them or die in the attempt; and at length we saw granted to expediency that which was denied to justice. Such, I believe, has been the history of despotism in every quarter of the globe—rampant when it may safely be so, but crumbling powerless to the earth when its victims feel their strength and use it.

Christian Names.—Many of the Christian names among the lower classes are scriptural, others classical; others, again, simply pretty, according to the whim of the masters or mistresses, relatives or friends, who gave them. The most common are Daniel, David, Patience, Prudence, Charity, Hope, Faith, Phoebe, Hebe, Homer, Cato, Caesar, Diana, Duke, and Prince. The surnames used generally to be those of the masters and mistresses.

THE OLIVE TREE.

About twenty different kinds of olives are known in this country at the present day, some of which are esteemed for their fragrance, as *Olea fragrans*, and others for their fruit, as *O. Europæa* and its varieties. This last species has been known and cultivated for many ages, and from very ancient custom, the olive branch has been used as an emblem of peace. It is a native of the south of Europe and the north of Africa, where it is very generally and extensively cultivated. It is supposed to have been carried from Egypt into Attica about 1556 before the Christian era. It

* In the blue book for the West Indies, 1841, vol. ii. p. 5, is an account of the settlement of 'Freeman's Hall,' in the interior of Trelawney, Jamaica, by fifty English and German emigrants. At that date it had been successful, not a death having occurred. In the blue book for 1844, on emigration to the West Indies, p. 11, will be found another account. These go to show that, under certain circumstances, European emigration will succeed: the great majority of cases is, however, the other way.

was first planted in Italy in the thirteenth year of the reign of Servius Tullius, the sixth king of Rome. The Romans appear to have paid great attention to its culture, and considered it next in value to the vine. According to the best authenticated accounts, the olive was introduced into England in 1570; and although it has been so long an inhabitant of this country, it is cultivated in but few places, and in these few it is generally known in the greenhouse as an ornamental plant. In its native country, the olive is extensively cultivated for the sake of the oil extracted from the berries; but the variableness of our climate renders the probability of crops of the fruit very precarious out of doors, and they are not of sufficient value to grow extensively under glass. The oil of olives is contained in the pulp only, and not in the nut or kernel, as in most other fruits. It is obtained by simple pressure: the olives are first bruised by a millstone, and then put into bags, after which the liquor is pressed out by means of a press. The bags are either made of linen, hemp, or rushes, and occasionally woollen ones are used; but as these are apt to become dirty and rancid, they are not in much repute. Those of linen or rushes are reckoned the best. Olive oil is the main support of commerce in some provinces in Italy. The quantity imported into Britain in the course of a year is upwards of 2,000,000 gallons, the duty on which amounts to about £75,000. The most valuable is imported from the south of France. Besides the extraction of oil, olives are used for pickling and preserving; and Gerard, in his 'Historie of Plants,' enumerates many medicinal properties which they possess. It is stated that two glass jars of olives, and olive oil, have been dug out of the ruins of Pompeii, both of which were fit for use.—*Magazine of Botany.*

MUTUAL BENEFICENCE.

Nothing is more unpleasant than to find that offence has been received when none was intended, and that pain has been given to those who were not guilty of any provocation. As the great end of society is mutual beneficence, a good man is always uneasy when he finds himself acting in opposition to the purposes of life; because, though his conscience may easily acquit him of *malice prepense*, of settled hatred, or contrivances of mischief, yet he seldom can be certain that he has not failed by negligence or indolence, that he has not been hindered from consulting the common interest by too much regard to his own ease, or too much indifference to the happiness of others.—*Rambler.*

'BUT.'

'But' is to me a more detestable combination of letters than 'no' itself. No is a surly honest fellow, speaks his mind at once. *But* is a sneaking, evasive, half-bred, exception sort of a conjunction, which comes to pull away the cup when it is at your lips—

It does allay
The good preceded; lie upon 'but yet.
But yet is a jaller to bring forth
Some monstrous malefactor.—*Sir Walter Scott.*

PEACE WITH THE WORLD.

The arms by which the ill dispositions of the world are to be combated, and the qualities by which it is to be reconciled to us, and we reconciled to it, are moderation, gentleness, a little indulgence to others, and a great deal of distrust of ourselves, which are not qualities of a mean spirit, as some may possibly think them, but virtues of a great and noble kind, and such as dignify our nature as much as they contribute to our repose and fortune; for nothing can be so unworthy of a well-composed soul as to pass away life in bickerings and litigations, in snarling and scuffling with every one around us. We must be at peace with our species, if not for their sakes, yet very much for our own.—*Burke.*

AIMING AT PERFECTION.

There is no manner of inconvenience in having a pattern propounded to us of so great perfection as is above our reach to attain to; and there may be great advantages in it. The way to excel in any kind, is to propose the brightest and most perfect examples to our imitation. No man can write after too perfect and good a copy; and though he can never reach the perfection of it, yet he is likely to learn more than by one less perfect. He that aims at the heavens, which yet he is sure to come short of, is like to shoot higher than he that aims at a mark within his reach.—*Tillotson.*

TO MY WIFE.

BY JOHN BOLTON ROGBERSON.

Thy cheek is pale with many cares,
Thy brow is overcast,
And thy fair face a shadow wears,
That tells of sorrows past.
But music hath thy tongue for me;
How dark so'er my lot may be,
I turn for comfort, love, to thee,
My beautiful, my wife!

Thy gentle eyes are not so bright
As when I wooed thee first;
Yet still they have the same sweet light,
Which long my heart hath nursed:
They have the same enchanting beam,
Which charmed me in love's early dream,
And still with joy on me they stream,
My beautiful, my wife!

When all without looks dark and cold,
And voices change their tone,
Nor greet me as they did of old,
I feel I am not lone;
For thou, my love, art aye the same,
And looks and deeds thy faith proclaim:
Though all should scorn, thou wouldst not blame,
My beautiful, my wife!

A shadow comes across my heart,
And overclouds my fate,
Whene'er I think thou mayst depart,
And leave me desolate;
For, as the wretch who treads alone
Some gloomy path in wilds unknown,
Such would I be if thou wert gone,
My beautiful, my wife!

If thou wert dead, the flowers might spring,
But I should heed them not;
The merry birds might soar and sing—
They could not cheer my lot.
Before me dark despair would rise,
And spread a pall o'er earth and skies,
If shone no more thy loving eyes,
My beautiful, my wife!

And those dear eyes have shone through tears,
But never looked unkind;
For shattered hopes and troubled years,
Still closer seem to bind
Thy pure and trusting heart to mine.
Not for thyself didst thou repine,
But all thy husband's grief was thine,
My beautiful, my wife!

When, at the eventide, I see
My children throng around,
And know the love of them and thee,
My spirit still is bound
To earth, despite of every care:
I feel my soul can do and dare,
So long as thou my lot dost share,
My beautiful, my wife!

[The above piece is copied directly from an American newspaper; but its author is a poet of English growth—residing, we believe, in Manchester—who has published several volumes of his effusions, from one of which probably the above is extracted.]

DISAPPOINTMENT.

Men are very seldom disappointed, except when their desires are immoderate, or when they suffer their passions to overpower their reason, and dwell upon delightful scenes of future honours, power, or riches, till they mistake probabilities for certainties, or wild wishes for rational expectations. If such men, when they awake from these voluntary dreams, find the pleasing phantom vanish away, what can they blame but their own folly?—*Dr Johnson.*

A HINT TO LECTURERS.

I have seen many Chartist and Anti-Bread Tax lectures advertised in the manufacturing districts, but I never heard of any lectures given with a view to convey correct information to the people on the influences that regulate the natural price of labour, and yet of all information there is none which it is of more importance for the poor workmen to receive.—*Kohl's England.*

PRICE 1½d.

MORNINGS WITH THOMAS CAMPBELL.

It was on a fine morning in May 1840, that I first called on Mr Campbell. He then lived in chambers, No. 61, Lincoln's Inn Fields, up two pairs of stairs. He had offered to act as cicerone, and show me the lions of London; and it was with no small pride and pleasure that I repaired to the spot, where he was so often to be seen pacing up and down in solitary meditation. He was always a great walker, and this habit continued with him to the last. I found on the outer door of his rooms, below the brass knocker, a slip of paper on which was written, in his neat classical-like hand, this curious announcement—'Mr Campbell is particularly engaged, and cannot be seen till past two o'clock.' As he had expressly mentioned that I should call between nine and ten o'clock, I concluded that this prohibition could not be meant to be universal, and resolved to hazard an application. He received me with great kindness, and explained that the announcement on his door was intended to scare away a *bore*, who had been annoying him with some manuscripts, and would neither take a refusal nor brook delay. The poet was breakfasting in his sitting-room, which was filled with books, and had rather a showy appearance. The carpet and tables were littered with stray volumes, letters, and papers; whence I inferred that his housemaid was forbidden to interfere with the arrangements of his sanctum. At this time he was, like Charles Lamb, a worshipper of the 'great plant,' and tobacco pipes were mingled with the miscellaneous literary wares. A large print of the queen hung near the fireplace, the gilded frame of which was covered with lawn paper. He drew my attention to the picture, and said it had been presented to him by her majesty. He valued it highly: 'money could not buy it from me,' he remarked. In another part of the room was a painting of a little country girl, with a coarse shawl of network pulled over her head and shoulders. The girl was represented as looking out below the shawl with a peculiarly arch and merry expression, something like Sir Joshua Reynolds's Puck. He seemed to dote upon this picture, praised the arch looks of the 'sly little minx,' and showed me some lines which he had written upon her. These he afterwards published; but as they are comparatively little known, and are not unworthy of his genius, I subjoin them:—

*ON GETTING HOME THE PORTRAIT OF A FEMALE CHILD, SIX YEARS OLD, PAINTED BY EUGENIO LATILLA.

Type of the cherubim above,
Come, live with me, and be my love!
Smile from my wall, dear roguish sprite,
By sunshine and by candle-light;
For both look sweetly on thy traits;
Or, were the Lady Moon to gase,
She'd welcome thee with lustre bland,
Like some young fay from fairy-land.

Cast in simplicity's own mould,
How canst thou be so manifold
In sportively-distracting charms?
Thy lips—thy eyes—thy little arms
That wrap thy shoulders and thy head,
In homeliest shawl of netted thread,
Brown woollen network; yet it seeks
Accordance with thy lovely cheeks,
And more becomes thy beauty's bloom
Than any shawl from Cashmere's loom.
Thou hast not to adorn thee, girl,
Flower, link of gold, or gem, or pearl—
I would not let a ruby speck
The peeping whiteness of thy neck:
Thou need'st no casquet, witching elf,
No gaud—thy toilet is thyself;
Not even a rosebud from the bower,
Thyself a magnet, gem, and flower.
My arch and playful little creature,
Thou hast a mind in every feature;
Thy brow with its disparped locks,
Speaks language that translation mocks;
Thy lucid eyes so beam with soul,
They on the canvass seem to roll—
Instructing both my head and heart
To idolise the painter's art.
He marshals minds to Beauty's feast—
He is Humanity's high priest,
Who proves by heavenly forms on earth,
How much this world of ours is worth.
Inspire me, child, with visions fair!
For children, in creation, are
The only things that could be given
Back, and alive—unchanged—to Heaven.*

The verses were written on folio paper, the lines wide apart, to leave room for correction—for Campbell, it is well known, was a laborious and fastidious corrector. The passion for children which he here evinces, led some time afterwards to a ludicrous circumstance. He saw a fine child, about four years old, one day walking with her nurse in the Park; and on his return home, he could not rest for thinking of his 'child sweet-heart,' as he called her, and actually sent an advertisement to the *Morning Chronicle*, making inquiries after his juvenile fascinator, giving his own address, and stating his age to be sixty-two! The incident illustrates the intensity of his affections, as well as the liveliness of his fancy—for, alas! the poet had no home-object to dwell upon, to concentrate his hopes and his admiration. Several hoaxes were played off on the susceptible poet in consequence of this singular advertisement. One letter directed him to the house of an old maid, by whom he was received very cavalierly. He told his story—but 'the wretch,' as he used to say, with a sort of peevish humour, 'had never heard either of him or his poetry!'

When I had read the lines, Mr Campbell retired for a few minutes. 'You can look over the books,' he said, 'till I return.' Who has not felt the pleasure of looking over the shelves of a library, with all their varied

and interesting associations? The library of a man of genius, too, has peculiar attraction, for it seems to admit us to his familiar thoughts, tastes, and studies. Campbell's library was not very extensive. There were some good old editions of the classics, a set of the *Biographie Universelle*, some of the French, Italian, and German authors, the Edinburgh Encyclopædia (to which he had been a large contributor), and several standard English works, none very modern. He did not care much to keep up with the literature of the day; and his chief delight was—when not occupied with any task—to lounge, in his careless indolent way, over some old favourite author that came recommended to him by early recollections. He occasionally made marginal notes on the books he read. I happened to take down the first volume of 'The Beauties of English Poesy, selected by Oliver Goldsmith, 1767. On the blank leaf of this unfortunate compilation Campbell had written the fact, that 'poor Goldy' had inserted among his 'Beauties,' designed for young readers, Prior's stories of Hans Carvel and the Ladle. 'The circumstance,' he added, 'is as good as the tale, besides having the advantage of being true.' I may here remark, that Mr Campbell could scarcely ever read Goldsmith's poetry without shedding tears.

The poet soon returned from his dressing-room. He was generally careful as to dress, and had none of Dr Johnson's indifference to fine linen. His wigs (of which he had a great number) were always nicely adjusted, and scarcely distinguishable from natural hair; while about an inch of whisker on the cheek was coloured with some dark powder, to correspond with the wig. His appearance was interesting and handsome. Though rather below the middle size, he did not seem little; and his large dark eye and countenance altogether bespoke great sensibility and acuteness. His thin quivering lip and delicate nostril were highly expressive. When he spoke, as Leigh Hunt has remarked, dimples played about his mouth, 'which nevertheless had something restrained and close in it, as if some gentle Puritan had crossed the breed, and left a stamp on his face, such as we often see in the female Scotch face rather than the male.' He had, like Milton, a 'delicate tunable voice,' its high notes being somewhat sharp and painful. When a youth, Campbell was singularly beautiful, which, added to the premature development of his taste and genius, made him an object of great interest. A few literary persons still survive (Joanna Baillie among the number) who knew him at this period, and remember him, like a vision of youth, with great enthusiasm. He was early in flower—the fruit, perhaps, scarcely corresponding (at least in quantity) with the richness of the blossom. Campbell was quite sensible of his interesting appearance, and was by no means disposed to become venerable. He cared little for the artist who copied nature exactly. Lawrence painted and Baily sculptured him *en beau*. Late in life he sat to Park, the sculptor, but he would not take off his wig; and the bust (a true and vigorous one) was no especial favourite because of its extreme fidelity. In personal neatness and fastidiousness, no less than in genius and taste, Campbell, in his best days, resembled Gray. Each was distinguished by the same careful finish in composition, the same classical predilections and lyrical fire, rarely but strikingly displayed. In ordinary life they were both somewhat finical, yet with great freedom and idiomatic plainness in their unreserved communications; Gray's being evinced in his letters, and Campbell's in conversation. Gray was more studious of his dignity; Campbell often acted rashly from the impulse of the moment, careless of consequences. When the late Mr Telford, the engineer, remonstrated with him on the inexpediency of contracting an early marriage, he said gaily, 'When shall I be better off? I have fifty pounds, and six months' work at the Encyclopædia!' To these personal *nugæ* I may add, that his Scottish accent was not strongly-

marked, and did not detract from his point and elegance either as a lecturer or converser.

We shortly sallied out. Mr Campbell was rather nervous, and hesitated at the street crossings. I said the noise of London was intolerable, but that long usage must reconcile people to it. 'Never with some,' said he; 'I have been used to it for nearly forty years, and am not yet reconciled to it.' He certainly seemed uneasy when within the full sound of the great Babel and her interminable roar. When we got to a quiet alley or court, he breathed more freely, and talked of literature. He expressed his regret at having edited Shakspeare, or rather written his life for a popular edition of the dramas, as he had done it hurriedly, though with the right feeling. 'What a glorious fellow Shakspeare must have been,' said he; 'Walter Scott was fine, but had a worldly twist. Shakspeare must have been just the man to live with.' He spoke with affection and high respect of Lord Jeffrey. 'Jeffrey,' said he, 'will be quite happy now. As a judge, he has nothing to do but seek and follow truth. As an advocate, he must often have had to support cases at which his moral nature revolted.' Talking of Jeffrey's criticism, I instanced his review of Campbell's *Specimens of the Poets*, which is copious, eloquent, and discriminating. 'You must have taken great pains with some of the lives,' I said. 'I did,' he replied, 'yet they say I am lazy. There is a washy, wordy style of criticism, and of telling facts, which looks specious, and imposes on many: I wanted, above all things, to avoid that.' 'You might perhaps have added to your *Specimens* with advantage. Part of Thomson's *Seasons*, for example, might have been given, as well as the first canto of the *Castle of Indolence*.' 'The *Castle of Indolence* is a glorious poem,' was his only answer. It must be admitted that in his selections from the poets Mr Campbell sometimes betrays the waywardness and caprice of a man of genius; but his criticism is invariably sound, and his style of narrative picturesque and graceful. 'Spenser,' he continued, 'is too prolix—his allegory too protracted. Here Thomson, from the nature of his subject, had the advantage. What a fine picture is that of Spenser reading the *Fairy Queen* to Raleigh on the green beside his Irish castle! Raleigh such a noble fellow, and Spenser so sweet a poet; and the country so savage, with its Irish kerns and wild Desmonds, with their saffron-coloured kilts and flowing hair!' And the kindling poet quoted some of Spenser's lines—

'I sat, as was my trade,
Under the foot of Mole, that mountain bear,
Keeping my sheep amongst the coolly shade
Of the green alders by the Mulla's shore.'

'The *Mole*,' said Campbell, 'is the Ballingowra hills, and the *Mulla* is the Awbeg river: they should change the names, making Spenser godfather. With equal poetical grace Spenser calls Raleigh the "Shepherd of the Ocean," and the "Summer's Nightingale," both fine characteristic appellations. I like the last particularly, for Raleigh was really a poet, and he planted all about his house at Youghal with myrtles and sweet-smelling plants. Spenser's place, Kilcolman Castle, was only a few miles from Youghal, and no doubt they saw many sunsets together.' Campbell was here on a congenial theme, and I am tempted to quote what he has said so eloquently and picturesquely on the same subject in his *Specimens*:—

'When we conceive Spenser reciting his compositions to Raleigh in a scene so beautifully appropriate, the mind casts a pleasing retrospect over that influence which the enterprise of the discoverer of Virginia, and the genius of the author of the *Fairy Queen*, have respectively produced on the fortune and language of England. The fancy might even be pardoned for a momentary superstition, that the genius of their country hovered, unseen, over their meeting, casting her first look of regard on the poet that was destined to inspire her future Milton, and the other on the maritime hero who paved the way for colonising distant regions of the

earth, where the language of England was to be spoken, and the poetry of Spenser to be admired.'

This would form a fine painting in the hands of MacIver, or some other post-spirited artist. Only a few fragments of Spenser's castle remain, matted with ivy; but, the situation is still lonely and beautiful—undefaced by any incongruous images or associations. Some of Raleigh's myrtles have also been preserved, and his house still stands. The melancholy fate of both these great men deepens the interest with which we regard their residences. The poet, as is well known, was driven from Kilkoman by a furious band of rebels, who set fire to the castle, burning an infant child in the ruins, and causing, within a few months, from melancholy and despair, the death of the gifted Spenser. Raleigh was sacrificed to the cruelty and cupidity of James I. Let us drop a tear over their sad and chequered history, and thank God that genius, taste, and enterprise, now flourish under milder suns and happier influences!

Campbell was keenly alive to such impressions, and loved to tread as it were in the footsteps of the departed great. He regretted that only one of Milton's London houses should be left—one occupied by him when Latin secretary in Westminster. This house looks into St James's Park, and is situated in York Street (No. 18), in a poor and squalid neighbourhood; but it was then 'a pretty garden-house, next door to the Lord Soudamores.' Milton occupied it eight years—from 1651 to 1659. We went also to Dryden's last residence, in Gerard Street, Soho. Here 'glorious John' wrote his magnificent Ode and his Fables, and here he died on May morning 1700. The house is a respectable old-fashioned dwelling. It was formerly occupied by a comely dame—a Wife of Bath—who dealt in contraband lace, gloves, &c. The late Lord Holland often called to see the interior; but the cautious mistress, presuming that his portly and comfortable presence was that of a custom-house officer or other government functionary, kept the door in her hand, and steadily rejected the solicitations of the peer. Windmill Street, where Sir Richard Steele ran off on seeing the bailiff, is in the close vicinity, and the incidents are, in character and keeping, not unlike each other. There was also Congreve's house at Surrey Street, in the Strand; Johnson's famous residence in Bolt Court, Fleet Street (now profaned, as he would deem it, by its conversion into a printing-office for a dissenters' newspaper), and poor Goldsmith's chambers in the Temple, No. 2, Brick Court. His rooms were on the right hand ascending the staircase (as the faithful Mr Prior relates in his *Memoir*), and consisted of three apartments. These are now occupied by a solicitor, who pens law papers in the room where Goldy wrote his plays, or watched the rooks cawing about the time-honoured court and garden.

'I have,' he says in his *Animated Nature*, 'often amused myself with observing their plan of policy from my window in the Temple, that looks upon a grove where they have made a colony in the midst of the city. At the commencement of spring, the rookery, which during the continuance of winter seemed to have been deserted, or only guarded by about five or six, like old soldiers in a garrison, now begins to be once more frequented; and in a short time all the bustle and hurry of business is fairly commenced.'

And there they still bustle and hurry in spring, while Goldsmith sleeps without a stone in the Temple burying-ground. The poet's apartments were looked upon as airy and even splendid in their day. The walls are vainscotted, but have now a dingy appearance. Their occupant was thought to have spent an unnecessarily large sum (£1400) in furnishing them, yet the sale catalogue (printed by Prior) shows only one department of prodigious expenditure—one highly characteristic of the poet's principal foible, personal vanity. He had only one bed, one sofa, and a moderate complement of necessaries, but he had 'two oval glasses, gilt frames,' 'two ditto,

two light girandoles,' 'a very large dressing-glass, mahogany frame,' and 'a three-plate bordered chimney-glass, gilt frame.' In this multiplicity of mirrors the poet could dress and admire his little undignified person, arrayed in his bloom-coloured coat and blue silk breeches. Goldsmith, though contemned and laughed at in his day, and held far inferior to his illustrious friend Johnson, now overtops the whole of that brilliant circle in real popularity and genuine fame. 'The wonder is,' as Campbell remarked, 'how one leading so strange a life from his youth upwards, could have stored his mind with so much fine knowledge, taste, and imagery. His essays are full of thought, and overflow with choice and beautiful illustration.'

'Have you been to Windsor?' asked Mr Campbell. I replied that I had, and spoke of the magnificence of the palace and the parks. 'Ay,' said he, 'the old oaks—the noble old oaks. Did you notice how they spread out their gnarled roots and branches, laying hold of the earth with their talons?' and he put out his clenched hand to help the expression of his vigorous and poetical image. All Scotchmen visiting London in spring should go, he said, a night or two to Windsor, Kew, or Richmond, to hear the nightingale. It was also heard in full voice in the grove around Sion House, the seat of the Duke of Northumberland. He thought Milton's description of the nightingale's note correct as well as rich—

The Attic bird
Trills her thick-warbled notes the summer long.

He maintained, also, with Chaucer and Charles James Fox (a singular juxtaposition), that the nightingale's note was a *merry* one, and 'though Theocritus mentions nightingales six or seven times, he never mentions their note as plaintive or melancholy.' Because it is heard in the silence of night, generally when we are alone, and amidst the gloom of thick woods, we attach melancholy associations to it. 'For pure English nature, feeling, and expression, read Dryden. He is the best informer and expositor.' We must understand this as applicable to Dryden's late productions—not his rhyming tragedies and stiff quatrains, which are anything but natural or pleasing.—*To be continued.*

NOTES OF A NATURALIST.

Plants.—In watching the development of plants, one is sometimes almost inclined to believe that their movements are the result of premeditation and thought, so nearly do they approach to the actions of animals.

A few plants of sweet pea, dug up when very young, were placed upon a table with their small springing rootlets turned half way round from a wet sponge placed within two inches of the seed lobes. In two days the rootlets had twisted completely round till their extremities touched the sponge, from which they could derive the moisture necessary for their growth. In another experiment a potato which had begun to germinate was placed in a dark box, in which was a small hole exposed to the sun. The potato was placed two feet from this hole, and at a little interval two stones were placed in a line between the potato and the hole. At the end of two weeks the white slender stem of the potato had crawled forward, but, meeting with the opposing stone, it made a bend round one side of it, and again grew out in nearly a straight direction, till, coming again in contact with the second stone, which still obstructed the light, it made a similar bend round it, but more in an upward direction, so as to reach the opening and the desired light.

On the same principle of seeking nourishment, strawberry plants set on the border of a gravel walk will send the whole of their roots into the garden soil, and not into the dry gravel. These movements may be all explained by supposing a strong attraction to subsist between the fibres of the plants and the moist soil by which they are drawn together; and, in the case of the

potato, of all plants for the light of the sun. But the well authenticated instance of the shrub planted on the top of a stone wall, as related by Sir E. Smith, is of a more complicated nature.

An ash tree was observed to grow from a scanty portion of soil lodged in a crevice on the top of a garden wall. The stem advanced to a certain height, when, apparently from want of due nourishment, it made a stop. Soon after this pause in its growth a rootlet was seen growing out from the plant, which continued rapidly to shoot downwards, till at last it reached the soil at the bottom of the wall: no sooner had this taken firm possession in the ground, than the main stem again commenced growing with renewed vigour. Now, this was apparently as near a resemblance to the deliberative acts of animal instinct as it is possible to conceive.

There is an aquatic plant, the spiral valisneria, which is common in the ditches of Italy. This plant has the male and female flowers growing on different stalks, and at the period of seeding, it is singular to mark the means by which fructification is produced. The greater part of the plant grows below the surface of the water, and the female flower is produced on the extremity of a long slender stem, twisted round and compressed like a screw or coiled-up piece of wire. When these flowers are ready to blow, the compressed and twisted stem suddenly relaxes, and is consequently lengthened, so that the blossom mounts up and floats on the surface. At the same time the male blossoms are evolved from other plants; they also mount to the surface, but immediately break off from the stem. The slightest breeze then floats them along, until they reach the female blossoms, around which they are seen to cluster in great numbers. The spiral stems afterwards shrink, and the female buds return under water, there to mature their seeds.

The ground nut of South America (*arachis hypogea*) has a very singular mode of planting its seeds. It is an annual plant, with long trailing stalks, furnished with winged leaves composed of four hairy lobes. The flowers grow singly in long stalks, and are of the pea family. They produce oval pods, containing two or three oblong seeds. As the flowers fall off, the young pods are forced into the ground by a particular motion of the stalks, and are thus buried to a considerable depth in the soil.

When great drought prevails for a considerable time, all plants hasten onwards to fructification. They immediately cease to throw out new leaves or branches; but summoning, as it were, all their remaining vigour, they push out the seed-stalk and the fructifying organs, in order to secure a succession of offspring before they die. There is a beautiful palm, the talipot, or Palmyra palm, a native of Ceylon, which does not produce flowers till its eightieth year, the last also of its existence. At this period, when it has attained its full growth, the flower-spike, which is then as white as ivory, bursts with a loud report. In the course of fifteen or twenty months it showers down its abundance of nuts. This effort to provide a numerous succession proves fatal to the parent. Thus it presents the singular phenomena of a long-lived plant only blossoming once during its existence, when it dies, and, in dying, like the fabled Phenix, sheds the seeds of a future generation around it. Mr Bennet mentions that the flower is occasionally thirty feet in length: this gentleman witnessed several of the singular explosions of these palms in the forests of Ceylon. The broad leaves of this tree are used by the natives as fans; and all their books are written upon thin laminae of the leaves. Tents are also constructed of them; and the pith of the trunk furnishes a substance like sago, which is used for food.

Animals.—Much has been written on the instincts or mental gifts of animals, but much is still required to throw light upon this curious subject. Authentic anecdotes of the habits and actions of brutes are always interesting: the more of these that can be collected, the more are we likely to know of what may be called

the *psychology* or history of the mind of the inferior animals.

It appears to me that, in the general manifestations of the animal mind, some one of the senses is employed in preference to the others; that sense, for instance, which is most acute and perfect in the animal. In the dog, for example, the sense of smell predominates, and we accordingly find that, through the medium of this sense, his mental faculties are most commonly exercised. A gentleman had a favourite spaniel, which for a long time was in the practice of accompanying him in all his walks, and became his attached companion. This gentleman had occasion to leave home, and was absent for more than a year, during which time he had never seen the dog. On his return along with a friend, while yet at a little distance from the house, they perceived the spaniel lying beside the gate. The gentleman thought that this would be a good opportunity of testing the memory of his favourite, and accordingly arranged with his companion, who was quite unknown to the spaniel, that they should both walk up to the animal, and express no signs of recognition. As they both approached nearer, the dog started up, and gazed at them attentively, but he discovered no signs of recognition even at their near approach. At last he came up to the stranger, put his nose close to his clothes, and smelt him, without any signs of emotion: he then did the same to his old master, but no sooner had he smelt him than recognition instantly took place; he leaped up to his face repeatedly, and showed symptoms of the most extravagant joy. He followed him into the house, and watched his every movement, and could by no means be diverted from his person. Now, here was an instance of deficient memory through the organs of sight, but an accurate recollection through the organs of smell.

I have been more than once surprised, during the sunny days of summer, and in the smoke and din of the city, to find my box of fragrant nignionette visited by the hive bee. I could not but admire this laborious creature as I saw it alight and diligently explore every expanded blossom, collect the treasured sweets, and then, without loss of time, wend its way again through the smoky atmosphere, bearing its treasure to its distant rural hive. What could have led it into such a Babel of stone and lime, and smoke and hubbub, but its exquisite sense of smell, which could even at a great distance discriminate the odour of a flower from the other noisome scents with which it must have been mingled? To our obtuse sensations, such a refinement of smell is almost inconceivable. Yet such powers are manifested by many other animals.

The story which Dr Franklin tells of the ants and cup of treacle is well known; but I suspect the doctor's deductions are erroneous. Finding a number of ants eating up a quantity of treacle in a cup, he took and suspended it by a thread to the roof of the room, in order to isolate it completely. One end of the thread, however, he inadvertently left communicating with the floor, and with the pin in the ceiling. A single ant, which had been left in the cup, found its way along the cord to the ceiling, and from thence, by the continuation of the string, to the ground. In a few minutes hundreds of the other ants were seen ascending by this string, and descending to the cup; from whence the doctor concludes that the single ant had made some communication of the circumstance to its companions, by some natural signs analogous to language. Now, I would rather suggest that the ant, in making its escape by the cord, had thus left all along it an odour of treacle, and that this being quickly perceived by its companions, was the immediate and sensual means of the communication; and that, guided solely by smell, they retraced the path of their companion. Mr James, in his account of Travels to the Rocky Mountains, mentions that the smell of the bison is so acute, that when their party advanced within two or three miles to windward of flocks of those animals, even though they were not yet in sight of each other, the wild cattle immediately took

the alarm, and were to be seen in great numbers taking a circuitous route to escape them—cows, bulls, and young calves running along with great swiftness.

In the horse, the sense of vision predominates. He has a large and beautiful eye, well adapted for vision during the day, but, from the form of the retina, peculiarly suited for night. A horse, if his rider give him a free rein, will pick his way in a dark night with astonishing precision, and will safely reach home through pitchy darkness, in which his rider can discover no object whatever.

The lion, the cat, and other night-preying animals, have also vision in a very perfect degree at that season, though, during the glare of sunshine, this faculty is so inapplicable as to render them stupid and timid in the extreme. Birds of prey have very acute vision, and the following anecdote illustrates this in the case of the vulture. In the year 1778, Mr Baber and several other gentlemen were on a hunting party in the island of Cassembar, in Bengal. They killed a wild hog of uncommon size, and left it on the ground near the tent. An hour after, walking near the spot where it lay, the sky being perfectly clear, a dark spot in the air at a great distance attracted their attention. It appeared to increase in size, and move directly towards them: as it advanced, it proved to be a vulture flying in a direct line to the dead hog. In an hour, seventy others came in all directions, which induced Mr Baber to remark that this cannot be smell. Dr Russel remembers to have observed at Aleppo, in the most severe weather, when not a speck was to be seen in the sky, if any dead animal was left behind by hunting parties, in the space of a few minutes it was surrounded by birds, although just before none were visible. In the very lowest animals, where only two, or at most three of the five senses are present, we find even here some one of surpassing acuteness.

We are sometimes surprised and puzzled with actions in our domestic animals, which can, however, be often traced to their original instincts. Thus every one has observed how the dog, before he lies down to sleep, turns two or three times round, whether he be going to make his bed on the ground, on a bare floor, or on the hearth-rug. If you ask the reason of this, you will perhaps be jocularly told that it is because he does not know the head of his bed from the foot. It has been suggested, as the true explanation, that in a wild state he takes up his night's quarters in a field of tall withered grass, or among reeds or rushes, and thus wheeling round, he separates the rushes in the spot where he is to lie, so that he forms a bed with overhanging curtains all round for his protection and warmth. The natural instincts may also be strangely altered or modified, as illustrated by the following anecdote of the dog, related by Mr Charles Darwin in his very interesting travels in South America:—

When riding, it is a common thing to meet a large flock of sheep, guarded by one or two dogs, at the distance of some miles from any house or man. I often wondered how so firm a friendship had been established. The method of education consists in separating the puppy, while very young, from the bitch, and in accustoming it to its future companions. A ewe is held three or four times a-day for the little thing to suck, and a nest of wool is made for it in the sheep pen. At no time is it allowed to associate with other dogs, or with the children of the family. From this education, it has no wish to leave the flock; and just as another dog will defend its master, man, so will these the sheep. It is amusing to observe, when approaching a flock, how the dog immediately advances barking, and the sheep all close in his rear, as if round the oldest ram. These dogs are also easily taught to bring home the flock at a certain hour in the evening. Their most troublesome fault, when young, is their desire of playing with the sheep; for, in their sport, they sometimes gallop their poor subjects most unmercifully. The shepherd dog comes to the house every day for some meat, and im-

mediately it is given him, he skulks away as if ashamed of himself. On these occasions the house dogs are very tyrannical, and the least of them will attack and pursue the stranger. The minute, however, the latter has reached the flock, he turns round and begins to bark, and then all the house dogs take very quickly to their heels. In a similar manner, a whole pack of hungry wild dogs will scarcely ever (I was told by some never) venture to attack a flock guarded even by one of these faithful shepherds. The whole account appears to me a curious instance of the pliability of the affections in the dog race. F. Cuvier has observed, that all animals that readily enter into domestication consider man as a member of their society, and thus fulfil their instinct of association. In the above case, the shepherd dogs rank the sheep as their fellow brethren; and the wild dogs, though knowing that the individual sheep are not dogs, but are good to eat, yet partly consent to this view, when seeing them in a flock, with a shepherd dog at their head.

The same author gives a curious instance of the adaptations of an animal's instinct to its peculiar situation. A crab, closely allied to, or identical with the *burgos latro*, inhabits Keeling's island, in the South Seas; it feeds on cocoa nuts, and grows to a monstrous size. It has its great pair of legs terminated by very strong and heavy pincers, and the last pair by others which are narrow and weak. It would at first be thought quite impossible for a crab to open a strong cocoa nut covered with the husk; but M. Leisl, resident in the island, assured Mr Darwin that he has seen the operation frequently performed. The crab begins by tearing the husk fibre by fibre, and always from that end under which the three eye holes are situated. When this is completed, the crab commences hammering with its heavy claws on one of these eye holes till an opening is made, then, turning round its body by the aid of its posterior and narrow pair of pincers, it extracts the white albuminous substance. 'I think,' adds Mr Darwin, 'this is as curious a case of instinct as ever I heard of, and likewise of adaptation in structure, between two objects apparently so remote from each other, in the scheme of nature, as a crab and a cocoa-nut tree.' The *burgos* is dormant in its habits; but every night it is said to pay a visit to the sea, no doubt for the purpose of moistening its branchiae.

THE ALIBI.

SOME twenty years ago (before steam and railroads had annihilated distances, and made 'going to London' the everyday affair it now is from all parts of the kingdom), I awoke, on a beautiful April morning, from the uneasy slumbers of a mail-coach passenger, just in time to drink in, at eye, ear, and nose, the brilliant sparkle, refreshing sound, and reviving odour of my native waves, as they leaped up to kiss, as if in fondness, the rocky barrier which our eastern coast opposes to the not always placid German Ocean. I was, ere long, to pass a barrier of a different description (now happily a nominal one) between two sister nations; or, in plain English, to enter the town of Berwick-on-Tweed, a few miles beyond which, on the southern side of the border, business obliged me to proceed.

At the inn door where we stopped to change horses, in this capital of 'no man's land'—whose inhabitants assert their anomalous independence by speaking a dialect which they take care shall be neither Scotch nor English—I also exchanged, for the brief remainder of my journey, a taciturn, commonplace sort of a fellow-passenger—from whose physiognomy I never dreamed of auguring anything—for one of a very different description, from whose modest, yet speaking countenance, and the evident interest she excited in the few who were astir at that early hour, it was impossible to avoid auguring a great deal.

The coach door was opened, and with swimming eye, flushed cheek, and silver hair blowing about in the

morning wind, a venerable-looking man took leave with even more than parental tenderness of a simply-dressed, yet genteel-looking young woman; who, returning his tremulous 'God bless and reward you!' with an almost filial farewell, drew down over her face a thick black veil, and stepped in opposite to me. I now felt more inclined, and at the same time more at a loss, to open a conversation. To intrude on female sorrow seemed unjustifiable, to treat it with callous indifference impossible. That of my new companion appeared to be of a gentle, subdued sort, arising more from sympathy with others than from personal causes; and ere long, putting back her veil with the reviving cheerfulness of one whose heart is lightened of an unmerited burden, she looked calmly out on the fresh aspect of nature, so in unison with her own pure and innocent countenance, and said, in the tone of one breathing after release from the pressure of painful feelings, 'How beautiful everything does look this fine spring morning.'

'It does indeed,' said I, struck with the confiding aspect of this involuntary remark; 'and I suppose you are the more sensible of it from being a young traveller?' Her only answer was one of those quiet smiles which admit of various translations, and which, coupled with her air of rural simplicity, I chose to construe as assent. Coupling the remark with the circumstance of her only luggage being a small handbox, I set her down for a farmer's daughter of the neighbourhood, and said, 'I suppose, like myself, you are not going far?'

'I am going to London, sir,' said she in a tone of calm self-possession, as if such a journey had been to her an everyday occurrence: and so indeed had been, not metaphorically, but literally the case.

'To London?' repeated I, with more surprise than I could well account for; 'were you ever there before?'

'Oh yes!' was the reply, rendered more *piquant* by its singular composure; 'I came from seventy miles beyond it the day before yesterday.'

It would be quite superfluous to say that my curiosity was greatly excited by this singular occurrence, and I daresay my readers will set me down as a very stupid fellow (for a lawyer especially), for not having the dexterity to gratify it.

But my companion, as if ashamed of having so far committed herself to a stranger, now sat back in the coach, and answered one or two indifferent questions with that laconic gentleness which is infinitely more discouraging than sullen silence. I felt that I had not the smallest right to ask directly, 'My dear, what could make you undertake so long a journey for the sake of one day?' and as I saw she had not the least mind to tell me, I must plead guilty to being ashamed to use the advantage my years and knowledge of the world gave me, to worm out a secret which, from another quiet tear which I saw trickling down behind her veil, I guessed must be fraught with pain rather than pleasure.

The struggle was well nigh over, when the arrival of the coach at my friend's gate gave to my better feelings no very meritorious triumph. Now that all idea of intrusion was at an end, I could venture on kindness; and I said (I am sure in honest sincerity), 'The thought of your going such a long journey by yourself, or with chance company, grieves me. Can I be of any use in recommending you to the protection of the guard, or otherwise?'

'Thank you, sir, a thousand times,' said she, raising for the first time a pair of mild innocent eyes to my face; 'but He who put it in my mind to come, and blessed the purpose of my journey, can carry me safe back again; and I should be silly indeed to mind going a few hundred miles by land, when I am about to sail to the other end of the world. I am much obliged to you, sir, though,' said she, 'all the same for thinking of it; and if we had time—'

Time, however, at all times despotic, is inexorable when armed with a mail-coach horn. I could only

shake hands with the gentle being I left behind me, slip a crown into the guard's hand to look well after her (which I was glad to see he took as a tacit affront), and turn my thoughts, by a strong effort, to my Northumbrian friend's affairs.

These occupied me fully and disagreeably all the morning; and early in the afternoon, I was reluctantly obliged to forego the good gentleman's old claret and old stories (for I had shot snipes on his lands with my first gun some twenty years before), to fulfil an engagement in Edinburgh the following morning. I compounded for this outrage on my friend's hospitality by accepting his carriage to convey me back to Berwick in time for a coach which I knew would start thence for the north in the evening.

No sooner did I find myself once more at the door of the King's Arms, than the circumstance brought full on my memory the romantic occurrence which had been for the last few hours eclipsed behind a mass of dusty law-papers, and the portly persons of a brace of hard-favoured and harsh-toned Northumbrian attorneys.

I found myself a few minutes too early; and as I stood shivering on the steps in the cold evening air, and pondering on the vicissitudes of an April day, I could not help asking the landlord, a civil old-fashioned Boniface—'Pray, sir, do you know anything about the history of that nice young woman who started with me for London from your house this morning?'

'Know, sir!' said he, as if in compassion for my ignorance, 'ay, that I do, and so does all Berwick; and it would be well if all England and Scotland knew it too! If ever there was a kind heart and a pretty face in Berwick bounds, it's surely Mary Fenwick's. But it's rather a long story, sir, and the horses are just coming round. However, I'm thinking there's one going with you as far as Haddington that won't want pressing to give you the outs and ins on't.' So saying, he pointed to a stout grazier-looking personage in a thick greatcoat and worsted comforter, who, by his open countenance and manly yeoman-like bearing, might have been own brother to Dandie Dinmont himself.

'This gentleman,' said the landlord, with a respectful glance at myself and a familiar nod to the borderer, 'wishes to hear all about Mary Fenwick. You've known her from the egg (we've a great trade in eggs here, sir), and besides, were in court all the time of the trial; so you'll be able to give it him, chapter and verse, from the beginning.'

Reserving his breath for the narrative, which his assenting nod to the landlord led me to hope for, my ponderous *vis à vis* adjusted himself in the coach, his broad open honest face inviting question, as much as the poor girl's downcast retiring one had checked it. Having explained, for the sake of propriety, that my interest in the damsel arose from the singular circumstance of one so young and apparently unprotected travelling above six hundred miles to pass one day in Berwick, he civilly begged my pardon, and assured me that no one there felt the least uneasiness as to the success of Mary's journey. 'There's a blessing on her and her errand, sir; and that the very stones on the road know; and besides, she's so staid and so sensible, and has so much dignity about her, that she's as fit to go through the world alone as her grandmother.'

To all this I assented the more readily, that this very dignity had made me forego all inquiry into what I wished so much to know; and even now I listened with all the more satisfaction for the hint she had thrown out, as if of regret for not being able to tell me herself.

'Does she belong to this place,' asked I, 'that you seem to know her so well?'

'Yes, sir, born and bred in Berwick bounds. She was a farmer's daughter, a mile out of town, and just what a farmer's daughter ought to be. Her mother, a clever notable woman, taught her to bake and brew, and knit and sew; in short, everything that many girls in her station are now too fine to do. They think these good old-fashioned things make them ungenteel; but

they never made Mary Fenwick so; for I'm sure, sir, but for her suitable dress and simple manner you might have taken her for a lady.

'Well, Mary came often in her father's little cart to market, to sell her butter and eggs (you heard landlord say these's a most o' them go from here to London), and somehow or other she met with a young man of our town, a journeyman saddler, who was taken with her good looks, and cared for very little else. His old father, however (the old man who put Mary in the coach this morning), made many inquiries about his son's sweetheart; and, as he heard nothing but good of her, had the sense to see that though she was one of a large hard-working family, she would be the very wife to reclaim his gay, idle, thoughtless son, if anything would.

'And very idle and extravagant he was, sir. The only son of people well to do in the world, and a good deal spoilt from a child, he neglected his business whenever he could, and loved dress and company, and horse-riding, and all that, far too well. But he really loved Mary Fenwick; and no sooner saw that she would not so much as listen to him while all this went on, than he quite left off all his wild courses, and became a new man to gain her favour.

'It was not done in a hurry; for Mary had been brought up very piously, and had a horror for everything evil. But Dick Marshall was very clever as well as handsome, and, when he pleased, could make one believe anything; and, to give him his due, as long as he had any doubts of Mary's love, no saint could behave better. At last, however, he fairly gained her innocent heart; though, I believe, it was as much by the aid of his good father and mother's constant praise of him, and dotting fondness for Mary, as by his own winning ways.

'When he saw she loved him—and it was not by halves, though in her own gentle way—he wanted to marry her immediately; and Mary's father would have consented, for it was a capital match for his portionless girl. But Mary said, "Richard, you have kept free of cards and dice, and folly one six months, to gain your own wish; let me see you do it another to make my mind easy, and then I'll trust you till death divides us."

'Dick stormed, and got into a passion, and swore she did not love him; but she answered, "It is just because I do that I wish to give you a habit of goodness before you are your own master and mine. Surely it is no hardship to be for six months what you mean to be all the rest of your life!"

'Richard was forced to submit, and for three of the six months behaved better than ever. But habit, as Mary said, is everything, and his bad for years set the wrong way. With the summer came fairs, and idleness, and pleasure parties, and, worst of all, races, into the neighbourhood. Dick first stayed away with a bad grace; then went, just to show how well he could behave; and ended by losing his money, and getting into scrapes, just as bad as ever. For a time he was much ashamed, and felt real sorrow, and feared Mary would never forgive him. But when she did so, sweet gentle soul! several times—though her pale sad face was reproach enough to any man—he began to get hardened, and to laugh at what he called her silly preciseness.

'Mary was twenty times near giving him up; but his parents hung about her, and told her she only could save him from perdition. And, in truth, she thought so herself; and those who love from the heart, know how much it can bear before it lets go. That thought, joined to the love for him, which was the deeper for its slow growth, made her still ready to risk her own welfare for his.

'It is not to be told what she bore of idleness, extravagance, and folly (for guilt was never as yet laid to his door), in the hopes that, when these wild oats were sown, Richard would settle again into a sober working man. At last, however, to crown all, there came players to the town, and Dick was not to be kept from either

before or behind the curtain. He fell in with a gay madam of an actress, who persuaded him that to marry a poor farmer's daughter was quite beneath him, and to be kept in awe by her more contemptible still.

'In short, sir, to make an end of a long story, Dick, after trying in vain to force his poor heart-broken Mary to give him up, that he might lay his ruin at her door, had the cruelty to tell her one night, as he met her going home to her father's from nursing his sick mother, "that he saw she was not a fit match for him either in birth or manners, and that if ever he married, it should be a wife of more liberal ways of thinking."

'He had been drinking a good deal, it is true, and was put up to this base conduct by his new stage favourite; but when he found that, instead of a storm of reproaches, or even a flood of tears, poor Mary only stood pale and shaking, and kept saying, "Poor Richard! oh, poor Richard!" without once bestowing a thought on his behaviour to herself, he grew sobered, and would fain have softened matters a little. But she summoned all her strength, and ran as fast as she was able, till she came to her father's garden; and two days after, when the old Marshalls drove out in a postchaise to try and make it all up, and get their son put once more on his trial, Mary was off, her parents would not tell whither.'

'And where did she go?' said I, for the first time venturing to interrupt the borderer's *con amore* narrative.

'It came out, sir, afterwards, that, before her marriage was agreed on, an uncle in London had invited her to come up and visit him; and as she had another sister now quite ready to take her place at home, she told her parents it would save her much misery to leave home for a while, and even go to service to keep out of the way till Dick Marshall should be married. "Or hanged!" said her father (in his passion, as he afterwards acknowledged), "which is more likely," little thinking how near it was being the case. There was a salmon smack lying in the harbour just then, whose master was Mary's cousin; so she slipped quietly on board, and got safe to London.'

'How long was this ago?' asked I.

'Oh, about four or five months perhaps,' answered my *vis à vis*. 'Let me see; it was October, and this is April. Well, sir, Mary stayed but a few days with her uncle, as idleness was a thing she never liked; but through his wife, who had been housekeeper to a nobleman, she got a delightful place in the same family as upper nursery-maid; which her gentle manners, and steady temper, and long experience in her father's house among small children, made her every way fit for.

'She had not been long with them when Lord S—— was appointed to a government in India, and as he resolved to take out his family, nothing would serve Lady S—— but Mary must go out with them. They were grown so fond of her, that her services on the voyage would be invaluable; and then her staid, sober, dignified manners, it seems, made her a perfect treasure in a country where, I understand, girls' heads are apt to be turned. Lady S—— knew her story, and thought it recommendation enough. So the parents were written to—half of Mary's ample wages secured to them by her desire; and Mary went down to the sea-side with the family, to be in the way to embark at the last moment when all the tedious outfit for a great man's voyage should be complete.'

'So,' said I, 'that explains a hint she threw out about the world's end. Then she is going to India?'

'Yes, sir; and would have been half way there by this time, if it had not pleased God to send a contrary wind to save Dick Marshall's life.'

'His life, poor wretch!' said I. 'Did he take to worse courses still?'

'Pretty bad, sir; but not quite so bad as he got credit for. I'll tell you as short as I can. There came about Berwick now and then a scamp of a fellow, whom everybody knew to be a gambler and a cheat, and whom none but such idle dogs as Dick Marshall would keep company with. This man, sir, was known to be

in or about town last autumn, and to have won money both on the turf and at the card-table. He and his worthless comrades had a row about it it seems, high words, and even a scuffle; but few knew or cared, and Jack Osborne went away as he came, with none the wiser.

'However, about six weeks or two months ago, it began to be whispered that he had been missed of late from his old haunts, and that Berwick was the last place where he had been seen; and good-for-nothing as he was, he had decent relations, who thought it worth while to inquire into it. The last person in whose company he had been observed in our town was certainly Dick Marshall, who, when asked about him, denied all knowledge of his old companion. But Dick's own character was by this time grown very notorious; and though no one here, from respect to his family, would have breathed such a notion, Jack Osborne's stranger uncle felt no scruple in saying that his nephew had met with foul play, and insisted on an investigation. In the course of this, a very suspicious circumstance came out. A pair of pistols, well known to be Osborne's, was found in Dick's possession; and a story of his having received them in part payment of a gambling debt was of course very little if at all believed.

'There were plenty of people who could depose that, on the 23d of October, at a tavern dinner, the two fit associates had quarrelled, and had high words; though they were afterwards seen to go out separately, but apparently good friends. The next step in evidence was two people having returned late that evening, and, on passing a little stunted thicket about half a mile from town, having heard something like groans and cries, which, however, they paid little attention to, being in a great hurry. This caused the place to be searched; and in an old sand-pit near the spot, to the surprise and horror of all, were found the remains of poor Jack Osborne, whose clothes, from the dry nature of the place, were in good preservation.

'Things began now to put on an aspect terribly serious for Dick Marshall; especially as another man now came forward to say (people should be very cautious, sir, how they trust to likenesses) that he had met Dick, or some one so like him that he had no doubt it was he, on the road to that very spot just before the hour when the groans were heard; though, on being addressed by his name, he passed on and took no notice.

'Between the quarrel, and the pistols, and the groans, and the dead body, and, above all, the evidence of this man, a complete case was made out for a jury; and there were a great many circumstances besides to give it a colour: especially poor Dick's now reckless and profligate habits, and his evident confusion and agitation when first asked where he had been and what he had been doing on the evening of the 23d of October.

'To those who saw his face on that occasion, his conscience-stricken looks when taken by surprise, and his angry defiance afterwards, when aware of the drift of the question, there was no doubt of his guilt. Dick was committed for trial; and, oh sir, it was a sad day for all who knew his worthy parents, and had seen the creature himself grow up before them a pretty curly haired child, and then a manly spirited boy.

'His behaviour in prison was chiefly dogged and sullen. He seemed to scorn even denying the fact to those who could suppose him guilty; as most did, except his poor father, who never could credit it; urging him to think, for the sake of his gray hairs, whether some means or other of averting this sad fate might not yet be found.

'He at length said, though it seemed extorted from him by his parents' distress, "There's one person on earth who could clear me of this horrible charge; but even if she were angel enough to do it, I suppose she's left England—and that's poor Mary Fenwick! This is a judgment on me, father, for my usage of that girl!"

The agonised parents, from what they gathered further, lost not a moment in writing Mary the most pathetic letter ever broken hearts dictated. They

feared she would have sailed; but it pleased God to order otherwise; and instead of the former uncertain delay from contrary winds (which had now set in fair), there was now a fixed detention of one week, for some official reasons.

'Mary carried the letter to her good mistress, and told her all the circumstances; and she readily obtained leave for the journey, and was offered the escort of a fellow-servant; but she was steadfast in declining it. "I would wish no unnecessary witnesses of poor Richard's shame and his parents' sorrow, my lady," said she; "and God will protect one that is going to return good for evil."

'There was not a moment to be lost to let Mary appear at the assizes yesterday, and get back to Portsmouth in time for the ship; so into the mail she stepped, and got here as soon as a letter would have done. When they saw her, the poor old Marshalls almost fainted for joy. They kissed, and wept over her, as they had done many a time when their son's wildness grieved her gentle spirit; but they soon came to look up to her as a guardian angel come to shield their gray hairs from disgrace and despair. They would have proposed to her to see and comfort Richard, but she said mildly, "We have both need of our strength for to-morrow. Tell him I forgive him, and bless God for bringing me to save him, and pray that it may not be from danger in this world alone."

'She was quite worn out with fatigue, it may be supposed, and glad to lay down her head once more to sleep in her mother's room, in the bed where she was born, and where she had hardly expected ever to lay it again. She rose quite refreshed, and able for the hard trial of appearing in court before her whole townspeople on so melancholy an occasion.

'She was indulged with a chair, and sat as much out of sight as possible, surrounded by kind friends, till she should be called on. The case for the prosecution was gone into, and a chain of circumstantial evidence made out so very conclusive against poor Dick, that the counsel against him, a rather flippant young man, remarked, "that nothing short of an alibi could bring the prisoner off."

"And that shall be proved directly, my lord," replied very unexpectedly some of the prisoner's friends. "We have a witness here come more than three hundred miles for the purpose;" and Mary, shaking like a leaf, and deadly pale, was placed in the box.

'The counsel had nothing for it but to examine her. I should be sorry to say he wished to find her testimony false; but really, sir, lawyers have a frightful degree of pride in showing their own ingenuity, and he did not quite like his case to be overturned. At all events, his manner was anything rather than encouraging to a poor frightened girl; but he little knew that Mary, timid as she was by nature, could be firm as a rock when duty was concerned.

'On being desired to say what she knew of this business, Mary simply asserted, in as few words as possible, that Richard Marshall could not have been in Overton wood at the hour mentioned for the murder of John Osborne, as he was at that very time with her on the road to B— farm, in an exactly opposite direction.

"Very pleasantly engaged, I daresay, my dear," said the counsel flippantly; "but I am afraid the court will not be the more disposed to admit your evidence for what passed on that occasion."

"I am sure they ought," said Mary in a tone of deep and solemn sincerity.

"And pray what reason may you have for remembering so particularly that it was the 23d of October, and no other day, that Richard Marshall met you at nine in the evening?" said he, recovering himself. "Richard Marshall met you, you say, on the road to B— at a little after nine on a certain evening. Pray what reason can you give for remembering the hour?"

"Because I had stayed to give his mother her nine o'clock draught before I left; and because, just as I got to my father's gate, the church clock struck ten."

"Very accurate! and pray what led you to be so very positive as to the day?"

"Because the very next morning I sailed for London in a smack, whose sailing day is always on Friday, and Thursday was the 23d."

"Very good and logical indeed. And now, my dear, to come more to the point, how came you to remember this meeting itself so particularly? It was not the first, I daresay?"

"No, sir," said Mary, with wonderful self-possession, "but it was the last! I remember it, because we were engaged to be married; and on that very night, and I bless God it was no other, Richard Marshall told me, and not very kindly either, I was not a fit wife for him, and that all that had been going on between us so long was for ever at an end. I've a right to remember this, sir, I think."

"Mary had made, to preserve her utterance in this testimony, all the exertion nature permitted. She fell back fainting into her father's arms, and a murmur of admiration ran round the court."

"This is an alibi with a witness," said the old shrewd senior crown council. "'Tis not likely a discarded sweetheart would travel six hundred miles to perjure herself for a scoundrel like this!'"

"In corroboration of Mary's simple testimony, should any be required, there was handed to the jury a "housewife," whose few leaves of rude memoranda contained, evidently inserted at the moment, and blotted by a still discernible tear, "This day parted for ever with poor Richard Marshall in this world. God grant we may meet in the next!"

"And did they meet again in this world, sir?" said I, when my honest friend had got rid of something troublesome in his eyes.

"No, sir; Mary thought it was better otherwise, and no one durst press it upon her. She wrote him a letter though, which no one else saw; and I hear he says his life was hardly worth saving since he has lost Mary. Poor wretch! we'll see if this great escape will sober him."

Little more passed between me and my friend, as the lights of Haddington were now in view. I have since been in Berwick, and find Richard lives with his parents, a sadder and wiser man; and Mary is married in India to a young chaplain, to whom Lord S— has promised a living in the north on his return to England.

OCCASIONAL NOTES.

NEW GRAPHIC WONDERS.

SINCE the invention of M. Daguerre, by which nature becomes her own copyist, and imprints by means of her own light the fac-simile of any opaque object on metal surfaces, various new discoveries have been made, and improvements effected, in that extraordinary principle, each more surprising than the former. The latest of these seems to be the climax; for surely nothing can go beyond what we are about to describe.

The January number of the Art-Union contains an account of a process by means of which any sort of engraving, printing, or writing, can be so exactly imitated, that it is next to impossible for the most critical eye to distinguish the original from the copy. Moreover, the transcript is made not on paper, but on a steel plate, and when printed, the impression exactly resembles the original proof or print from which the plate was taken. In short, when once a subject has been engraved, it may be multiplied to infinity.

The nature of the invention enforces that it should remain a secret. "All we know of it," says the editor of the Art-Union, "may be briefly told. Some months ago we stated that a discovery had been made by which, in a few days, a large and elaborate line engraving might be so accurately copied, that there should be no perceptible difference between the original and the

copy; that an engraving on steel or copper might be produced from an impression of the print—the original plate never having been seen by the copyist; and that such plate should be warrantable to yield from 10,000 to 20,000 impressions. We stated, also, that it was stated to us that the producer would undertake to supply a Bank of England note so exactly copied, that the person who signed and issued it should not be able to swear which was the original and which the copy."

In proof of the correctness of this statement, the impression of a plate, produced as above described, is stitched into the Art-Union. It is the head of our Saviour, engraved in the line manner by the well-known French engraver M. Blanchard, from a painting by Delaroché. Having procured an original impression of this plate from the publishers, the editor of the Art-Union handed it to a gentleman who undertook to be the agent of communication, and by whom it was passed to the inventor, who chooses, perhaps wisely, to remain behind the scenes for the present. The promise was, that within a fortnight a plate should be produced capable of yielding impressions which should be the exact counterpart of the pattern print. In seven days an impression was sent to the conductor of the Art-Union, which, in the technical language of engravers, is called 'a proof in progress;' in other words, an impression of the copy-engraving in an unfinished state. In seven days more the plate itself and a 'finished' proof were forwarded; together with the original print, *exactly in the same state in which it was sent*, which, so far from having been destroyed, or even injured, had not a speck upon it. From the plate between four and five thousand impressions were struck off, to be presented to the subscribers, without any perceptible wearing of the plate. Thus the lines and indentations made by the new process appear to be as deep and durable as those of the graver. In short, the copied plate answers the purpose of the original one in every respect.

"As soon," continues the editor, "as the plate was placed in our hands finished, we submitted it to several artists—painters and engravers; at the same time we laid before them impressions from the plate, and a proof of the original plate, taken, of course, in Paris. The opinion at which they arrived was, that although it was not difficult to distinguish the original from the copy, they were so thoroughly alike, that any person of practised eye might suppose the two to be from the same plate, the one being merely taken with greater care than the other; that they were precisely the same, line for line and "touch for touch;" and that this example completely established the principle: they considered the invention to be the most wonderful and the most unaccountable that had been made in modern times in connexion with art."

Upon this evidence, therefore, we must come to the conclusion that the inventor of this process has at his command a power for good of the greatest magnitude: by it he is enabled to multiply the best works of art so rapidly and infinitely, that they will be quite accessible to the humbler orders of people, to spread amongst them the humanising influences of a refined intellectual taste. Nor will the injury to artists and engravers, by this augmented means of production, be so great as they may at first imagine; for, of course, before a copy can be taken, an original must be provided. The engraving must be first made, and as the public taste for prints will naturally increase with the cheap rate at which they will be procured, a far greater demand for originals is to be reasonably expected than exists at present. Thus artists generally will, in all probability, be benefited by the new invention instead of injured. But there is a reverse to these bright considerations. The inventor, besides an influence for good, wields a vast power for evil; for it is clear that he has means of committing forgery to any amount! And not only himself; for so simple is the process—so easy of performance—that he cannot even take out a patent for his invention, as the

specification itself would place it in the power of any person to infringe the patent without a chance of being detected. Nor is it likely that such a secret can be very long retained; it will no doubt be soon universally known, and extensively acted upon.

Innumerable have been the conjectures which have been made, by artists quite competent to form them, as to the process. We have at once set it down to a new and improved application of the Daguerreotype process. Our reason is twofold: first, it is the most obvious mode of accounting for the graphic phenomenon; and next, very good evidence is supplied by the inventor himself. The specimen given in the Art-Union, wonderful as it seems to our unprofessional eye, has, it seems, some minute faults, which are thus accounted for. 'The inventor,' remarks the editor, 'has produced our example under serious disadvantages—being in ill health, having had to work in dark and frosty weather, and having been far too much hurried by us, in consequence of our desire to issue our copies with our January part. Moreover, the steel was not prepared expressly for the purpose, and was by no means fortunate for work.' Now, unless light and the atmosphere were the main agents in producing the plate, the excuse of the dark and frosty weather would not have been made.

But even with this startling novelty, the wonders of graphic art are not exhausted. Another gentleman, whose name is no secret, Mr Joseph Woods, of Bucklersbury, London, is the inventor of a process called Anastatic printing. It is the reproduction of any form of letterpress, or any quality of print, drawing, engraving, or lithograph, in unlimited quantity, in an inconceivably brief space of time. Any journal—say for instance the Times—might in twenty minutes be prepared for reprinting merely from a single number, and worked off with the ordinary rapidity of the steam-press. In less than a quarter of an hour from the time of receiving the sketch, the printer will present to the artist proofs of his work, which shall resemble the original as perfectly as if it had been reflected on the paper touch for touch. We shall not be far wrong, perhaps, in attributing this invention to a more perfect process of electrotyping than has hitherto been attained.

In contemplating the effect of these astonishing inventions, it is impossible to foresee their results upon the ordinary transactions of life. If any deed, negotiable security, or other legal instrument, can be so imitated that the writer of, and subscriber to it, cannot distinguish his own handwriting from that which is forged, new legislative enactments must be made, and new modes of representing money, and securing property by documentary record, must be resorted to. A paper currency and copyhold securities will be utterly useless, because they will no longer fulfil the objects for which they, and instruments of a like nature, are employed. Again, the law of copyright as respects literary property will have to be thoroughly revised. Let us, for an instant, view the case in reference to 'The Times' newspaper. Suppose an early copy of that powerful journal to be some morning procured, and anastatyped in a quarter of an hour. The pirated pages may be subjected to printing machinery, and worked off at the rate of 4000 copies in each succeeding hour, and sold to the public, to the ruinous injury of the proprietors. The government newspaper stamp would be no protection, for of course that could be imitated as unerringly as the rest. This, too, is an extreme case against the imitators; for a newspaper would have to be done in a great hurry. Books, maps, prints, and music, could be pirated wholesale, and at leisure.

Let us not be understood to apply any of these remarks to the inventors, as presuming for an instant; or by the remotest hint or inference, that they would be guilty of unworthy conduct. We merely state what is, we fear, inevitable when their inventions become public property, which, according to our information, from their extreme simplicity, is likely very soon to be the case.

'OLD CRUSTED PORT.'

If the lovers of 'old crusted port' were aware of the manner in which their much admired crust is frequently produced, they would certainly be less disposed to take so fallacious a standard as a test of excellence. The tricks of the trade are vividly exposed in the following notice—taken from the proceedings of the London Chemical Society—respecting the composition of certain kinds of green or bottle glass:—Some green glass bottles had been submitted to Mr Warrington of Apothecaries' Hall for examination on the ground of their having imparted a bad flavour to the wine contained in them. On inspection, they were found to have the inner surface rough and opaque, and to be readily acted upon by tartaric acid. A comparative analysis of the glass of these bottles with other green glass, showed that a large preponderance of bases, especially lime, had been employed in their fabrication. A few of the objectionable bottles were then filled with dilute sulphuric acid, and placed aside. After the lapse of a fortnight the bottles cracked, and the fluid escaped; and upon examination they were found to be incrustated over the whole of their inner surface with sulphate of lime, to the thickness of a copper penny-piece—the liberated silica being partly washed away in a gelatinous form, and partly enclosed in the crystalline mass. Mr Warrington stated that a considerable quantity of wine had been bottled in this glass, one merchant alone having, to his knowledge, bottled three hundred dozen, the manufacturer alleging that in these 'improved' bottles the crust of port wine would form earlier, and adhere firmer to the glass than in ordinary bottles.—In the remarks that followed on Mr Warrington's paper, it was stated, that so imperfectly fabricated were some kinds of green glass, that even a little free acetic acid in porter was known to have acted upon them. It was further mentioned that barytes was occasionally used in the manufacture of green glass, an excess of which, forming a soluble silicate, would be most deleterious; and, indeed, that almost all the glass of this sort now fabricated in Britain contained some soluble silicate.

This is certainly no very flattering account of our manufactures; but your connoisseurs in wine are much to blame for it. Mr Jones must have his 'old crusted port'; but Mr Smith the wine merchant, however anxious to oblige, cannot produce age at pleasure. He applies in his difficulty to Mr Brown the glassblower, and he with a few bushels of lime settles the matter in a twinkling. Of course Mr Brown, in his anxiety to produce a ripe old age on 'the shortest possible notice,' is very liable to overstep the exact per centage of lime; and thus Mr Smith occasionally pays his three hundred dozen as the penalty of fraud and dissimulation. Lucky are all such cases for poor Mr Jones, who, in his love for 'crust,' might otherwise have had his stomach absolutely lined with plaster of Paris, besides being ballasted with calculi to an indefinite amount.

A SUGGESTION TO MARINERS.

Very great inconvenience arising at all times, but particularly in bad weather, from the want of light in the ordinary mode of lighting vessels—binnacles not casting a sufficient light on the compasses, which, in fact, are often thrown into a shadow by the vessel rolling or pitching heavily—the attention of the maritime public is called to the following simple and cheap expedient for completely obviating the evil.

In all binnacles fitted in the ordinary mode—that is, with a light placed between two compasses—if small mirrors are placed, one on each side of the binnacle, opposite the light, taking care to fix them in the angle that fully reflects the light on the cards, the light being also a fixture, then, however much the vessel may labour, the cards will always be well illuminated, and when the vessel is comparatively easy, the cards will receive a very great increase of light.

We present this note at the suggestion of Lieutenant

Cox, commander of her majesty's revenue cutter *Lapwing*, whose mind was directed to the expedient in consequence of his own vessel's very quick motion, and who found it to answer to his complete satisfaction. The required mirrors cost about two shillings, and the result is equal to that of an apparatus which cannot be obtained under eight or nine pounds.

LOITERINGS IN FRANCE—1844.

BEAUCAIRE—ARLES.

We were left in a broiling heat at Avignon, our only chance for fresh and somewhat cool air being a walk at dusk upon the long suspension-bridge which here crosses the left branch of the Rhone. On the third day, finding no vessel descending the river at a convenient hour, we departed from this ancient city by means of a *voiture* for Tarascon, another town about eighteen miles further down the Rhone.

The journey was destitute of general interest, and to us only amusing from the nature of the road. Having at two or three miles' distance from Avignon crossed the Durance by a long temporary bridge, the principal suspension one having been destroyed by a torrent some time before, we got into a tract of country apparently resting on limestone, of which the road was composed. The stones, ground by heavy roulage, formed a fine whitish-brown dust several inches deep, and this, raised by a breeze which had arisen, swept in clouds over the face of nature. Hedgerows, trees, fields, houses, were universally covered, as if under a snow storm. The drift drove in the faces of men and horses, shrouding them with its odious particles. Suffering the melting heats of summer, we appeared to be wandering in a dreary waste in the heart of winter. Never till now did we feel the force of the observation made by travellers, that in the southern parts of Europe there are, practically, two winters in the year—the winter of winter, and the winter of summer, in either of which work out of doors is unpleasant or impossible.

In due time we got into Tarascon, a poor old town, whence we crossed the Rhone, by a suspension-bridge of magnificent proportions, to Beaucaire, another town equally old and dull, but now the scene of an annual fair, the largest of its kind in Europe, which we proposed to see before going further. This, however, we soon discovered to be no easy matter. Embosomed still more in the limestone district of the south, the town was at present retired from public observation. It lay concealed in a cloud of the everlasting dust, and to get into its streets, one required to walk backwards and sideways with his face carefully buried in his handkerchief, feeling his way all the time with his feet. By dint of edging ourselves along in this curious fashion, we were enabled to reach a point on the quay, where numerous booths and tents were pitched for the accommodation of tradesmen with their goods. Here, from the general shelter afforded by these erections, as well as the concourse of people, the dust had comparatively little scope for its vagaries, and we were now permitted to look about us.

From the boulevard or quay adjoining the Rhone, we wandered into the heart of the town, everywhere finding the streets and lanes choked with people and merchandise. The scene was striking, and unlike anything we had seen before. Across the narrow streets were stretched gaudy sign-boards of yellow, red, and blue cotton, forming a brilliant perspective of colours, while above, from the tops of the houses, coverings of white linen were placed, to shelter the passengers and goods beneath, alike from the sun and the dust blown from the environs. Much of the merchandise was out of doors, ranged along the walls; and the fronts of the shops being quite open, like booths, everything was exposed to view. From flaunting signs overhead, we perceived that there were merchants from places in France hundreds of miles distant—cutlers from Thiers, jewellers

from Paris, wine dealers from Bourdeaux, drapers and haberdashers from Lyons, booksellers from Limoges, gunmakers from St Etienne, and so on; tradesmen bringing their wares from the most remote localities. There were also not a few foreigners—Turks, Spaniards, Italians, Swiss, Greeks, Armenians—but not, as far as we could see, a single Englishman. Some streets were apparently devoted to wholesale dealings, and there carts were loading and unloading, and porters busy packing and carrying goods to and fro. Others were laid out for retail, and classified according to trades. One booth contained nothing but small spinning-wheels, such as were used by our thrifty grandmothers before factory spinning unsettled and uprooted domestic manufactures. It was interesting to observe, from the exhibition, that the housewives and maidens of the south of France were only beginning to use that which had been forty years ago thrown aside in the greater part of Scotland. To these good dames and demoiselles the spinning-wheel, antiquated as we are disposed to think it, is an engine greatly in advance of what it superseded—the distaff—which, till the present moment, is as common in France as it was two hundred years ago in England. The spectacle of a country girl carrying home a spinning-wheel from a fair would now be considered an oddity in our own country.

The fair of Beaucaire is of great antiquity, and keeps its ground among many declining usages. Yet it is considered to be falling off, like other assemblages of the kind. Commencing on the 1st of July, it lasts the whole of the month, and attracts a hundred thousand persons from all surrounding and many distant places to make purchases. The heaviest part of the business is transacted, I was told, two or three days before the fair commences. The day of our visit was almost at the close, yet the bustle was considerable, and without any external appearance of soon abating. When finished, and all trace of the concourse removed, the town subsides into little else than a city of shut and empty houses; and were its fair extinguished, it would speedily fall into a state of neglect and ruin. The advantageous situation of Beaucaire for this great annual market, on the lower part of the Rhone, has been improved by the opening of a canal which leads from the Rhone immediately below the town across the country to the Garonne. On the banks of the canal and of the river, the traffic of barges, from the glance we had of it, seemed to be on an extensive scale.

It being useless to attempt remaining in a town during such a paroxysm of trade, our party gladly took advantage of a steamboat whose boiler was hissing at the quay, and by it we were carried rapidly down the Rhone towards Arles, which we designed should be our quarters for the night.

In descending the river from Beaucaire, the country on both sides begins to assume the character of a flat and marshy delta. The stream, hitherto impetuous, slackens in its speed, and winds through a region destitute of any object of interest, and in some places the view from the steamer is shut in by clusters of willows which flourish on the banks of the river, and on large flat islands round which the vessel toils its way. At the distance of about twenty-five miles from Beaucaire the river parts in two, a lesser branch going off on the right, called the Petit Rhone, while the larger keeps on its way to Arles, now near at hand. Our approach to the venerable city is indicated by the emerging of certain old gray buildings from behind the willow bank on our left, and amidst which is observed rearing its gigantic form the ancient Roman amphitheatre for which Arles has obtained such distinction. The town generally being situated on a low rocky protuberance, near the summit of which the amphitheatre is placed, the approach from the river is favourable for taking a comprehensive view of the place.

Arles, once the Roman capital of Gaul, and afterwards the chief city of Trans-Jurane Burgundy, is now a poor old provincial town of France; but, possessing an

abundance of magnificent ruins, the spectral relics of former glories, it is still impressive in its decay, and commands our respect as well as our commiseration. While Arignon is alone distinguished for the degenerate remains of middle-age architecture, Arles exhibits some of the grandest specimens of the best ages of Rome—magnificent and more perfect than almost anything of the kind in Rome itself.

We spent a day at Arles roaming amidst its ruins; but an antiquary, who did not mind modern discomforts, might well spend a month. The thing which attracts one the moment he arrives is the amphitheatre. Wending our way through some narrow and crooked alleys, in a direction eastwards from the central Place of the town, we came upon this remarkable edifice, which, by some recent alterations, has been liberated from contiguous and mean buildings, and now stands aloof, surrounded by an iron railing. It is difficult to know how to describe such a vast and curiously constructed mass. Exteriorly, we have before us a gray sandstone structure, oval in form, consisting of two storeys of pilasters, with windows or openings, the whole rising from the ground a height of seventy to eighty feet. The lower storey is Doric, and the upper of the Corinthian order, and being mostly composed of large blocks of stone, the surface is wonderfully entire. Where time or violence has seriously damaged the pilasters or arched openings, the French government, greatly to its credit, has effected repairs by the introduction of new stones. Neither the large arched openings in the lower storey, anciently used as the vomitoires or outlets, nor the openings above, point inwards in a direction parallel with each other. It is remarked, that all the arches are concentric; that is, proceed towards the centre of the oval; an arrangement which must have been accomplished with much additional trouble to the planner and builders. Although now liberated, as I have said, from clusters of parasitic edifices, the building is not approachable on every point, for one side rests on an elevated part of the rocky knoll, which mars the general unity of the exterior wall.

The only entrance now in use is at the western extremity, and by this we were admitted through a lofty arched passage to the interior of the structure. Walking forward, we are in the middle of a flat space, the original though partially broken floor of the arena, and around us, from the top of the podium or bounding parapet, to the summit of the outer wall, are seen gradually ascending rows of stone seats. The rows, however, are greatly broken in some places, and in others they are entirely gone, showing the ghastly fragments of arches which once supported them. The whole interior area, including the space covered by seats, measures an oval of 459 feet in length, and 338 in breadth, and accommodated 25,000 spectators. There never was any roof. All is open to the sky; but, from poles fixed in the upper part of the outer wall, awnings were drawn across to shelter the spectators from the sun.

The ascent to the seats was by stone stairs leading from different entrances, and several stairs still remain. The visitor of the ruin, however, gains the top by arched doorways in the podium opening on the arena, through which the wild beasts were wont to be ushered from dens in the interior of the building. We were conducted into these dismal recesses, where were pointed out the dingy vaults in which these ferocious beasts, and also the unfortunate beings whose doom it was to encounter them in the arena, were separately confined. From these gloomy passages we ascended by one of the stairs to a part of the amphitheatre the least decayed. Here, sitting down, we could estimate the imposing scene which the place must have presented when filled with spectators. From the front, or lowest, to the topmost seat, we reckoned, as nearly as possible, thirty rows of stone benches, each from sixteen to eighteen inches broad, by about the same in depth; by which means, every block or bench, while serving as a seat for one party, accommodated the feet of the party immediately behind. What seemed a little puzzling, no two rows

were alike in dimensions, though quite regular in general aspect. Probably the accommodation was suited in some degree to the different ranks of spectators.

The spot on which we had seated ourselves was in the southern side of the oval, midway from the front to the upper extremity. Here the seats seemed most entire, and we were able to count at least twenty rows together in a nearly undamaged condition. So huge are the square blocks of stone forming the seats, that great violence must have been employed to uplift and destroy them. In all probability, they were abstracted as building materials for the numerous churches and convents which were erected in the town during the middle ages, or for the walls and towers raised in defence of the place.

At present, all cumbrous rubbish being removed, leaving the ruin clear, we are enabled to note with perfect accuracy the internal organisation of the structure. Except, indeed, that large patches of the seats are gone, exposing the tops of the arches which bore them up, everything is much in the state in which it was left by the Romans, although fifteen hundred years have elapsed since they set their foot within it.

It is only, I imagine, by a visit to such a place that one can fully realise an idea of the barbaric amusements of the Roman people. Here the thing is before us, an undoubted substantiality. The stories of gladiators fighting against each other in the arena—of unhappy Christian captives being set upon by savage beasts of prey—of slaves and malefactors condemned to wrestle in deadly struggle, all for popular amusement, are felt to have been no fictions, but sad realities. From the bench whence we now looked down on the arena, doubtless, had been shouted the horrid *hoc habet* which signified the death-wound of the unfortunate combatant, accompanied by the ominous turning downwards of the thumbs, which bade the conqueror despatch his victim. Realising, by a small stretch of fancy, the spectacle of such barbaric amusements, a visit to the amphitheatre of Arles likewise affords a vivid notion of the greatness of the Roman people in works of art. Although much smaller than the Coliseum at Rome, the edifice we are now visiting is nevertheless on a stupendous scale, and the cost of its erection must have been enormous. It affords a lively illustration of the importance in the Roman state of that privileged class, usually called 'the people,' but in reality a burghal aristocracy. Amphitheatres were erected for the amusement of this class in Nîmes, and other places comparatively of a provincial character, and all the entertainments were provided at the public cost. The only restriction consisted in taking the seat which was assigned, and this was regulated by rank and other circumstances. In the front, next the podium, were placed the senators, ambassadors of foreign nations, and also, in a particular seat, the emperor, or his representative the prefect. Next were seats assigned to the judges and ordinary magistrates; these, as well as the seats in front, being provided with cushions. The next higher rows, styled the *popularia*, were of right taken by 'the people.' And the uppermost and most distant benches, like the galleries of modern theatres, were appointed to the inferior orders and slaves.

Not to dwell unnecessarily on these slight illustrations, we may now quit the spot where we have been a few minutes ruminating, and ascend the sloping rows of steps to the top of the building. Here a more commanding view is obtained: but we may go still higher, and look without as well as within the amphitheatre. Conducted by our guide, we were led up a narrow stair to the top of a massive square tower on the outer wall. This tower, which is a comparatively modern excrescence, is matched by another on the opposite side. Both are understood to have been erected about a thousand years ago, when the building was used as a fort either by the Saracenic intruders in this part of France, or by the native powers who expelled them. Other two similar towers—four having been erected—are now gone.

From the lofty situation we had gained, we had a wide and uninterrupted view over the town immediately below us, and of the great marshy plain beyond, which stretched southwards to the Mediterranean, and through which the branches of the Rhone were threading their way amidst groves of willows—the whole a dreary flat, whence the heat of the sun was raising an unwholesome mist. On descending to the arena, we looked round for some kind of inscription, but were not more successful in the search than hosts of antiquaries who had gone before us. Faint traces of characters are alone visible on the broken marble slabs which face the podium. It is understood that the building was erected in the reign of the Emperor Titus, nearly eighteen hundred years ago.

Our next visit was to a singularly beautiful relic of art, which has lately been exposed to view at a short distance from the amphitheatre, on ground a little more elevated. This is the fragment of a Roman theatre, which had for centuries been partly buried in rubbish, and partly engrossed in some mean domestic structures. The principal objects now standing exposed in the midst of the excavation are two marble columns of the Corinthian order, surmounted by a portion of elegant entablature. These had formed pillars of the scene, others for a similar purpose being destroyed, and lying in pieces on the ground. Part of the flight of stone seats for the audience is also entire, with some portions of walls used for the orchestra and the support of the stage.

Throughout the town there are other antiquities worth visiting, and a museum of relics formed in a disused church; but any notice of these would not afford matter of interest to the reader, whom I therefore invite to follow us in our next move in quest of the picturesque. This was no less than a voyage by steam back to Beaucaire, where, having once more groped our way through a whirlwind of limestone dust, we were so fortunate as to find seats in a railway train ready to set off for Nîmes. This was a journey of more than twenty miles, but was rapidly performed, and the only discomfort attending it was the blowing of one of those strange gusty winds which haunt the borders of the Mediterranean, and whirl not only dust, but small stones and other light objects into the atmosphere.

BENEFICIAL CO-OPERATION OF THE WORKING-CLASSES.

We have had a vast number of inquiries regarding the article which under this head appeared in the Journal on the 4th of the past month; and with a view to supply such further information as may enable bodies of workmen to enter into arrangements similar to those existing amongst the men employed by Mr Ramsay in the lighting and cleaning departments of the Edinburgh police, we lay this article before our readers. With those who, like ourselves, take an interest in everything which concerns that great mass of our countrymen who earn their bread by bodily labour, any measure tending, in however small a degree, to ameliorate the hardships and distresses incident to their condition in life, will always be viewed with a high degree of interest and favour; and if there be any considerable number of persons who entertain the opinion that the working-classes themselves are disposed to look with apathy and indifference on schemes of this character, we have only to refer to the multitude of inquiries produced by our notice of the scheme in operation amongst Mr Ramsay's men, as a conclusive and satisfactory reply. It is indeed pleasing to find large bodies of workmen in every district of the kingdom eager and anxious for information as to the means of emancipating themselves from the thralldom and degradation of dependence on charity, and entering with earnestness and avidity into the consideration of a scheme which repudiates eleemosynary aid,

and trusts only to that relief and assistance which it purchases and pays for, and which, for a given consideration, it is entitled to demand.

Mr Ramsay's scheme is of a twofold nature, and although its two branches are substantially separate, they admit of easy and beneficial combination; or, where their junction may be unnecessary, may be carried on separately. As stated in our previous article on this subject, the first is a benefit scheme, in the usual and proper sense of the word, securing an alimentary allowance, and medicine and medical attendance for the sick and hurt; an allowance for funerals; and finally, the division of the whole funds in hand at Martinmas and Whitsunday in each year, in exact proportion to the contributions. This branch of the scheme is compulsory, and contributions at the rate of 6d. per man per week is one of the conditions of obtaining employment in the establishment. The contributions are retained from the wages, and placed in bank weekly as collected. Nothing can be simpler, more efficient, or more easily worked than this important branch. A card, with the designation of the scheme printed upon it, is put into the hands of each of the men, and on these cards each man legibly and accurately writes his address, and when illness occurs in his family, sends it to the medical officer, who, on receiving it, immediately visits and redelivers the card, that it may be in readiness for the next occasion. If it happen to be the man himself who is taken ill, he sends notice also, on the first day of his illness, to his overseer, or to a member of the visiting committee, and on pay-day (Wednesday) presents an application, upon a printed form which is furnished to him, for aliment; and, on this being subscribed by the medical officer, he receives his allowance of 9d. per day. Aliment, however, is not allowed to any one who has been less than fourteen days on the establishment from the date of his last appointment, nor whose illness has been brought on by his own misconduct. Those receiving aliment are not permitted to be out of their dwellings after eight o'clock in the evening, on pain of being struck off the roll of the establishment, and deprived of all further benefit; and *no aliment is allowed to those in receipt of any public charity*. Funeral money is paid on a certificate of death by the medical officer, and of interment by a member of the visiting committee; and if a coffin be required from the undertaker having the contract for furnishing them, the price is retained out of the funeral money. If the funeral money shall not be claimed till the second termly division after the death of the party, it is then to be distributed as a part of the free dividend; *but no funeral money is allowed in any case where the expenses of the funeral are defrayed in whole or in part by the parish or other public charity*; and the committee, if they see cause, may withhold payment till a receipt for payment of the churchyard dues is presented to them.

In so far as a mere benefit scheme goes, these arrangements seem at once simple, judicious, and comprehensive, and afford in a limited degree nearly all the advantages which can be derived from any similar design. The allowances both for sickness and funerals are no doubt small, but then the wages of the men are not such as enable them to afford a high rate of contribution. This, however, is the less necessary, as they are all strongly urged to enter at least one other benefit society, and thus to a certain extent to protect themselves against one of the worst evils of sickness in the house of the working-man—that of poverty—a recommendation which, almost without exception, has been acted on. The cost of these advantages is incredibly small. The whole expenditure for the half year ended 15th November last, for aliment, at 5s. 3d. per week, being only L.3, 8s. 7½d.; and for funeral money, at the rate of L.4, L.3, and 15s., for a man, a wife, and child respectively, only L.12, 5s., the strength of the establishment during that period averaging 152 men. The average cost to each man for aliment, therefore, is only a fraction more than 5½d. for the half year, or eight-tenths of a farthing per man per

week. In like manner, the cost to each man for funerals is a fraction more than 1s. 7½d. in the half year, or almost exactly three farthings per man per week. The conjoined expense of these two important items is only 1s. 15, 18s. 7½d., and the aggregate cost per man 2s. 1d., or rather less than 1d. per man per week. These, added to the fixed allowance of 2d. per man per week to the surgeon, amount to a total expense of 3d. per man per week nearly, being rather under the one-half of the sums retained as contributions, and enabling the committee to return 6s. 6d. to each man out of 13s. contributed within the half year. The past season, to be sure, has been a remarkably healthy one; but the wages must be miserable indeed which cannot afford so small a sum wherewith to purchase so many advantages.

From an elaborate table of statistics, prepared by Mr Ramsay, applicable to a period of five years, and laid before the commissioners of police, when the benefit scheme was under their consideration, it appears, that in a number of yearly societies, where a similar amount of benefit is rendered as in that of the police, comprising an annual aggregate of 1823 members of all ages—from 15 to 60—the average cost for aliment was three farthings per member per week; and for funeral money, a sum represented by a decimal of '98, or something less than a penny. This is higher than the police scheme has yet cost; but as many of the members of which these societies are composed are persons by no means in robust health, the avocations of another portion sedentary and unhealthy, and the ages of a considerable section unfavourable, Mr Ramsay's scheme, making a slight allowance for the circumstance of an unusually healthy season, and also for the accounts being applicable only to the summer half year, which is known to be healthier than the winter, may be taken as a close approximation to the expense of maintaining a society where all the members are able-bodied workmen engaged in out-door employment. When a higher rate of benefit is required, or where circumstances exist unfavourable to the health of the members, an increased rate of contribution is of course necessary.

It is proper to notice a circumstance which has in some measure no doubt beneficially affected the results of the police benefit scheme, and that is, that, as a body, they are probably not excelled for sobriety by any similar number of men of their own rank in the empire; a remarkable and gratifying proof of which is to be found in the fact, that during the whole of the holidays at the end of 1843 and the commencement of 1844, out of 180 men then employed, not one was known to have been in the slightest degree under the influence of liquor.

Arising out of the benefit scheme, and closely connected with it, came a co-operative scheme, scarcely second in importance and advantage even to the former. The purpose of this was to procure certain necessary articles for the use of the men at the lowest wholesale prices. The idea, we believe, was suggested by an article which appeared in the Journal on the 11th of May last, and adopted immediately thereafter. It was then proposed to enter into a contract for bread; and when it is stated that, as soon as the matter became known, although the committee limited their applications for offers to a small number of bakers of the first respectability, known to sell only bread of the first quality, they had offers from several persons to furnish it at 16 per cent. discount from the ordinary selling price. These the committee rejected, and contented themselves with a much lower rate of discount, on the ground that they wished the contractor to realise a fair profit, and furnish an unexceptionable article both as to weight and quality. The value of this contract may be conceived, when it is stated that several of the men required seven loaves a week each for their families; and for a considerable period after the contract was entered on, the consumpt varied from 360 to 420 loaves weekly.

The next article contracted for was the best oatmeal, delivered in quantities of not less than a firiot (35 lbs). This is furnished at the lowest wholesale price, being

generally upwards of a penny a peck under the retail price. A peck is seven pounds.

A contract for coal was then entered into from a particular pit, where the coal was known to be of excellent quality. A fixed price at the pit was agreed to, and a person engaged to deliver coal in quantities of not less than half a ton as required. The price, including cartage, was only 8s. per ton, and as the article is of very superior quality, it has given great satisfaction. Nearly all the men were in the practice of purchasing coal in single hundredweights, for which they paid from 7d. to 8d., being from 11s. 8d. to 13s. 4d. per ton, and of a quality greatly inferior. The comfort and economy of thus obtaining coal in cart-loads at a low rate is of great value, and has been fully appreciated.

In October, the committee bought several hundred bolls (4 cwt. to a boll) of potatoes from a farmer, upwards of 300 bolls of which are already delivered; they are furnished in quantities of not less than half a boll. Some of the men use six or seven bolls in the season, the average being from three to four.

The purchase of other articles has been contemplated; but as yet it has been limited to those we have enumerated. One obstacle in the way of extending these contracts will readily present itself, in the difficulty of thoroughly specifying and defining the quality of the articles required. The principle adopted by Mr Ramsay on this point, is to contract only for such articles as admit of easy comparison with a sample, or which may be specified with so much precision as to quality, conditions of delivery, &c. as not to admit of dispute. Where one or other of these rules cannot be applied, the trust must be in the mutual understanding and good faith of the parties.

When the co-operative branch of the scheme was suggested, the first obstacle arose from the want of funds. In order to form a small capital, it was agreed that the surplus cash belonging to the benefit scheme should be applied to this new purpose; and to augment this stock, as well as to establish the individual credit of the men, each of them subscribed such small sums as their means could afford, and as their requirements as to the articles contracted for rendered necessary. In this way each man became possessed of an immediate interest in the fund to the extent of the value of his share of the surplus of the benefit scheme, and of the capital he paid in added together, and to the amount of these at least he was entitled to be supplied with such articles as were contracted for by the committee. Many of the men, besides, found it a most useful place of deposit for such little savings as they could from time to time spare from their wages. Deposits, varying from sixpence to three and four shillings a-week, were accordingly made; and as these might at all times be got up on demand, under deduction only of what might be owing to the scheme, sums were accumulated for the purchase of shoes, or clothes, or the payment of rents, and other necessary purposes, which, in some instances at least, would probably have been squandered on less important articles.

The wages of each man being paid with the utmost regularity, it was laid down at the outset, as a fixed rule, that, supposing a man were supplied with bread, meal, coal, or potatoes, from the scheme, he should make a weekly payment equal to the extent of his weekly consumption of the articles furnished. A man, for example, who required four loaves of bread in the week, a firiot of meal in a fortnight, a boll of potatoes in a month, and a ton of coal in three months, paid for the whole of the bread, the half of the meal, the fourth of the potatoes, and the twelfth of the coal, every week. In this way they paid exactly for what they got, at the same rate per week as if the articles had been served out of a shop in weekly quantities; with this important difference, that articles of the very best quality were supplied to them at the very lowest wholesale prices.

It happened frequently—indeed almost constantly—that men with large families required to order articles

probably to twice or thrice the amount of their interest in the fund; and in order to accommodate them, and at the same time to protect the committee, whose services in the whole business are purely gratuitous, a printed form of application for the articles was prepared, authorising the committee, in the event of the applicant leaving the establishment while any part of the articles were unpaid, to uplift whatever money might be due to him either on account of the benefit scheme, the co-operative fund, or for wages, and to apply it in liquidation of any claim against him for articles furnished. A printed form in similar terms is also, in such cases, required to be subscribed by two persons on the establishment as cautioners, so that the committee are, on the whole, tolerably well protected against loss by bad debts.

The clerk for the benefit scheme is also clerk for this branch, and no goods of any description are furnished to any one except on his order.

The benefits arising from these conjoined schemes are probably more numerous and important than may at first sight appear. The first and most obvious are clearly the providing a means of relief when the men are laid off work by sickness, and the payment of a sum on the death of any member of the family, for the purpose of defraying the funeral charges. Next to these in importance is the arrangement for providing medical attendance and medicine to the men and their families. The surgeon being elected by a committee appointed for that purpose by the men themselves, the utmost confidence is placed in his professional skill, while the right to demand his services in any emergency, and the consciousness that these services are paid for, elevates them in their own estimation, and places them in a position in all respects superior to those who are under the necessity of begging medical relief as a charity, and of submitting, as sometimes happens, to be treated by persons in whose skill they have not the confidence usually inspired by previous personal acquaintance. The division of the surplus funds at Martinmas and Whitsunday becomes an important contribution towards the payment of the house-rent falling due at these terms; and to those who do not require it for that purpose, it comes opportunely either for the purchase of articles of dress, or as a nucleus to which further savings may be added. Amongst its negative merits, it may be mentioned that its meetings are never held in taverns, and that it is conducted without expense. But benefits of a higher, more ennobling, and more important character than those which pertain to the mere saving of money arise from this scheme, from the feeling of independence which it inspires and fosters, and from the boldness and manliness with which it trusts to its own efforts alone in its discarding of all reliance on extrinsic aid. That feeling, also, which is the very bane of the working-classes—want of confidence in each other—is here practically subdued; their interests inseparably united; and individual wants and afflictions felt as matters in which all are concerned. We had almost added, that their sympathy for each other was promoted; but the writer of this article well knows the generous and kindly hearts of that portion of his brethren whose hands are hardened with daily toil; and if there be any class of his countrymen whose charities towards each other never fail, it is that of the humblest, the hardest worked, and the worst paid among them. He could tell of patient endurance, of self-denial, of exalted generosity, all calmly and unostentatiously exercised, and all unheard of by that mass of persons who call themselves the world, which would make the ears of the coldest tingle, and the proudest hang down their heads.

It is perhaps scarcely necessary to add that any body of men, consisting of a dozen or upwards, may enter into the whole or any part of these schemes. If the benefit scheme only be adopted, and if the number be very small, the benefits might either be longer deferred, or money borrowed to meet such contingencies as require

a larger sum than may be on hand at the time. A better way, perhaps, is to make no division of the funds for the first year, except in the case of members who may leave, and to retain the amount acquired as a sort of standing capital. A year's contributions would thus always be on hand to cover any demands that might occur.

LONDON FOGS.

Fogs, says Mr Main, are more dense about London, and probably all other great cities, than elsewhere, because the vast quantity of fuliginous matter floating over such places mingles with the vapour, and renders the whole so thick, that a noonday darkness is sometimes produced, rendering candles and gas-lights necessary for the transaction of the ordinary business of the shops and public offices. Such circumstances happen frequently during winter; but on some occasions (as about two o'clock p.m. on the 27th December 1831) this darkness is truly awful. This extraordinary appearance is, however, caused by a very ordinary accident, namely, a change of winds, and which may be accounted for as follows:—The west wind carries the smoke of the city to the eastward, in a long train, extending to the distance of twenty or thirty miles, as may be seen in a clear day by any person on an eminence, as, for instance, at Harrow-on-the-Hill. In this case, suppose the wind to change suddenly to the east, the great body of the smoke will be brought back in an accumulated mass, and as this repasses the city, augmented by the clouds of smoke from every fire therein, it causes the murky darkness alluded to. This effect of the smoke being thrown back on its source may be easily conceived; indeed it may be seen, under favourable circumstances, first reverted, and gradually accumulating, till it is dispersed on the opposite side; but wherever the accumulation is, in its progress backwards there will be an unusual degree of darkness. It is to be observed, that the cause of fogs is also the cause of the smoke floating near the earth; and, of course, where there is so much of the latter, the former is doubly dense. Besides fogs, we have also mist or haze, usually accompanying east winds, especially in the spring months. In the counties to the westward of the metropolis, this is called London smoke; but as it is seen to the eastward as well as westward of the city, the appellation is improper. The most natural idea we can form of this hazy appearance is, its being caused by the constitutional coldness of the east wind, which, checking the ascent of vapour raised by the sun, carries it horizontally along the lowest stratum of the air; hence its visibility. A lurid gloom is also sometimes produced by clouds of snow, when the water floating in the air becomes frozen into spicula, and congregating into flakes, contrary currents of wind wheel them into irregular masses, which obstruct the light from the sky, so as to wrap every object immediately below in a deep yellow light. This latter circumstance almost always precedes, and is a certain sign of, a fall of snow.—*Magazine of Natural History.*

CULTURE OF RICE IN CHINA.

The Chinese conduct this cultivation with great care, endeavouring in this, as in all the offices of husbandry in which they engage, to draw from the soil the greatest possible produce. The care of the cultivator begins before the seeds are placed in the earth. The grains destined for that purpose are put in baskets, and immersed in water, in which situation they remain for some days; this softens them, and tends to hasten their germination. The land which is to be sown with this crop is previously saturated with water, until the surface is like soft mud. In this state it is stirred up with a plough of very simple construction, to which is yoked a single buffalo. A rude kind of hurdle, drawn also by one buffalo, succeeds the plough, the driver sitting upon the hurdle to increase its weight, by which means the clods are broken down, and the ground made smooth. All stones are carefully removed; and as far as possible, every weed is extirpated. Water is then again let in upon the land, in just sufficient quantity to cover its surface, and a harrow, with several rows of great iron teeth, still further smooths and completes the preparation of the ground. Only those grains which have sprouted in the water are selected for sowing, since, as they have begun to germinate, their goodness is ascertained; all the rest are rejected. The seed is sown thickly and evenly on only

part of the ground; this serving as a nursery for the rest. A day after the seeds have been sown, the points of the plants appear above the surface of the ground. As soon as the plants have acquired a little strength, they are sprinkled with lime-water, for the purpose of destroying insects, which might otherwise prey upon the young shoots. This operation is performed with a small basket, attached to a long handle, the basket being filled by immersion from another vessel; it is moved over the plants, and the fluid runs through, and is thus equally distributed over them. When the young plants appear in thick vegetation, they are thinned; the superfluous plants being carefully taken up with their rootlets, and transplanted in a quincunx order in the unoccupied portion of the land which has been prepared for their reception. No delay must take place in this work, so that the plants may be as short time as possible out of the ground; a calm day is usually selected for the purpose. As soon as planting is completed, the water is admitted to overflow the plants. For the advantage of irrigation, the rice fields are usually situated near to a rivulet, pond, or other water, from which they are separated only by a bank, and through this a communication is readily made. Sometimes, however, it happens that the water is below the level of the fields; in this dilemma, the moisture so essential to the success of the crop is supplied by means of buckets, which is a most tedious and laborious operation. The grounds are kept perfectly clean from weeds, which are taken up by the root with the hand, although the soil is in such a swampy state that the labourers employed in this task cannot step upon the ground without sinking knees deep. The maturity of the grain is known by its turning yellow in the same manner as wheat; it is then cut with a sickle, tied in sheaves, and conveyed into sheds or barns, where it is thrashed with flails very similar to those used in England.—*Porter, in the Oriental Agriculturist.*

AN ACCOMPLISHED YOUNG LADY.

Her education is slicked off complete; a mantymaker gets her up well, and she is sent back to home with the Tower stamp on her, 'educated at a boardin'-school.' She astonishes the natives round about where the old folks live, and makes 'em stare agin, she is so improved. She plays beautiful on the piano two pieces; they were crack pieces, larned onder the eye and ear of the master; but there is a secret nobody knows but her—she can't play nothin' else. She sings two or three songs, the last lessons larn't to school, and the last she ever will larn. She has two or three beautiful drawin's; but there is a secret here too—the master finished 'em; and she can't do another. She speaks French beautiful; but it's fortunate she ain't in France now, so that secret is safe. She is a very agreeable gal, and talks very pleasantly, for she has seen the world. She was to London for a few weeks; saw the last play, and knows a great deal about the theatre. She has been to the opera on't, and has seen Celeste and Fanny Essler, and heard Lablache and Grisi, and is a judge of dancin' and singin'. She saw the queen a horseback in the Park, and is a judge of ridin'; and was at a party at Lady Syllabub's, and knows London life. This varnish lasts a whole year. The two new pieces wear out, and the songs get old, and the drawin's everybody has seed, and the London millinery wants renewin', and the queen has another princess, and there is another singer at the opera, and all is gone but the credit, 'she was educated at a boardin'-school.'—*Sam Slick in England.*

THE STURGEON FISHERY.

The river Volga, especially near its mouth, is the principal scene of this fishery. When the fish enter the river, which they do, like many others, at stated seasons, for the purpose of depositing their spawn, large enclosures of strong stakes are set across the current, to intercept and prevent their return; the enclosures narrow up the river, and the animal getting into these confined places, is easily speared. This fish (*Acipenser sturio*), of which there are several species, breeds in the Caspian in such numbers, as to fill the rivers flowing into that sea. Fifteen thousand sturgeons are sometimes taken in one day with the hook, at the station of Sallian on the Persian coast; and upwards of 700,000 were taken in the year 1829 in the Russian dominions off the coast of the Caspian. The flesh of the sturgeon is salted and dried for consumption during the numerous fasts enjoined by the Greek church; but the two most valuable products are *isenglass* and *caviare*. The

former is prepared from the air-bladder, and large quantities of it are annually imported into England from St Petersburg. Caviare is a preparation from the roe, of a strong, oily, but agreeable flavour; and is increasing in estimation here, if we may judge by the increased importation of it: a great deal is also consumed in Italy.

THE ROSE AND THE LILY.

[FROM THE GERMAN OF DEUERN.]

A LOVELY Rose and Lily growing
In a garden, side by side,
The Rose, with love's own radiance glowing,
Turned and said, in beauty's pride:
'Wherefore raise thy head so high,
Since not half so fair as I?

Sure all the magic charms that hover
O'er the lips of maiden fair,
In my bosom's depths the lover,
Fondly seeking, findeth there:
On her dewy lips repose
All the glories of the Rose!

The Lily turned to speak, soft smiling
With a proud yet gentle grace,
For well she knew the charm beguiling
Of her pure and virgin face:
'The whiteness of the maiden's breast,
Of beauty is the surest test.'

That moment, through the garden bounding,
Comes the treasure of my life;
As light they hear her footfall sounding,
Ceased each angry word of strife.
The lovely flowers she stands before,
And they are sisters evermore!

Her fair young cheek, where lilies, roses,
In fast friendship ever bloom,
To the rival flowers disclose,
In beauty's garden both have room:
Each declares, from envy free,
None so beautiful as she!

ARSENIC.

M. Grimaud, a chemist of Poitiers, proposes the following mode of rendering poisoning by arsenic more difficult. He recommends that this article shall be sold only when mixed with a certain quantity of sulphate of iron and cyanure of potash. About one per cent. of each substance would, he alleges, be sufficient. The arsenic, thus qualified, shows itself either by colour or smell, when used in the various aliments fit for man. Thus, arsenic prepared this way, and thrown into warm meat soup, gives immediately a green bronze colour; into hot milk, an opal; into red wine, a violet; into bread, a deep blue; and so on for twenty mixtures on which M. Grimaud has made experiments.

PREPARATION OF COFFEE.

It is a fact well known in Prague, that the water of the wells in that town is better adapted for use in making coffee than the river water; comparative analyses of the water indicate that this depends on the carbonate of soda contained in the former. Pleischl found this opinion corroborated by the fact, that a small quantity of the salt added to coffee improves its flavour, and advises consequently the addition of 43 grains of the pure carbonate to each pound of roasted coffee, as an improvement to the flavour, and also to the curative effect of this beverage, as it neutralises the acid contained in the infusion.—*Pharmaceutical Journal.*

THE WILL AND THE WAY.

THE old saying, that where there is a will there is a way, might be called an extreme proposition; yet it is so often found true, that proverbial wisdom is amply justified in adopting it. The roads which we incline not to travel are all sadly beset with specimens of the feline tribe; and when a gentleman is asked for money by a companion often in need of it, he is extremely apt to have a large and exhausting payment to make at the end of the week. But when he is really determined to push his way along the road, opposing lions have usually little terror for him, and, if anxious to oblige his friend, he will almost certainly be able to do so without the breach of any of his own engagements. So, also, I observe that my son Tom is very liable at ordinary times to a prejudice as to his power of mastering the lessons set to him by his master; but I seldom hear of any difficulty when a half holiday is made to depend on his being fully accomplished in them. In fact, the most wonderful feats are sometimes performed under the influence of a powerful impulse operating upon the will. When the Texan prisoners of the Santa Fé expedition were told, for instance, by their brutal conductor, that any who should prove unable to walk would be shot, many who had up to that moment seemed at the last gasp of exhaustion, plucked up and set off at a stout pace, which they kept up all day. Quentin Matsys thought he could not paint, till his master told him his daughter's hand depended on his producing a picture of merit within six months; and then he painted the well-known 'Misers,' now preserved in Windsor Castle.

Even in scientific matters this proverb is found applicable. An ingenious man, whose mind runs before its age, discovers some unexpected principles, and repeats the experiments by which they were ascertained over and over again to his entire satisfaction. Being inconsistent with some of the many preconceptions which ignorance or slight knowledge has fixed in the public mind, they are received with distrust, and the usual anxiety is shown by all the associates of the discoverer to find him out to be a base impostor, or at the best a pitiable dreamer. Some therefore go over the experiments, or think they do so, and, as they anticipated, can find no such results. And they really do not find the results. It is the common case. And all the world sits quietly down, saying, 'Oh, of course it was a mere delusion.' And then, if the discoverer is a modest timid man, there is an end of the matter perhaps for twenty years, when at length the principle is discovered again, and forced into notice by other persons. Now, what is the explanation of this? Simply, that the second experimenters came to the trial with sceptical distrustful minds, much more willing to see the

hypothesis disproved than to find it true. All such experiments require to have a number of minutiae, which are almost inexpressible in writing, carefully attended to; for example, the strength or freshness of a particular ingredient may be of material consequence. Thus, although the experiment may have been to appearance fully and fairly made, some little points, *such as a person otherwise disposed would have been sure to attend to*, are neglected; and for this reason the results are a failure. Such circumstances are continually taking place in the scientific world. The failure is often the result of no feeling so decided as ill-will, but merely of indifference or carelessness. Microscopic accuracies necessary for the success of the experiment will only be fully attended to by the person who feels a heart interest in that success, and is disposed to take any trouble or make any sacrifice to attain it. Besides the actual discoverer, there is no such person, or, if there be, it is a rare case.

The kind of men called great are usually remarkable for powerful will. Cæsar, Cromwell, Frederick, Napoleon, Wellington—see in them all this efficacious principle towering over almost every other, and rendering opposing circumstances as nothing in their path. They resolve, and the thing is done. The secret of this success is here. Such men first affect their lieutenants, and others immediately around them. These persons, finding all hesitation unacceptable, and no difficulties acknowledged, are inspired to make great efforts. They again affect the mass, and thus the spirit of one man impresses and energises all. The word impossible becomes a lost term in such hosts. Great talents of any kind without this one central principle would not serve. What is required to animate and conquer is WILL; a principle only connected with intellect, but not intellect itself—far from it; a thing essentially selfish, yet a needful aid in the whole procedure of our nature. Men remarkably endowed with will are not always either just, or kind, or judicious. Often, finding it serve them well in some instances, and hearing men whisper flattering remarks upon it, they begin to make it an object of worship. They do not will that they may do; but they act because they take a pleasure in Willing. Obstinate, harsh, pestilent they often are to their fellow-creatures; not unfrequently great martyrs to their own dogged irrational determinations. Yet there is a sublimity in powerful will, which compels all men to venerate. It is the *sine-qua-non* of all mastery and command. He who lacks it may be amiable, ingenious, upright, wise beyond the wisest, but never will fix decided esteem in the multitude, or come to anything great.

It is extremely puzzling to say how far the common notion, that men might in general act better if they would, is true. We see one man act well, and it is

natural to think that another might do the same, if he chose, particularly as we often see an impulse or motive applied to a man which induces him to exert himself as he never did before. But the perplexing point is, where are we to get, in all cases, the adequate external impulse? The will is a natural endowment as well as the moral faculties themselves. Young persons, and many who continue to be always of mediocre character, have generally little of it. The want of it is often the first, and continues to be the leading feature of insanity. When we see a man acting in a certain way from no want of judgment or good intention, but defect of will to do rightly, can we say that the case is different, either essentially or in its relations, from a case in which there was neither judgment nor good intention? As bad to want will as to want anything. Indeed, most persons who have had occasion to endeavour to operate upon the moral nature of their fellow-creatures, will be prepared to acknowledge that there was no class of cases so apt to appear to them utterly hopeless as those in which there was, while other features of an estimable kind were present, an utter want of will. The passive resistance presented by such natures is felt as a more deadly obstacle than the most perverse actual tendencies. Yet here we should remember our own maxim, where there is a will there is a way, and not be too ready to abandon those who are little ready to reflect upon us the lustre of success. After the many instances which we know of a thorough change of human conduct under the application of right and fitting means, it would surely be unjust to conclude that there is any fellow-creature beyond being set up in moral beauty, if we only could bring the right agency to bear upon the part of his mind which is fitted to yield to it.

It is in regarding it as a star of hope to all under difficulties and disasters, that the maxim is presented to us in its most interesting light. The youth who feels what a hard task he has before him ere he can say that he has attained his proper place in life, knows this golden sentence, and girds his loins up cheerily for that long probation which at once tests his virtue and wins his fortune. The unfortunate on whom the clouds of evil seem closing all round, and who fears that he must be overwhelmed by them, recalls the animating adage, and because he wills, *does* break through all. In short, hardly any difficulty could be cited to which this philosophy is not applicable; and every one will find, if he tries, that, be it through the brakes of entangling and bewildering passions, be it over the wide and unmarked moor of uncertainty, be it through the slough of despond itself, WHERE THERE IS A WILL THERE WILL BE A WAY.

MORNINGS WITH THOMAS CAMPBELL.

SECOND ARTICLE.

IN the course of our ramble we called on the poet's namesake, Mr Thomas Campbell the sculptor. In looking through the studio, I had occasion to notice the excessive admiration with which he regarded beauty of form and expression. A female bust absolutely entranced him. There was no tearing him away from it. The fascination was as complete as in the instance of the 'Child Sweetheart.' This did not seem to be equally the case with pictures. We were afterwards in the National Gallery, and I did not notice any peculiar susceptibility to the beauties of the few very fine pictures in the collection. The charm of the rounded contour, and the effect of the lucid marble, in works of sculpture, no doubt formed part of the spell. In his Life of Mrs Siddons, Campbell has recorded his impressions on first seeing the Apollo Belvidere in the Louvre; and as the passage is one of the few really worthy of him in that memoir, and illustrates the peculiarity alluded to, I shall extract it:—

'From the farthest end of the spacious room, the god seemed to look down like a president on the chosen assembly of sculptured forms; and his glowing marble,

unstained by time, appeared to my imagination as if he had stepped freshly from the sun. I had seen casts of the glorious statue with scarcely any admiration; and I must undoubtedly impute that circumstance in part to my inexperience in art, and to my taste having till then lain torpid. But still I prize the recollected impressions of that day too dearly to call them fanciful. They seemed to give my mind a new sense of the harmony of art—a new visual power of enjoying beauty. Nor is it mere fancy that makes the difference between the Apollo himself and his plaster casts. The dead whiteness of the stucco copies is glaringly monotonous, whilst the diaphanous surface of the original seems to soften the light which it reflects. Every particular feeling of that hour is written indelibly on my memory. I remember entering the Louvre with a latent suspicion on my mind that a good deal of the rapture expressed at the sight of superlative sculptures was exaggerated or affected; but as we passed through the passage of the hall, there was a Greek figure, I think that of Pericles, with a chlamys and helmet, which John Kemble desired me to notice; and it instantly struck me with wonder at the gentlemanlike grace which art could give to a human form with so simple a vesture. It was not, however, until we reached the grand saloon that the first sight of the god overawed my incredulity. Every step of approach to his presence added to my sensations, and all recollections of his name in classic poetry swarmed on my mind as spontaneously as the associations that are conjured up by the sweetest music.'

We next went to the British Museum. I had previously seen the Elgin marbles and other works of art, and Mr Campbell proposed that we should just glance at the library. He sent in his card to Sir Henry Ellis, who came and conducted us through the rooms. The poet was warm in his admiration of the large room. Sir Henry said there were about 300,000 volumes in the library. The Louvre contains 700,000 or 800,000; but single pamphlets or thin volumes are counted separately; not bound together, several in a volume, as in our national institution. The Cambridge University library consists of about 150,000 volumes—the Bodleian, I should suppose, considerably more; and the rate of increase is about 5000 a-year. It is scarcely possible for a bookish man, new from the solitude of the country, to survey these princely collections without echoing the sentiment of James I. —'If it were so that I must be a prisoner, I would have no other prison than such a library, and be chained together with all these goodly authors.'

From the museum we proceeded to the house of Mr Rogers in St James's Place. The venerable author of 'The Pleasures of Memory' gave his brother bard a courteous and kind reception. He seemed delighted to see him. 'Mr Rogers,' said the younger of the poets, 'I have taken the liberty to bring a friend from the country to see your house, as I was anxious he should not leave London without this gratification.' Mr Rogers shook me cordially by the hand, and said every friend of Mr Campbell's was welcome. 'But, Campbell,' added he, 'I must teach you to speak English properly.' [Here the sensitive poet stared and reined up a little.] 'You must not abuse that excellent word *liberty*, as you have done on this occasion.' We now looked over the pictures and works of art—a marvellous collection for so small a depository! Mrs Jameson, Miss Sedgwick, and others, have described the classic mansion in St James's Place. The hospitality of Rogers is proverbial—his breakfasts are famous. Indeed the poet has the credit of establishing the breakfast-party as a link in London society. He 'refined it first, and showed its use.' Mornings in St James's Place are scarcely inferior to the 'delicious lobster nights' of Pope. With the poet of memory, manners the most bland and courteous are, even to strangers, united to the fullest and freest communication of thought and opinion. His delicacy of feeling and expression, and his refined taste, are indeed remarkable; but, in place of rendering him miserable, as

Byron has surmised, I should say they contributed to his happiness and enjoyment. His life has been long and prosperous, and his relish of it seems unabated: he has had a 'latter spring,' lusty and vigorous.

No person perhaps possesses so many literary relics and curiosities as Mr Rogers. The beautiful manuscripts of Gray, written with a crow-quill pen, are among his treasures. In his library—framed and glazed—is the celebrated agreement between Milton and his publisher for the copyright of *Paradise Lost*. The great poet's signature, though he was then old and blind, 'fallen upon evil days,' is singularly neat and distinct. He has also a bust of Pope, the clay model by Roubiliac. 'My father,' said Mr Rogers, 'stood by the side of Pope when Roubiliac was modelling that part of the drapery.' A bust of Pope, enriched by such associations, is indeed valuable. The features are larger than the common prints represent. I had seen an original painting of him, taken when he was ten or twelve years younger, by Jervas, but it is greatly inferior in expression. Here we had Pope calm, thoughtful, penetrating, somewhat wasted by age, disease, and study, but still the clear fine thinker and man of genius. Mr Rogers showed us also an original sketch by Raphael, for which, if we recollect right, he said the Marquis of Westminster had offered him as much land as would serve for a villa! Autograph letters, 'rich and rare,' abound in Mr Rogers's repositories, with scarce books almost as valuable. On one of the tables lay a large piece of amber enclosing a fly, entire in 'joint and limb.' Mr Campbell mentioned that Sidney Smith, who has always some original or humorous remark to make on every object, taking up this piece of amber one day, said, 'Perhaps that fly buzzed in Adam's ear.' After a couple of hours delightfully spent among the books and pictures, Mr Rogers invited us to breakfast next morning. When we got to the door, Campbell broke out—'Well, now, there is a happy and enviable poet! He is about eighty, yet he is in the full enjoyment of life and all its best pleasures. He has several thousands per annum, and I am sure he gives away fifteen hundred in charity.'

Next morning Mr Campbell called at the Tavistock hotel, where he had kindly agreed to meet me, that we might go together to St James's Place. On the way, I mentioned that I had been reading Leigh Hunt's book about Lord Byron, which I had purchased at a stall. 'There is a great deal of truth in it,' said he; 'but it is a pity Hunt wrote it.' He thought Byron would have been a better man if he had continued to live in England: 'the open light of English society and English manners would have kept him more generally right.' We found at Mr Rogers's two other guests—Major Burns, second son of the poet, and the Honourable Charles Murray. Neither of these gentlemen had seen Campbell before, and they appeared highly gratified at the meeting. In the conversation that passed, I shall of course only glance at literary or public topics, not casual or hasty remarks. Captain Murray informed the poet of the present state of Wyoming in Pennsylvania, which has lost, if it ever possessed, that romantic seclusion and primitive manners drawn so beautifully by Campbell: it is now the scene of extensive iron and coal works. The conversation then turned on Captain Murray's adventures among the American Indians. He was several months without seeing a white man. He said he fully believed the stories told in narratives of shipwrecks, of men becoming wolfish and unnatural from excessive hunger. He was at one time nearly two days without food, though undergoing severe exercise on horseback. At the close of the second day he got a piece of raw buffalo flesh, which he devoured greedily; and had it been a piece of human flesh, he was almost convinced he could not have refrained from eating it. Major Burns instanced Byron's vivid description of the shipwreck in *Don Juan*, which was founded on fact. 'Yes,' said Campbell, 'Byron read carefully for materials for his poems.' The manner in which Byron introduces the cannibalism of the famished seamen—their

first dark hints on the subject of murdering one of their number for food—is certainly a very powerful piece of painting. As the cant phrase is—it is like a sketch by Rembrandt.

The presence of Major Burns naturally led to remarks on his father's genius. Campbell got quite animated. He said Burns was the Shakspeare of Scotland—a lesser diamond, but still a genuine one. Tam O'Shanter was his masterpiece, and he (Campbell) could still repeat it all by heart. It reminded him of a certain class of sculpture—the second or Alexandrian class—in which the figures were cast, not hewn or worked out by patient labour. Tam O'Shanter appeared to have been produced in a similar manner, cast out of the poet's glowing fancy, perfect at once. The actual circumstances attending the composition of Tam O'Shanter are not unlike this, as may be seen from the interesting account given by Mr Lockhart. As Johnson loved to *gird* at David Garrick, but would allow no one else to censure him, Campbell liked occasionally to have a hit at his countrymen, on the score of their alleged Pharisaical moderation and prudence. Burns, he maintained, had none of the *puawkiness* characteristic of his country—he was the most unScotsmanlike Scotsman that ever existed. Some of us demurred to this sally, and attempted to show that Burns had the national character strongly impressed upon him, and that this was one of the main sources of his strength. His nationality was a font of inspiration. Mr Rogers said nothing. Campbell then went on to censure the Scotch for their worship of the great. Even Scott was not exempt from the failing. 'I was once,' said he, 'in company with Walter Scott, where there were many of us, all exceedingly merry. He was delightful—we were charmed with him; when suddenly a lord was announced. The lord was so obscure, that I had never heard of him, and cannot recollect his name. In a moment Scott's whole manner and bearing were changed. He was no longer the easy, delightful, independent good fellow, but the timid, distant, respectful worshipper of the great man. I was astonished: and, after all, you might have made a score of dukes and lords out of Walter Scott, and scarcely missed what was taken away.' Mr Rogers said, if he had a son who wished to have a confidential friend, he would recommend him to choose a Scotsman. He would do so in the spirit of the old maxim, that a man will be found the best friend to another who is the best friend to himself. A Scotsman will always look to himself as well as to his friend, and will do nothing to disgrace either. Thus, in his friend, my son would have a good example as well as a safe adviser.

Mr Campbell said he had, when a young man, an interview with Charles James Fox, which gave him a very high idea of him as a man. It was too bad, he added, in Sir Walter Scott, even in those bad times, to write of Fox as he did in his political song on Lord Melville's acquittal, Fox being at the time on his death-bed. Mr Rogers explained that Sir Walter had in that room expressed his deep regret at the circumstance: he said he would sooner have cut off his hand than written the lines if he had known the state in which Fox then was. 'This,' added Rogers, 'Scott told me with tears in his eyes.' I mentioned having seen some unpublished letters of Sir Walter, addressed to Lady Hood (now Mrs Stewart Mackenzie of Seaforth), in which he also expressed regret on account of his unlucky political song, for which he had been blamed by Lady Hood and the then Marchioness of Stafford.

The poets talked of Shakspeare. Rogers said playfully that Shakspeare's defects of style and expression were so incorporated with his beauties, and we were so blinded by admiration, that we did not discover them. He instanced the construction of the fine passage—

'And the poor beetle that we tread upon,
In corporal sufferance finds a pang as great
As when a giant dies.'

'The beetle feels nothing when a giant dies, but of course the poet meant that it felt at its own death a

pang as great as a giant feels when he dies. Naturalists will not concede this; but I speak only of the construction of the lines; such slovenly and elliptical expression would not be tolerated in an inferior poet.' 'We are all taught from youth to idolise Shakspeare,' said Campbell. 'Yes,' rejoined Rogers, 'we are brought up in the worship of Shakspeare, as some foreigner remarked.' The sonnets of Shakspeare were then adverted to, Mr Rogers expressing a doubt of their genuineness, from their inferiority to the dramas. The quaint expression, and elaborate, exaggerated style of these remarkable productions would not, however, appear so singular in the time of Elizabeth. Poets are generally more formal and stiff in youth than in riper years, and in the plays of Shakspeare we see the gradual formation of his taste and his acquisition of power. It is worthy of remark, however, as Mr Campbell mentioned, that the *Venus and Adonis* (a truly fine Shakspearian poem) was written before the sonnets, as the poet, in his dedication to Lord Southampton, calls it 'the first heir of his invention.'

I took occasion to ask Campbell if it was true that Sir Walter Scott had got the whole of the *Pleasures of Hope* by heart after a few readings of the manuscript one evening. 'No,' said he; 'I had not met Scott when the *Pleasures of Hope* was in manuscript; but he got Lochiel's Warning by heart after reading it once, and hearing it read another time: it was a wonderful instance of memory.' He corrected me for pronouncing 'Lochiel' as a dissyllable. 'It is Loch-ee-il,' said he; 'such is the pronunciation of the country; and the verse requires it.' Rogers laughed heartily at the anecdote told by Moore, that Scott had never seen *Melrose* by moonlight, notwithstanding his poetical injunction—

'If thou would'st view Melrose aright,
Go visit it by the pale moonlight,' &c.

'He had seen other ruins by moonlight, and knew the picturesque effect, or he could very easily imagine it.' Major Burns said that Scott admitted the same to him on the only occasion he had ever met the great minstrel; and Jonny Bower, the sexton, confirmed the statement, adding, 'He never got the key from me at night, and if he had got in, he must have *speeled the wa's*.' Campbell was greatly amused at this.

Some observations were made on the English style of Scotch authors. It was acknowledged by both the poets that Beattie wrote the purest and most idiomatic English of any Scotch author, not even excepting those who had been long resident in England. The exquisite style of Hume was warmly praised. 'He was substantially honest too,' said Campbell. 'He was, from principle and constitution, a Tory historian, but he makes large and liberal admissions on the other side. When I find him conceding to his opponents, I feel a certainty in the main truth of his narrative. Now, Malcolm Laing is always carping at his opponents, and appears often in the light of a special pleader.' 'Hume has one sentence in his history,' said Mr Rogers, 'which all authors should consider an excellent specimen of his style;' and the venerable poet, with great alacrity, went up to the library, and brought down a volume of Hume. He opened it at the account of the reign of James I., and read aloud with a smile of satisfaction—'Such a superiority do the pursuits of literature possess above every other occupation, that even he who attains but a mediocrity in them, merits the pre-eminence above those that excel the most in the common and vulgar professions.' 'Dr Chalmers,' continued Mr Rogers, 'went farther than this. In one of his sermons here, which all the world went to hear, he remarked, when speaking of the Christian character, that it was above that of the warrior, the statesman, the philosopher, and even the poet—thus placing you, Campbell, above the Duke of Wellington.' 'Very good,' said Campbell laughing, 'I would place his father (looking to Major Burns) above any of them.' It was impos-

sible not to think of Campbell's own lines in his *Ode to the Memory of Burns* :—

'O deem not 'midst this worldly strife
An idle art the poet brings;
Let high philosophy control,
And sages calm the stream of life,
'Tis he refines its fountain-springs,
The nobler passions of the soul.'

The only instance of Mr Rogers's severity which I noticed in the course of the forenoon, was a remark concerning a literary foreigner who had been on a visit to London, and left an unfavourable impression on his English admirers. 'He made himself one evening,' said he, 'so disagreeable, that I had a mind to be very severe. I intended to have inquired in the tenderest tone how his wife was?' The gentleman alluded to and his wife had, it appears, separated a few days after their marriage from incompatibility of temper. The conversation now turned to the subject of marriage. Mr Rogers said he thought men had judged too harshly of Swift for his conduct towards Stella and Vanessa. Swift might have the strongest affection for both, yet hesitate to enter upon marriage with either. Marriage is an awful step (a genuine old bachelor conclusion!), and Johnson said truly, that to enter upon it required great moral courage. 'Upon my word,' said Campbell, 'in nine cases out of ten it looks like madness.' This led to some raillery and laughter, and we shortly afterwards took our leave. Captain Murray had been compelled to leave early, and we were thus deprived of his lively and varied conversation. Four hours had sped away to my infinite delight. The poets parted with many affectionate words and congratulations, promising 'oft to meet again.' I walked with Mr Campbell to the Clarence Club, and on quitting him there, he said, 'Be sure to go to Dulwich in the afternoon and see the pictures: you can easily get there, and in the evening roll back to London in that chariot of fire, the railway train.'

I did so, and also attempted to Boswellise our morning's talk—my first and only attempt of the kind. Let any one make a similar effort to recall and write down a four hours' conversation, and he will rise with a higher idea of Boswell than he ever previously entertained!

I had afterwards frequent opportunities of meeting the poet. He was seen to most advantage in the mornings, when a walk out of doors, in the sunshine, seldom failed to put him in spirits. He had a strong wish to 'make a book' on Greek literature, taking his lectures in the New Monthly Magazine for his groundwork. Sometimes I found him poring over Clarke's Homer, or a copy of Euripides, on which occasions he would lay down the volume, take off his spectacles, and say, with pride, 'I was at this by seven o'clock in the morning.' Early rising was a favourite theme with him, though latterly he was, like Thomson, more eager to inculcate than to adopt the practice. 'Gertrude of Wyoming' was a daylight production, written during his residence at Sydenham, near London—his first home after marriage, and the scene of his brightest and happiest days. Mr Campbell spoke with animation one morning of a breakfast he had just had at Mr Hallam's. 'It was the breakfast of the poets,' said he, 'for Moore, Rogers, Wordsworth, and Mr Milman were there. We had a delightful talk.' Campbell had very little regard for the 'Lake Poets,' as they were called, but he held Wordsworth to be greatly superior to the others. He admired Coleridge's criticism, but maintained that he got some of his best ideas from Schlegel. 'He was such an inveterate dreamer,' said he, 'that I daresay he did not know whether his ideas were original or borrowed.' Yet Campbell used to ridicule most of the charges brought against authors of direct plagiarism. One day the late John Mayne, the Scottish poet, accused him of appropriating a line from an old ballad—

'Adown the glen rode armed men.'

'Pooh,' said he, 'the old ballad-writer had it first—that

was all.' Two well-known images in the Pleasures of Hope are taken, it will be recollected, one from Blair's Grave, and the other from Sterne. A poet, in the hour of composition, waiting for the *right word*, or the closing image, he once compared to a gardener or florist waiting for the summer shower that was to put all his flower-beds into life and beauty. In his own moments of inspiration, however, Campbell was no such calm expectant. He used to be much excited—walking about—and even throwing himself down. In the island of Mull, where he first felt the force of his rapidly-awakening powers, his friends, at such times, used to think him crazed. But to return to our memoranda. Moore, according to Campbell, had the most sparkling and brilliant fancy of any modern poet. 'He is a most wonderful creature—a fire-fly from heaven—yet, as Lady Holland said, what a pity we cannot make him bigger!' Scott, he said, had wonderful art in extracting and treasuring up old legends and characteristic traits of character and manners. 'In his poems there is a great deal about the Highlands, yet he made only passing visits to the country. After his Lord of the Isles came out, a friend said to me, "Where can Walter Scott have got all those stories about the West Highlands? I was six weeks there, making inquiries, yet heard nothing of them." "It is his peculiar talent—his genius," I replied; for I was nearly six years there, and knew nothing of them either. Crabbe was a pear of a different tree. What work he would have made among the Highland bothies! His *musa severior* would have shown them up. No romance—no legends—but appalling scenes of sordid misery and suffering. Crabbe was an amazingly shrewd man, yet mild and quiet in his manners. One day at Holland-house they were all lauding his simplicity—how gentle he is! how simple! I was tempted to exclaim, "Yes, simplicity that could buy and sell the whole of you!"'

The early struggles and ill-requited literary drudgery which Campbell had to submit to for years, gave a tinge of severity to some of his opinions and judgments both of men and things. These splenetic ebullitions, however, never interfered with his practical charity and kindness. He loved to do good, and he held fast by old friends and old opinions. Like Burns, he worshipped 'firm resolve.'

That stalk of carl-hemp in man.

Among the literary opinions of Mr Campbell, was one which he was fond of maintaining—the superiority of Smollett as a novelist, compared with Fielding. This is mentioned in the *Life of Crabbe*; and I asked in what points he considered the superiority to consist? 'In the vigour and rapidity of his narrative,' he said, 'no less than in the humour of his incidents and characters. He had more imagination and pathos. Fielding has no scene like that in the robber's hut in Count Fathom: he had no poetry, and little tenderness in his nature.' Yet the real life and knowledge of human nature evinced by Fielding, his wit, and the unrivalled construction of his plots, seem to place him above his great associate in English fiction. Neither was remarkable for delicacy; but Smollett was incomparably the coarser of the two. Certainly, like good wines, Fielding improves with age, and the racy flavour of his scenes and characters has a mellow ripeness that never cloy on the taste. Mr Campbell, as already hinted, had a roving adventurous fancy, that loved a quick succession of scenes and changes, and this predilection might have swayed him in favour of Smollett. *Some things* Smollett may have done better than Fielding, but not *entire novels*.

After an interval of two years, I again met Mr Campbell in London. He was then much changed—feeble and delicate in health, but at times rallying wonderfully. I have a very vivid recollection of a pleasant day spent with him at Dr Beattie's cottage at Hampstead. We walked over the heath, moralising on the great city looming in the distance, begirt with villas—

Like a swarth Indian with his belt of beads.

At Beattie's he was quite at home. The kind physician knew him well, and had great influence over him. Mr Campbell at this time resided at Pimlico. A young Scottish niece acted as his housekeeper, and to this lady he left the whole of his little property.

His letters from Boulogne were few and short, mostly complaining of the cold weather. In a note dated 17th November 1843, we find him remarking—'The climate here is naturally severer than in England. Joy to you in Scotland, whom Jove treats more mildly! I suppose the cold of the north has been ordered to march all to the south, and that it is to be long billeted upon us!' One cause of the poet's residence in Boulogne was the promotion of his niece's education. Mr Hamilton, the English consul, was, as usual, kind and attentive; but though Campbell now and then looked in upon a ball-room or festive party, he seldom stayed longer than an hour. Dr Beattie generously went to succour him in his last illness, and the poet had the Church of England service for the sick read to him by the Protestant clergyman of Boulogne. He died calmly and resignedly—his energies completely exhausted. He used to say he was of a long-lived race. Sixty-seven, however, is no very prolonged span of life; yet his two favourite poets, whom he resembled in genius, died much earlier. Gray, at the period of his death, was fifty-five, and Goldsmith only forty-five. Campbell's magnificent funeral in Westminster Abbey is matter of history. *Requiescat in pace!*

THE FESTIVAL AND ITS CONSEQUENCES.

A SCENE IN NAVARRE.

It was a fine afternoon in the spring of 1834; the birds were cheerfully singing on the trees, the flocks and herds contentedly cropped the young herbage, and the air was perfumed with odours. Not only did the face of nature brightly smile, but some festive ceremony was evidently about to be performed in the village of —, in Navarre. Numbers of young girls were seated at the cottage doors, weaving garlands of spring flowers, whilst several youths looked on and encouraged them. Here and there an old man, wrapped in a rusty-brown cloak almost as ancient as himself, stood observing the juvenile groups; and on the threshold of a miserable hovel sat an aged woman singing a wild air, accompanied by uncouth gestures; but whether they betokened joy, grief, or anger, it would have been difficult for a stranger to determine.

At length the damsels rose, each bearing in her hand the blooming wreath she had entwined, and the whole party proceeded to a small *plaza*, or square, in front of the church, where, waving their chaplets gracefully, they danced to the sound of a large tambourine and the mountain-pipe, called the *gaeta*, the tones of which strongly resemble those of the bagpipes. Nor was the human voice wanting: the harsh and discordant chant of the beldame was again heard; and by her side a lean rickety boy, of about fourteen, with wiry flaxen hair, imbecile look, and unmeaning grin, beat time by clapping his hands. The dancers became more and more animated every moment; the fine hair of the young women, which had hitherto been plaited and arranged with natural good taste, was, by some sudden process, allowed to fall loosely on their shoulders; and at the same moment each maiden placed a chaplet on her head, the young men slinging larger garlands across their breasts, like the broad ribbons of chivalric orders.

At the conclusion of the dance, the great gates of the church were thrown open; at the eastern end the altar, resplendent from the effect of numerous large wax candles, had an imposing appearance. The cura, or priest, habited in richly-embroidered vestments, stood under the portico, and spreading forth his hands, bestowed a blessing on the people, who knelt reverentially to receive it.

While this act of devotion was in progress, a loud

creaking sound was heard, and presently a small body of men appeared advancing along the road which runs close by the square. Their heads were covered with the flat cap called *La Boina*; they wore coarse brown cloth jackets, and loose white linen trousers, their waists being encircled with broad red woollen sashes, below which, and in front, were strapped their cananas, or cartridge-pouches: instead of shoes they had *alpargatas*, or hempen sandals: they were armed with muskets, and bayonets without scabbards were stuck in their belts. This vanguard was followed by four wains, each drawn by two oxen, guided by a peasant bearing a long staff, with a goad at one end. The oxen moved very slowly, the creaking sound being produced by the evolutions of the heavy wooden axletrees of the wains, which were followed by a much larger party, clothed and armed in the same manner as that in advance, the whole being commanded by an officer in uniform. Three of the bullock-cars contained each a new bronze mortar of moderate size; the fourth was laden with ammunition-boxes. On their arrival in the plaza, the escort uncovered their heads, knelt, and received the priest's benediction. The assemblage then rose; the tambourine and mountain-pipe struck up; the old woman resumed her discordant song; the half-witted urchin clapped his lean hands more vehemently than ever; the young men and maidens moved towards the wains with a solemn dancing step; and, finally, the girls decorated the horns and necks of the oxen with the wreaths they had been gracefully waving during the dance; whilst the youths encircled the mortars with the larger garlands; the whole ceremony being performed with the utmost enthusiasm.

Meanwhile, the priest had retired to the interior of the church; but when all the arrangements were completed—the oxen adorned with their glowing honours, standing patiently in the sun, and the murderous bronze artillery decked with sweet and peaceful flowers—he again came forth, preceded by a youthful acolyte carrying a large silver cross, elevated on a staff apparently of the same metal. By his side was another boy wearing a scarlet cassock, over which was a white muslin tunic: he bore a silver censer, which, when this little procession had reached the wains, he threw up into the air, and then drew it back again by its silver chain, making the white smoke of the incense cloud over the mortars, and around the heads of the oxen, after which the priest sprinkled them with holy water. The instant this ceremony was completed, there was a general shouting of '*Viva Carlos Quinto! Viva la Religion! Success to the new mortars! Death to the Christinos!*' Amidst these fervent cheers the bullock-cars moved on, escorted as before; the young men accompanying them as a guard of honour a little way beyond the limits of the village. On parting, the soldiers cried—'*To Elizondo! to Elizondo!*' and soon entering a mountain gorge, they disappeared.

The day after this scene there was considerable agitation in the village. Several fathers of families, who had been absent acting as scouts attached to Don Carlos's army, or otherwise connected with it, returned. They brought accounts of the retreat of the Carlist chief, Zumalacarreguy, from before Elizondo; and it was whispered that the mortars which had passed through on the previous day, and had been welcomed with so much pomp, were on their way back. The confusion occasioned by these reports was at its height when a stranger, covered with dust, rushed into the plaza with breathless haste. He was a fine well-made man of about thirty; his features, though handsome, bore a strong stamp of cunning; and the expression of his large gray eyes, set in a face the colour of which was only a shade removed from black, was so peculiar, as to render it painful to meet their gaze. The stranger's costume was unlike that of the Navarrese peasants. He wore a jacket of dark-blue velvet, open, displaying a waistcoat of the same material, adorned with three rows of large open-worked silver buttons, hanging loosely; his breeches were

of coarse dark cloth, with silver buttons down the outer seams; he also wore a blue worsted sash, and hempen sandals. Round his head was a cotton handkerchief of bright and variegated colours, tied behind, with two long ends hanging down; above the handkerchief appeared a cone-shaped black beaver hat, with a narrow brim turned up all round; the front of the hat was ornamented with three tarnished tinsel stars—green, ruby, and yellow—stuck on a strip of rusty black velvet. His thick neck was bare, and, from constant exposure to the sun and weather, as dark as his face. He was a *gitano*, or gipsy.

'I am sent by Zumalacarreguy,' said this man, 'to tell you that the mortars are on their way back, and that they must be concealed in this neighbourhood; all, therefore, must unite in conveying them to a place of safety. The general's orders are, that every man proceed instantly to meet them: they must not re-enter the village: your privileges, your lives even, depend on promptitude and energy: the *holy* guns must be placed in security.'

This appeal met with a ready echo in the breast of every hearer; for the whole population of the village had identified themselves with the fate of the consecrated artillery. All the men immediately sallied forth with Zumalacarreguy's messenger. They had not proceeded far along the road, before the well-known creaking of the bullock-cars indicated that the objects they had set forth to meet were approaching: they soon appeared, bereft, however, of their gay adornments.

The gitano immediately addressed himself to the officer in command of the escort: and after a brief parley, three of the village elders were summoned to join in the consultation. Much animated discourse ensued, accompanied by that lively gesticulation by which the Spaniards are characterised. The result was, that the wains were drawn along a by-road to a field, under the guidance of the villagers, the gipsy and the escort following. On arriving at the centre of the field, the oxen were taken out of the wains, which, being tilted up, the mortars glided easily to the ground. The peasants had brought with them the large hoes used by the husbandmen of Navarre, and having dug trenches of about three feet deep, the mortars, which only the day before were adorned with garlands, and sent with shouts and vivas to be employed against the Christinos, were now buried in the earth in solemn silence.

The oxen were again yoked to the wains, and led to the high road, whence they departed in an opposite direction: the escort took the shortest route to the mountains, and the villagers hastened to regain their homes. The gipsy proceeded to the residence of the cura, with whom he was closeted for some time: he then went to the small venta, or village inn. After his departure, the alcalde was summoned to attend the cura: they held a long conference, at the conclusion whereof the alcalde visited every house, and made a communication of solemn import to its inmates.

Towards evening several little groups were assembled in the plaza, and before the house doors. They conversed energetically, and, on separating at nightfall, their countenances and manner indicated that a definitive and decided resolution had been universally adopted upon some highly interesting and important matter.

The following morning, just as the mists were clearing away from the summits of the neighbouring mountains, General Mina entered the village, having marched during the greater part of the night. He had previously caused the place to be surrounded by his troops, in order to prevent the escape of any of the inhabitants. Attended by his staff, he rode to the plaza, whither the whole population were summoned by the crazy drum and drawing voice of the *prégonero*, or public crier.

The people, who only two days before had hastened to the same spot with dancing step and exulting eye, cheered by the tambourine and mountain-pipe, now crept one by one out of their dwellings with fearfully-anxious looks, and wended their unwilling way towards the plaza.

Mina eyed them sharply as they emerged from the narrow avenues; but his weather-beaten face did not betray any inward emotion. By his side stood the cura, dressed in a rusty-black cassock, holding between both hands his oblong shovel-hat, and pressing its sides within the smallest possible compass. His countenance was ghastly, and his small jet-black eyes peered from beneath their half-closed lids, first at the villagers as they glided into the plaza, and then askance at the general, who had already questioned him closely with regard to the mortars, which he had been assured the villagers had voluntarily assisted in attempting to convey to Elizondo—then in possession of the queen's forces, and fortified—for the purpose of bombarding it. He had also heard of the ceremony of decorating and rejoicing over the mortars, and of their subsequent concealment, with the connivance and aid of the cura's parishioners.

The priest, however, pretended to be totally ignorant of the matter. 'Senor General,' he said, 'the cura of — will never sanction rebellion against his rightful sovereign.'

As soon as these words had escaped his lips, a loud clapping of hands was heard immediately behind him. Upon turning round, the cura perceived the idiot lad, who laughed in his face, and trailed his half-dislocated legs along, in grotesque imitation of dancing. The cura looked affrighted; the muscles of his visage became suddenly contracted; and his eyes flashed fire upon the urchin whose noisy movements seemed to strike terror into his soul.

The plaza was now crowded with men, women, and children; shortly afterwards an aid-de-camp appeared, followed by an officer's guard. The former approached the general, and reported that, in pursuance of his orders, every house had been searched, and that, to the best of his knowledge, all the male inhabitants who remained in the village were now present.

'Let them be separated from the women and children,' said the general.

This order was promptly executed, the men being drawn up in a line before Mina. It was a strange, an anxious scene: the elderly men stood, like ancient Romans, with their cloaks thrown about them in every variety of picturesque drapery; some of their younger companions were dressed in brown woollen jackets, their snow-white shirt collars falling on their shoulders; others in short blue smock-frocks, confined round the waist by broad girdles of bright mixed colours. All wore the picturesque boina, but of varied hues—blue, white, or red.

The women and children formed a gloomy back-ground to this singular picture: they were far more numerous than the men, one or more of every family having joined the Carlist party. The young girls, who only forty-eight hours before had been weaving chaplets with so much glee and energy, now stood motionless, some looking fixedly on Mina; others, their hands clasped, and their beautiful eyes raised towards heaven, appeared absorbed in prayer. The old woman, crouched on the ground, plied her knitting-needles with great diligence; her lips moved rapidly, but no sound escaped from them; and she had so placed herself as to be able to peer through the slight separation between two of the men who stood before her.

Mina now advanced a few paces in front of his staff-officers, and thus addressed the villagers:—

'I know that, two days ago, three mortars passed through your village on their way to Elizondo, and that, yesterday, they were brought back. I also know that they have been concealed in this vicinity with the knowledge of the inhabitants: where are they?'

Not a syllable was uttered in reply.

'Where are the guns?' cried Mina with a loud voice and irritated manner—'the mortars you decorated with garlands, because you supposed they were shortly to be used against the queen's forces?'

The people continued silent.

Whilst this was going on—the eyes of the staff-officers and the troops being all fixed on the general and the

villagers—the cura had managed to glide into a narrow alley by the side of the church (at the back of which, by a strange oversight, no sentinel had been placed), then darting down a lane, he crossed a rivulet at the end, and plunged into a dell covered with brushwood: thence, through paths well known to him, he bent his course towards a small town about a league off, where he knew there was a Carlist garrison.

Mina, finding he could not make any impression on the determined people before him, turned sharply round with the intention of commanding the cura to use his influence to induce them to give him the information he required; not seeing him, he said, 'Where is the cura? Search the church!—search his house!'

In the former there was not a living being; and at the latter only the ama, or housekeeper, a good-looking young woman, who declared that she had not seen his reverence since he was summoned to the general's presence early in the morning.

This being reported to Mina, he shrugged his shoulders, and proceeded once more to harangue the multitude:—'Well,' he said, 'you appear resolved to refuse giving me the information I ask for: now, listen to the voice of Mina, who never promises nor threatens in vain. If, in one quarter of an hour by this watch (drawing it from his pocket), the place where the Carlist mortars are hidden be not divulged, I will decimate the men now before me. Every tenth man shall be instantly shot: decide for yourselves.'

It was a fearful quarter of an hour. Each man was joined by a female—a mother, wife, sister, or one to whom his heart was devoted: the only individual unnoticed by any of the women was the gipsy. He was a stranger in the village, and belonged to a race for which there was no sympathy on the part of the Navarrese, although its members were at that early period of the civil war employed on important missions by the Carlist chieftains. He stood alone with his arms folded, and was apparently in a state of abstraction.

The drum was beat—the quarter of an hour had elapsed: the soldiers again began to separate the men from the women. In the confusion, the idiot boy crept up to the gipsy, and roused him from his reverie by saying in a half-whisper, 'Ho, Senor Gitano! stand last on the line, and you are safe.'

The stranger looked intently for an instant at the lad, who rubbed the palms of his hands together, and glanced confidently towards the extremity of the line of men now almost formed. The gipsy contrived to place himself the last.

Silence having been commanded and obtained, Mina said, 'This is the last moment—confession or decimation.' No answer, no sign.

'Sergeant, do your duty,' said the general.

Immediately a non-commissioned officer began counting along the line. On arriving at the tenth man, he was made to stand forth. The sergeant then went on reckoning in like manner. Four more were thus selected. The sergeant recommenced counting. There were but nine left, the gipsy being the ninth. The rank was closed up again, and the five men were left standing about a yard in front of the others. An officer and eight soldiers now marched into the centre of the plaza; and the villager, who had the unenviable precedence in this mournful selection, was led to the general, who thus addressed him: 'Reveal the hiding-place, and you are safe. I should rejoice if your life could be spared.'

'Senor,' replied the prisoner, a fine young man, 'I know it not.'

Mina rode to the front of the line of villagers and said, 'Will any of you confess, and save this youth?'

'The mortars did not pass through the village on their return,' cried the men.

Mina then rode to the rear, and questioned the women.

'General, general,' they all shrieked together, 'we know nothing of the mortars. Spare him, spare him; be merciful, for the love of God!'

This reply—this appeal for mercy—had scarcely been sent forth, ere a young and beautiful woman rushed from the group, and falling on her knees before Mina, exclaimed in imploring accents, 'Spare, oh spare my brother! He was all yesterday in the mountains cutting wood, and did not return till after nightfall.'

'There is no remedy,' replied Mina, 'unless the secret be disclosed.'

Five minutes after Mina's return to the spot where his staff were assembled, the young man was led to the wall of a house fronting the plaza; his arms were pinioned, and a handkerchief was tied over his face. He was then shot dead by four soldiers, who all fired at one and the same instant. Three more shared a similar fate, after every endeavour to induce them or the other villagers to give information concerning the mortars. They all met their fate with heroic calmness and dignity. The fifth was an old man. His anxious eyes had followed each of his fellow-captives to the death-station. His own turn was now at hand. There lay the bleeding corpses of his young companions, and he was interrogated as they had been previously to their execution. 'I call God to witness,' cried the aged man, 'that I know nothing of the matter. I confess to having been present when the mortars passed through on their way to Elizondo, but I was not here when they were brought back.'

'Tis true, 'tis true,' shouted the people, forgetting, in the fearful excitement of the moment, that they were condemning themselves by this declaration.

'Then save his life by confessing,' answered Mina.

'We have nought to confess; Francisco is innocent,' was the universal reply, to which succeeded a sepulchral silence.

As the old man was being conducted towards the wall where lay the four dead bodies, he passed close to Mina's horse; and at the moment when his arms were about to be tied behind him by two soldiers, he broke from them, and casting himself on his knees, clasped the general's thigh with both his shrivelled hands, crying, 'For the love of the Holy Virgin, spare me, spare me! Oh! by the affection you bore your own father, save the life of an aged parent! I never saw the mortars after they left the village the first day.'

Mina moved not; his face appeared as though it had been chiselled out of a block of brown stone. The two soldiers in vain endeavoured to loosen the poor old man's hands from Mina's thigh: he clung to, and grasped it with all the strength of desperation. At length, however, by dint of repeated efforts, he was removed, and having been taken in a state of exhaustion to the fatal wall, he speedily fell, pierced by the deadly bullets.

After this awful execution, Mina said, in a loud voice, 'Now let the last man in the line be brought forward.'

Mina had observed, immediately after the old villager had been shot, that an interchange of glances full of meaning took place between the gipsy and the half-witted boy; and surmised, all at once, that the stranger might be influenced by the fear of death to divulge the secret.

On hearing the order for his being brought forward, the gitano's swarthy complexion assumed a deep yellow tinge, and he trembled from head to foot. 'You have but five minutes to live unless the mortars be found,' said Mina, addressing the gitano.

The moral construction of the gipsy was of a very different nature to that of the peasantry of the northern provinces of Spain, although he had been a zealous hired agent of the Carlist junta in stirring up the people to the pitch of enthusiasm to which the Navarrese had been wrought at that period, under the idea that all their rights, privileges, and religious observances were at stake, and could only be secured by the annihilation of the Christians. He had expected to escape by means of the position in which he had contrived to place himself on the line of villagers, and had therefore

remained silent during the previous interrogations; but now, finding that the very manoeuvres he had put in practice to save his life had, on the contrary, brought him to the verge of destruction, he lost all command over himself. In tremulous accents he begged permission to speak privately to the general. He was led, tottering from fright, to the side of his horse. Mina was obliged to stoop to listen to his almost inaudible whisper, rendered doubly indistinct by the chattering of his teeth. 'Senor Mina, my general,' he muttered, 'if I divulge the secret, will you take me with you? Will you protect me from the vengeance of these villagers?'

'I will,' answered Mina.

'Then—send a party of soldiers, with some pioneers, down the lane to the left of the church, and when they arrive at a spot where there are three evergreen oaks, let them turn into a field to the right; in the centre of it they will see a heap of manure; let that be removed; then let them dig about three feet deep, and they will find the mortars.'

Mina instantly gave orders to the above effect; and during the absence of the party—about half an hour—a solemn silence reigned in the plaza. The gitano stood close to Mina's horse with downcast eyes, though occasionally he glanced furtively at the villagers, who all regarded him with menacing gravity.

At length a sergeant arrived from the exploring party, and informed Mina that the mortars had been found. 'Your life is spared,' said the general to the trembling gipsy, 'and your person shall be respected—you march with us.'

It took the greater part of the day to get the mortars exhumed and placed in bullock-cars pressed from the inhabitants, who were also compelled to dig up the guns and hoist them into the wains, the owners of which were forced to guide the oxen, under a strong guard.

The foregoing narrative, the leading features of which are traced from facts, displays the indomitable spirit of the Navarrese peasantry. Heart-rending it is to reflect upon the frightful evils of civil war, which none can fully conceive but those who have been eye-witnesses of them.

LIFE IN THE SEWERS.

Few who walk along the streets of London, and see mile on mile of carriage-way and foot-pavement stretching out before them, and branching off on every side, reflect upon the vast and wonderful scheme of sewerage that extends underneath. From the remotest district of London to the river, small sewers flow into larger ones; and these again, after a long course and many windings, into the Thames. Were a map executed of these subterranean currents, so intricate, yet so regular, like the large veins and arteries of the body, it would convey a grander idea of the civilisation of the capital than even the magnificent streets, filled with the productions of the world, that extend above ground. Formed of substantial brick-work, well arched and secure, they represent a sunken capital which has been variously estimated at the enormous sum of from one million and a half to two millions sterling. It is an interesting sight when any one of the main sewers is under repair in a principal thoroughfare, to see how deep the excavation is, and how many lines of gas and fresh water pipes have to be traversed before the strong current of foul water, running in its capacious brick channel, is reached by the workmen. Several of these main sewers were open streams, meandering through the fields, before London became so gigantic as it is now; and among the number may be cited the Fleet, running from beyond Islington, through Bagnigge Wells, Clerkenwell, Finsbury, Holborn, and Farringdon Street, into the Thames, once capable, it appears, of bearing merchant vessels as far as Holborn; the Walbrook, running from Moorfields past

the Mansion-House, and by the church of St Stephen, Walbrook, and by Dowgate, into the Thames; and the Lang or Long Bourne, which still gives name to one of the wards of London.

Any one who has walked over Blackfriars or Waterloo Bridge when the tide is down, may have observed men and boys, and occasionally women, walking upon the shores of the river, knee deep in the slime, with baskets upon their backs, or slung over their arms, picking up pieces of wood that have been left behind by the tide, or bits of coal that have fallen from the numerous coal barges that come up laden from the Pool, where the collier vessels are moored, to discharge their cargoes at the wharfs further to the west. These 'mud-larks,' as they are sometimes called, bear generally a bad character, being accused of not contenting themselves with the prizes they find on the shore, but of robbing the coal barges or other vessels, on board of which they can creep at nightfall without detection. However this may be, their functions do not end with the shore, but in the sewer. With torch in hand, to preserve them from the attacks of numerous large and ferocious rats, they wade, sometimes almost up to the middle, through the stream of foul water, in search of stray articles that may have been thrown down the sinks of houses, or dropped through the loop-holes in the streets. They will at times travel for two or three miles in this way—by the light of their torches, aided occasionally by a gleam of sunshine from the grating by the wayside—far under the busy thoroughfares of Cornhill, Cheapside, the Strand, and Holborn, very seldom able to walk upright in the confined and dangerous vault, and often obliged to crawl on all fours like the rats, which are their greatest enemies. The articles they mostly find are potatoes and turnips, or bones, washed down the sinks by careless scullery-maids; pence and halfpence, and silver coins; occasionally a silver spoon or fork, the loss of which may have caused considerable distress and ill-will in some house above; and not unfrequently more valuable articles, which thieves, for fear of detection, have thrown down when they have been hard pressed by the officers of justice. It might be thought that a life amid the vilest filth, and amid so much danger and unpleasantness of every kind, would allure but few; but the hope of the great prizes sometimes discovered in this miserable way deprives it of its terrors, and all the principal sewers that branch into the Thames have their regular frequenters. Were it not that the tide gives them too little time for that purpose, they would extend their researches to the extremities of London; but two or three miles inland is the utmost bound of their peregrinations. Those who value their lives will not be tempted to extend their researches further, lest they should be drowned by the rising waters of the river.

About two years ago, these and some other particulars of their mode of life were first elicited in consequence of the following circumstance:—An old man who had long pursued this calling was suddenly missed. Every search was made for him by the few to whom he was known; and his wife and family, not without many fears that he had lost his way in the sewers, or had been surprised by the tide, and drowned in his efforts to escape, made anxious inquiries at every police office in London; but without receiving any tidings of his fate. Months elapsed, and his name was passing from the remembrance of all but those who had lost their husband and father by his disappearance, when a young man, passing with his torch up the Fleet, at nearly a mile distant from the place where it discharges itself into the Thames, was startled at seeing the figure of a man amid the darkness sitting at the junction of a smaller sewer with the main current of the Fleet. He shouted, but received no answer, and heard nothing but the rolling of the black and fetid water, and the splash or squeak of the numerous rats which he had alarmed. Advancing nearer, he held the light to the face of the silent figure, and beheld the ghastly countenance of a skeleton.

He was not a man of strong mind, and losing his self-possession in his horror, he stumbled against it and fell. His light was extinguished. His situation was now sufficiently awful; but the added horror of the total darkness recalled his startled faculties instead of scattering them entirely. He knew his way by the number of iron gratings at intervals above, and groped along cautiously, shouting as loudly as he could, to keep up his own courage, and to startle the rats from his path, lest he should tread upon one which would turn upon him and fasten on his flesh. Grating after grating was thus passed, and he heard the carriages rattling above whenever he came near, and at times the conversation of people. Once he stopped under a grating, by the side of which an old woman sat at her apple-stall, and overheard her discourse with her customers, and was tempted to give the alarm, that he might be drawn up. This, however, would have been a work of time, and he therefore decided to go on. He proceeded accordingly, and arrived at the Thames without accident, and immediately informed his companions of the discovery he had made. It was surmised at once that the skeleton was that of the man who had been so long missing. Information was given to the police, and a constable was despatched to see the issue. He would not, however, venture up the sewer, but remained by the river side to await the return of the three 'mud-larks' who went up with torches and a basket to bring out the remains of the dead man. They found, on reaching the spot, that the discoverer, in his fright, by falling against the skeleton, had overturned it from its sitting position. A skull, a mass of bones, with a few buttons, and a portion of his shoes, alone remained—his flesh and his attire having been devoured piecemeal by the rats. The remains were collected and brought out without accident. A coroner's inquest was held on the following day, and the identity was established by the buttons, the only means by which it could be proved. Of course it could never be known to a certainty how the life of this unfortunate being had been lost; but the general supposition was, either that he had been suffocated by foul air, or that he had been seized with a fit of apoplexy in that darksome sewer. The simple verdict 'found dead' was returned by the jury.

Such is the romance of common things; and such is one of the many marvels that lie around us and beneath us, observable only by those who are disposed to study the manners, the habits, and the struggles of the poor.

THE RETREAT OF THE TEN THOUSAND.

THERE are certain facts in ancient history to which popular attention is, at intervals, pointedly directed, because they bear a resemblance to some passing occurrence of the present time. Thus, the recent disastrous retreat of British troops from Cabul, in the heart of Asia, has caused much to be said of late, by way of comparison, of a like military evolution performed some two thousand years ago, under nearly similar circumstances, but with far more fortunate results. The historian to whom we are indebted for the details of this military expedition was Xenophon, a Greek philosopher and soldier who accompanied it. His simple and circumstantial narrative—called the *Anabasis* (literally, 'The going up')—is one of the most interesting specimens of literature which has been snatched from the wreck of time. A modern, and therefore to us a double interest has been infused into it by an indefatigable and learned eastern traveller, who, having lately passed over four-fifths of the route, has been able, from personal inspection, to identify the sites of most of the places mentioned by Xenophon, and thus to place the minute fidelity of his history beyond all question.* The small portion of the

* *Travels in the Track of the Ten Thousand Greeks*; being a geographical and descriptive account of the expedition of Cyrus, and of the retreat of the ten thousand Greeks, as related by Xenophon. By William F. Ainsworth, F.G.S., &c. surgeon to the late Euphrates expedition; author of *Travels in Asia Minor*, &c.

track which this writer did not visit, has fortunately been inspected by Major Rennel, and by Mr Hamilton Junior. From these various authors, ancient and modern, we propose furnishing our readers with a sketch of the renowned expedition under Cyrus; chiefly, however, in reference to its most celebrated events—the battle, and the retreat of the Greeks.

In the year 404 before Christ, the seat of the Persian empire was Babylon, and its sovereign Darius II. He had two sons, Artaxerxes Mnemon and Cyrus; the latter being satrap or viceroy over a large district of Asia Minor. In the same year Darius died, and Artaxerxes succeeded him. Cyrus conspired against his brother, in order to obtain the throne: his treason was discovered by Tissaphernes, satrap of another province, who happened to be in the capital, and it was only the intercession of his mother (Parysatis) which saved him from the death of a traitor. He was, moreover, restored to his government, and returned to it with a mind exasperated by disgrace, and meditating a revengeful return for his brother's clemency.

No sooner did Cyrus return than he collected a vast army of the Asiatics belonging to his own principality, secretly intending to march to Babylon against his brother. It happened at this time that Clearchus, a Spartan general, had landed from Greece to subdue the Byzantines, or inhabitants of modern Turkey; but, instead of obeying the orders of his superiors, had taken part with the people he had been sent to fight against. A second army of his own countrymen was shipped off against him, by whom he was defeated. In this terrible emergency he offered himself and his whole army to Cyrus, who received him with open arms, and paid him a large sum of money. Thus, despite the classical interest which Xenophon has thrown around this famous expedition, it was, in reality, composed entirely of rebels and traitors.

Having collected a sufficient number of men, Cyrus assembled the whole army at Sardes, in Lydia, which is now Sarte in the Turkish province of Anadolía. Cyrus deceived his army into the belief that he only intended to invade the country of the Psidians, none but the Greek general, Clearchus, being in the secret. Tissaphernes, however, on hearing of the vast equipment, suspected the truth, and posted off to the Persian king to put him on his guard. Thus Cyrus's main object, secrecy, was defeated.

It was here—at Sardes—that Xenophon joined the expedition; for he was not amongst the army of Clearchus when it first hired itself to the Persian. Being at Athens, Xenophon received a letter from Proxenus, a friend of his at Sardes, to come and he would introduce him to Cyrus. Xenophon, having consulted both the Delphian oracle and his master, Socrates, accepted the invitation. Curiosity to behold, rather than join so vast an army, appears chiefly to have prompted him. On arriving at Sardes, however, he volunteered into the service of Cyrus, under Clearchus.

Everything being ready, Cyrus commenced his undertaking, which was to march with his vast army 1505 geographic miles,* and then to fight his way to the throne of the most powerful empire then extant. On the 7th of February, in the year 401 B.C., three years after his father's death, and about two subsequent to the beginning of his preparations, Cyrus and his immense military train commenced their eastward march. Except the shifts to which he was occasionally put to conceal his real object from the soldiery, and the danger of desertion which impended when he was obliged at length to make it publicly known, nothing very startling occurred, till—arrived at a spot on the banks of the Euphrates within about 108 miles of Babylon—there appeared the foot-prints and dung of horses, which were

judged to amount to about two thousand in number. In the onward progress of the army, it was perceived that this cavalry had burned all the forage, and laid waste the country which lay in the line of march, so as to deprive the invaders of provisions. Thus Cyrus, to his surprise and mortification, perceived that all his plans were known, and that his brother was fully prepared for his reception.

At about 72 miles north-west of Babylon Cyrus halted, and held a review at midnight; for he expected Artaxerxes would appear next morning at the head of his army to give him battle. This took place between the 1st and 9th of September (B.C. 401), eight months after setting out from Sardes. At the review, it was ascertained that the effective force consisted of 10,400 heavy-armed Greeks, and 2400 targeteers of the same nation; and that of the native Asiatics from his viceroyalty (always called by Xenophon 'Barbarians'), there were 100,000 men, with about twenty chariots armed with scythes.

The next day Cyrus commanded his army to march in order of battle. They had only proceeded four miles and a half, when they came upon a trench, five fathoms broad, three deep, and thirty-six miles long, which had been dug across their route, between the Euphrates and Tigris, by way of fortification. This the invaders were allowed to pass unmolested, probably to throw them off their guard; an effect, indeed, it seems to have had, for they concluded that the Persians had given over all thoughts of fighting. Hence Cyrus marched with less circumspection; and the third day rode in his car, very few marching before him in their ranks; and great part of the soldiers observed no order, their arms being carried in wagons and upon sumpter-horses.

'It was approaching,' as Xenophon expresses it, 'about the time of day when the market is usually crowded, the army being near the place where they proposed to encamp, when Patagyas, a Persian, one of those whom Cyrus most confided in, was seen riding towards them at full speed, his horse all in a sweat, and calling to every one he met, both in his own language and in Greek, that the king was at hand with a vast army, marching in order of battle; which occasioned a general confusion among the Greeks, all expecting he would charge them before they had put themselves in order: but Cyrus, leaping from his car, put on his corslet, then mounting his horse, took his javelin in his hand, ordered all the rest to arm, and every man to take his post; by virtue of which command the entire army was skilfully disposed by the various generals in battle array.' This happened in the plain of Cunaxa, on the Euphrates, called at present Imseyab. 'It was now,' says Xenophon, 'the middle of the day, and no enemy was yet to be seen; but in the afternoon there appeared a dust like a white cloud, which not long after spread itself like a darkness over the plain! When they drew nearer, the brazen armour flashed, and their spears and ranks appeared, having on their left a body of horse armed in white corselets (said to be commanded by Tissaphernes), and followed by those with Persian bucklers, besides heavy-armed men with wooden shields reaching down to their feet (said to be Egyptians), and other horse and archers, all which marched according to their respective countries, each nation being drawn up in a solid oblong square; and before them were disposed, at a considerable distance from one another, chariots armed with scythes fixed aslant at the axletrees, with others under the body of the chariot, pointing downwards, that so they might cut asunder everything they encountered, by driving them among the ranks of the Greeks, to break them.

'The Persians came regularly on; the Greek army standing on the same ground, the ranks being formed as the men came up: in the meantime, Cyrus, riding at a small distance before the ranks, surveying both the enemy's army and his own, was observed by Xenophon, who rode up to him and asked whether he had anything to command? Cyrus, stopping his horse, or-

Parker, London: 1844. The entire space travelled over by the Grecian army was 3465 geographical miles, only 800 of which Mr Alshworth left untraversed.

* Such being the distance from Sardes to Babylon by the line of march he afterwards followed.

dered him to let all know that the sacrifices* and victims promised success. While he was saying this, upon hearing a voice running through the ranks, he asked him what it meant? Xenophon answered that the word was now giving for the second time. Cyrus, wondering who should give it, asked him what the word was; the other replied, "Jupiter the preserver, and victory." Cyrus replied, "I accept it; let that be the word." We stop for an instant to remark that these war-cries have descended down to modern times. The signal, 'England expects every man to do his duty,' given by Nelson at the battle of Trafalgar, is the last of these battle-mottos on record. Cyrus immediately returned to his post, and the two armies being now within three or four stadia of each other, the Greeks sung the Pæan, and began to advance against the enemy; but the motion occasioning a slight break in the line of battle, those who were left behind hastened their march, and at once gave a general shout, as their custom is when they invoke the god of war; and all ran forward, striking their shields with their pikes, as some say, to frighten the enemy's horses; so that the Persians, before coming within reach of their darts, turned their horses and fled; but the Greeks pursued them as fast as they could, calling out to one another not to run, but to follow in their ranks. Some of the chariots were borne through their own people without their charioteers; others through the Greeks, some of whom seeing them coming divided, while others being amazed, were taken unawares; but even these were reported to have received no harm; neither was there any other Greek hurt in the action, except one upon the left wing, who was said to have been wounded by an arrow.

Cyrus, seeing the Greeks victorious on their side, rejoiced in pursuit of the enemy, and was already worshipped as king by those about him. He was not so far transported as to leave his post, and join in the pursuit. He charged with his horse, but was unsuccessful. However, upon discovering Artaxerxes properly attended, he exclaimed, "I see the man!" and ran furiously at him, and striking him on the breast, wounded him through his corslet, as Ctesias the physician says, who affirms that he cured the hurt. While Cyrus was giving the blow, he received a wound under the eye from somebody who threw a javelin at him with great force. The king and Cyrus still engaged hand to hand. In this encounter Cyrus was slain. The whole of the Asiatics, or 'Barbarians,' were signally defeated by that division of the Persian army immediately commanded by Artaxerxes. The head and right hand of Cyrus were cut off on the spot where he was slain, and the king's army broke into and plundered his camp.

Meanwhile the Greeks pursued that division of the Persian forces they had previously routed to a village near to the trench before mentioned. 'Hereupon,' says Xenophon, 'the Greeks halted (it being near sunset), and, lying under their arms, rested themselves; in the meantime wondering that neither Cyrus appeared, nor any one from him; not knowing he was dead, but imagined that he was either led away by the pursuit, or had rode forward to possess himself of some post. However, they consulted among themselves whether they should stay where they were, and send for their baggage, or return to their camp. Resolving upon the latter course, and arriving at their tents about supper-time, they found the greatest part of their baggage plundered, with all the provisions, besides the carriages, which, as it was said, amounted to four hundred, full of flour and wine, which Cyrus had prepared, in order to distribute them among the Greeks, lest at any time his army should labour under the want of necessities; but they were all so rifled by the king's troops, that the greatest part of the Greeks had no supper: neither had they eaten any din-

ner; for before the army could halt in order to dine, the king appeared. And in this manner they passed the night.'

The next morning Clearchus and the Greeks were made to see the full extent of the danger in which they were placed. They found themselves nearly two thousand miles from home, in the midst of the territories of an enemy at whose mercy they were. They were, in fact, surrounded on all sides. In the evening heralds arrived from Artaxerxes ordering the Greeks to deliver up their arms. After some consultation amongst the Greek generals, they sent the following answer to the Persian king:—'If it is proposed we should be friends to the king, we shall be more valuable friends by preserving our arms than by parting with them; and if we are to go to war with him, we shall make war with greater advantage by keeping our arms than by delivering them!' To this it was replied, that if the Greeks attempted to retreat, Artaxerxes would attack them. Afterwards, however, he consented to a truce.

Ariæus, Cyrus's lieutenant-general, now offered to guide the Greeks through the country, if they decided upon forcing a retreat. This guidance Clearchus accepted, and about the 16th of September (a.c. 401) the Greeks commenced the retreat, which proved one of the most famous events in ancient history.

They had not marched far, when they had reason to suspect that Ariæus and his Asiatic followers had been tampered with by the Persians. This suspicion was strengthened when it was found that Tissaphernes was also hovering around their track with a second army, under pretence of returning to the seat of his viceroyalty. However, no actual hostile movement was made till after the Ten Thousand had crossed the Tigris, which they did between the 11th and the 29th of October. Arrived on the northern bank of the Zabatus (now the 'Zah,' a feeder of the Tigris), the Greeks entered into a friendly conference with Tissaphernes, who invited Clearchus to a conference in his quarters. After some debate amongst the Greeks, their chief consented to accept the invitation, but with the precaution of being accompanied by five generals, twenty captains, and about two hundred soldiers, who went under pretence of buying provisions. 'When they came to the door of Tissaphernes, the generals, Proxenus, a Boeotian, Menon, a Thessalian, Agias, an Arcadian, Clearchus, a Lacedæmonian, and Socrates, an Achaian, were called in; the captains stayed without. Not long after, at a given signal, those who were within were apprehended, and those without cut to pieces. After this, some of the Barbarian horse, scouring the plain, killed all the Greeks they met with, both freemen and slaves. The Greeks, from their camp, seeing these excursions of the horse, were surprised, and in doubt of what they were doing, till Nicarchus, an Arcadian, came flying from them, being wounded in the belly, and bearing his bowels in his hands, and informed them of all that had passed. Upon this the Greeks were amazed, and expecting they would immediately come and attack their camp, ran to their arms. But they did not all come; only Ariæus, and ten other generals. 'When within hearing, Ariæus said, "Clearchus, O Greeks! having been found guilty of a violation both of his oath and of the article of peace, is justly punished with death. Of you the king demands your arms, for he says they are his, as having belonged to Cyrus, who was his subject." The snare here tendered was too palpable, and the Greeks answered indignantly, upbraiding Ariæus, whom they termed the most wicked of men.'

This treachery nerved the Greeks in their despair: they determined more firmly than ever to cut their way out of the country, or to die by the way; and proceeded to choose new generals, amongst whom was Xenophon, to whom was intrusted the command of the rear-guard. At this point the historian first appears as a prominent actor in his own narrative. Of the perfidy exhibited by Ariæus and Tissaphernes, Mr Ainsworth justly remarks, that it leaves 'an indelible stain on the Oriental

* It was the custom of the ancients to make sacrifices to the war-god before a battle. From the agonies of the victims when dying, they drew favourable or unfavourable auguries.

character, somewhat similar to that which belongs to our own era, after the lapse of twenty-two centuries, in the conduct of Akbar Khan and his Afghans to the retreating Britons.' It was under pretence of guiding the British troops from Cabul that Akbar Khan caused it to be cut to pieces in the fatal Khoord-Cabul pass. The massacre of the Greek generals in Tissaphernes' camp took place, according to Major Rennel's computation (which we have followed throughout), on the 29th of October, 401 years B.C.

With a very slender knowledge of the country, and with no other guide than the sun, the Greeks recommenced their northward retreat towards the Euxine or Black Sea, surrounded by enemies always hovering around their track. After many skirmishes and difficulties, marching near Nineveh, they came to an eminence that commanded the road, on which the Persians having got before them in the night, had obtained a position. This pass it was determined to force. 'On which occasion,' says the historian, 'there was a great shout raised, both by the Greek army and that of Tissaphernes, each encouraging their own men. Xenophon, riding by the side of his troops, called out to them, "Soldiers! think you are this minute contending to return to Greece—this minute to see your wives and children: after this momentary labour, we shall go on without any further opposition." Upon this a discontented soldier, whose name is preserved by the historian, Soteridas the Sicyonian, said, "We are not upon equal terms, O Xenophon! for you are on horseback, while I am greatly fatigued with carrying my shield." Xenophon, hearing this, leaped from his horse, and thrust him out of the ranks, and taking his shield, marched on as fast as he could. He had, however, on him a horseman's corselet, which impeded his progress, and the rest of the soldiers beat and abused Soteridas, and threw stones at him, till he was glad to retake his shield and go on. Xenophon then remounted, and led them on horseback as far as the way would allow; and when it became impassable for his horse, he hastened forward on foot. At last they gained the top of the mountain, and turned the position of the enemy, who then fled, every one as he could, leaving the Greeks masters of the eminence. Tissaphernes and Arisæus with their men turned out of the road, and went another way, while Cheirisophus (commander of the Greek vanguard) with his forces marched down into the plain, and encamped in a village abounding in everything. There were also many other villages in this plain, near the Tigris, full of all sorts of provisions.' The plain here alluded to, remarks Ainsworth, 'is evidently the district around the modern Jezireh Ibn 'Omar, the Bezabde of the Romans, and Zozarta of the Chaldeans.'

'When they came to their tents, the soldiers employed themselves in getting provisions, and the generals and captains assembled, and were in great perplexity; for on one side of them were exceeding high mountains, and on the other a river so deep, that when they sounded it with their pikes, the ends of them did not even appear above the water. While they were in this perplexity, a certain Rhodian came to them and said, "Gentlemen, I will undertake to carry over 4000 heavy-armed men at a time, if you will supply me with what I want, and give me a talent for my pains." Being asked what he wanted, "I shall want," says he, "two thousand leather bags. I see here great numbers of sheep, goats, oxen, and asses: if these are flayed, and their skins blown, we may easily pass the river with them. I shall also want the girths belonging to the sumpter-horses: with these," adds he, "I will fasten the bags to one another, and, hanging stones to them, let them down into the water instead of anchors, then tie up the bags at both ends, and when they are upon the water, lay fascines upon them, and cover them with earth. I will make you presently sensible," continues he, "that you cannot sink, for every bag will bear up two men, and the fascines and the earth will prevent them from slipping." This proposition affords one amongst a hun-

dred proofs furnished by modern travellers of the minute fidelity of Xenophon's narrative. Ainsworth states, that at about thirty miles from the junction of the Zab (on the banks of which the massacre of the Greek generals took place) with the Tigris, the 'actual ferry over the river, performed by means of rafts supported on inflated skins, exists in the present day at a place called Kelek Izedi, or the ferry of the Izedis or Yezidis.' The Rhodian's ingenuity was not, however, put to the test, for the Greeks decided on continuing their march along the eastern bank of the Tigris, and to enter Karduchia (Kurdistan). By a masterly manoeuvre, they managed to pass the mountains, and enter Kurdistan without molestation from the enemy. The spot they passed over was part of a remarkable district, it being 'the point,' says Ainsworth, 'where the lofty mountain chain, now designated as Jébel Jûdi, and the same, according to Chaldean, Syriac, and Arabian traditions, as that on which the ark rested, comes down to the very flood of the Tigris, which it encloses in an almost impassable barrier of rock.' After this we hear nothing more of Tissaphernes and Arisæus. The diligence and skill of the generals, and the indomitable perseverance of their followers, had completely baffled them. The retreat was, however, constantly impeded by new enemies, consisting of the various people through whose territories they passed in their northward course to the shores of the Euxine.

Arrived in the country of the Scythians (at present partly occupied by the Turkish province of Armenia), they reached a holy mountain called Theches (Kop Tagh), whence, to their inexpressible delight, the sea was visible. 'As soon as the men who were in the vanguard ascended the mountain, and saw the sea, they gave a great shout, which, when Xenophon and those in the rear heard, they concluded that some other enemies attacked them in front; for the people belonging to the country they had burned followed their rear, some of whom those who had charge of it had killed, and taken others prisoners in an ambuscade. The noise still increasing as they came nearer, and the men, as fast as they came up, running to those who still continued shouting, their cries swelled with their numbers, so that Xenophon, thinking something more than ordinary had happened, mounted on horseback, and, taking with him Lysius and his horse, rode up to their assistance; and presently they heard the soldiers calling out, "the sea! the sea!" and cheering one another. At this they all set a-running, the rear-guard as well as the rest, and the beasts of burden and horses were driven forward. When they were all come up to the top of the mountain they embraced one another, and also their generals and captains, with tears in their eyes; and immediately the men, by whose order it is not known, bringing together a great many stones, made a large mount, upon which they placed a great quantity of shields made of raw ox-hides, staves, and bucklers taken from the enemy.' 'Xenophon's description,' says Rennel, speaking of this scene, on the arrival of the vanguard of the army on mount Theches, when they caught the first glimpse of the sea, 'is highly pathetic. No one, we presume (and indeed hope), can read it without emotion. What a number of tender ideas must have crowded at once into their minds! The thoughts of home, wives, children, friends—thoughts which they had scarcely ventured to indulge before that moment! In a word, it was a prospect of deliverance; like an opening view of heaven to departing souls.'

Many of the towns on the southern shores of the Euxine having been originally Greek colonies, the retreating army were, with few exceptions, allowed to pass unmolested. As they were originally traitors to the republic of Athens, they of course made no attempt to return thither; but most of them settled in the Byzantine territories. The whole of the way, both of the expedition and of the retreat, comprised 215 days' march of 1155 parasangs, or leagues, and of 34,650 stadia, or 3465 geographic miles; and the time employed in both was a year and three months.

The first news Xenophon heard was that of his having been publicly banished from Athens for the part he had taken in the expedition of Cyrus, and having now become a general, he gave his services to Agesilaus in his Asiatic wars. Here he acquired both fame and riches. He afterwards retired to Scellus, a small Spartan town, where he wrote his *Anabasis* and the other works which have made his name revered by posterity. The rest of his time was employed in rural pursuits and amusements. Having been driven from his retreat to Corinth, he died there, 359 years before the Christian era, in the 90th year of his age.

THE CHAPLAIN'S REPORT ON THE PRESTON HOUSE OF CORRECTION.

Not the least satisfactory among the evidences of the moral progress of society—of the tendency, though slow and imperfect, to a better state of life and action than at present prevail—is the care bestowed on the moral and physical condition of criminals. Ventilation, cleanliness, order, and cheerfulness, are now found in those places which formerly were the most noisome dens of dirt, depravity, and despair; in which ignorance grew to villany, and lax principle to confirmed vice. In the treatment of the culprit at the present day, an object is aimed at beyond that even of the devoted Howard. Punishment is no longer regarded as the sole end of imprisonment; the reclamation of the offender, and his restoration to a steady course of life, now constitute the chief object of criminal discipline.

The publication of prison reports, while affording matter for congratulation, enables us to compare the statistics of former years with the actual amelioration. We have before us one of these reports, of a highly interesting nature, by the Rev. J. Clay, chaplain to the Preston House of Correction. In reading the statements which it gives as to the character of some of the prisoners, we cannot avoid noticing the apparently narrow boundary between a life of hope and usefulness, and one of crime and disgrace. All the facts which prison reports bring to light corroborate what has been so much insisted on in the evidence on the recent sanitary inquiries, that where the population is physically most wretched, there will be the greatest amount of crime. A miserable home, a dirty neighbourhood, have been the primary causes of ruin to many who, in a more favourable position, might have become respected members of society. The little hope that can be entertained for the cultivation of virtuous feelings, the fostering of good motives, amid surrounding depravity, has been frequently adverted to: the obvious inference is, that the deteriorating influences must be mitigated or removed, before we shall see the genuine fruits of the inculcation of sound morality. A gentleman, well known from his connexion with a leading London journal, has said, in reply to the remarks of his friends on this subject, 'You may talk about the effect of education on your labourers and workpeople as long as you please; but morality cannot exist on an empty stomach. I will take care that those on my estate shall be well clothed, housed, and fed, and will not shrink from any comparison with others.' This, though an extreme assertion, has nevertheless some foundation in truth.

The report now quoted sets out with stating that the improvement which has taken place in trade during the past year has had a material effect in diminishing the number of committals to the house of correction. In the year 1842-3 they amounted to 2050, while in the corresponding period of 1843-4 they were 1549. Foremost among the offences stand 'assaults on the police.' 'This offence always arises from intoxication—a vice which unfortunately becomes prominent as a cause of offence in proportion as increased wages permit increased indulgence in it.' We find the number of larcenies of 'exposed articles' serves as a sort of index of the seasons when work is abundant or scarce. 'During

a long period of embarrassment and distress, coal, clothing hung out to dry, and other unprotected property, tempted into crime the idle and the poor. In the last year, when all persons willing to take work could readily find it, offences of this description were less numerous by half than in the previous years.'

On referring to the table annexed to the report, it appears that the greater proportion of the petty larcenies are committed by the young; and the difficulty is pointed out 'of reforming a child who has been born and reared amidst poverty, neglect, and ill example. The evil which has grown with his growth and strengthened with his strength, cannot be remedied by the discipline proper to a jail. The first offence of a young criminal is generally followed by a sentence intended to check and to warn. This check and warning, where there have been some previous religious training, and where parents have been willing to assist in the reformation of their child, are found effectual—at least in preventing a relapse into crime.' When these conditions are wanting, the prospect of reformation seems all but hopeless, so great is the amount of labour and watchfulness required to produce it. From a boy in these circumstances, 'every injurious influence should be kept away; the powers of his mind should be roused; his affections should be cultivated; religious knowledge and religious principle should be engrafted, not merely as something to be occasionally referred to, but as the ever-present guide through the hours of his life. All this, it is manifest, cannot be accomplished in a prison. It may be said that an education is here contemplated for the little outcast felon attainable at present by few children belonging to a less degraded class. I can only reply, that such an education *ought* to be given, and when the country has a clearer perception of its duty and interests, *will* be given to all children, and especially to those who, without it, are sure to grow up in brutality and crime, miserable and degraded in themselves, a disgrace and peril to the community.'

The case of nine boys is then given, of whom 'six scarcely possessed a feeling or an idea which could be made available for good. They were ignorant of the alphabet, incapable of uttering a prayer, and unacquainted with even the name of the Saviour.' It is obvious that, on such offenders as those enumerated, the ordinary discipline of a prison will have but little effect. Solitary confinement, unaccompanied by any incentives to a better course of life, is undergone with a feeling in which repentance has no share. It is not regarded as remedial, but as a punishment; and in this view, in nine cases out of ten, the heart is hardened, and vicious habits confirmed. It is to be hoped that the light now thrown on the moral and physical condition of the lower orders of society, will have the effect of promoting the adoption of precautionary and preventive measures, whereby not only the injurers, but the injured will be gainers; for 'when the young criminal, liberated from the punishment of his first discovered offence, runs again into crime, and again stands convicted at the bar, the community demands the infliction upon him of a sentence rendered necessary by its own neglect; and pays a hundred pounds for the removal from the country of a dangerous pest, who, for one-tenth part of the money, might have been educated to fulfil, happily and creditably, the duties of the station for which Providence designed him.'

One of the tables illustrates the connexion between occupation and crime, which involves some important considerations. It will hardly be contended that any trade is in itself vicious; 'but if one demands more attention than another, leaving the person less exposed to the temptations of idleness; or if, on the contrary, an uneducated man's occupation be such as to allow a visit to the alehouse whenever he may be inclined, the probability is greater that, in the latter case, bad habits will be formed and criminal acts committed. It appears that the tendency to crime in the trades enumerated—beginning with the one most productive of

offence—is in the following series:—1, grooms, coachmen, postboys, &c.; 2, bricklayers; 3, colliers; 4, plasterers and slaters, &c.; 5, painters, plumbers, &c.; 7, machine-makers; 8, weavers; 9, carvers, &c.; 10, joiners; 11, butchers; 12, blacksmiths; 13, calico printers; 14, factory hands; 15, sawyers; 16, masons; 17, tailors; 18, shoemakers; 19, domestics (females); 20, factory hands (females). The first name and occupation on the list clearly shows the moral evils attendant on irregular employment. The 'colliers' appear to have been more remarkable for vice than for ignorance; and 'weavers' are less to be depended on than factory hands, because 'the ceaseless activity which must be exerted by every person in a cotton-mill affords, there is no doubt, a wholesome preventive to crime. In such places, where every one is under the eye of a vigilant director, there is no leisure for either planning or executing a scheme of plunder. But the case is widely different in regard to weavers; who, working at their own homes, are, with respect to the appropriation of their time, their own masters. Uncontrolled by the fear of losing a good situation, they can leave their employment at any moment, and for any length of time; and, under such circumstances, it is not surprising that temptation should find more victims among them than among the inmates of a well-regulated factory.' The class exhibiting the lowest number of offences is that of tailors and shoemakers; which may probably be accounted for by the fact of many in these trades having a stake in society, by carrying on a small business of their own: this requires a certain degree of attention, and excites a habit of reflection, which may induce the individual, even without the exercise of any high moral motive, to prefer the small but certain gain of his business, to the greater booty, which may be followed by detection, disgrace, and punishment.

We come next to the details given as to the treatment of prisoners: 'Every one, on his arrival, is taken to the reception ward, and an officer, appointed to the duty, enters in a book a minute description of his person, including his age, height, weight, &c. He is then placed in a warm bath, and, after undergoing a thorough cleansing, he is clothed in the dress appropriated to the class to which he may belong. His own clothing is washed and fumigated, and laid up in a well-arranged store-room, until he may require it again on his discharge.' If a prisoner be awaiting trial at the sessions, he has the choice allowed of passing his time in the work-room and yard, or of being placed in a new cell by himself. 'Wherever any sentiment of self-respect remains, wherever sorrow, or a sense of disgrace is weighing on the mind, the offer of separation is gladly embraced. A prisoner under summary conviction is generally, but not always, taken to the work-room. Should he be of any trade—that of a tailor, for instance—which can be exercised in the room or in a cell, he is employed accordingly; if otherwise, he is usually set to picking cotton. In the work-room the strictest silence is maintained, except when, the allotted tasks being completed, a prisoner reads aloud, for the benefit of his fellows, some proper book furnished for the purpose. From the moment of a prisoner's committal, he is informed of the rule forbidding communication by word, look, or gesture; he sees it operating in full force on all his fellow-prisoners; and should he for a moment imagine that, as a new comer, he may venture to violate it, after an admonition on his first offence, the stoppage of a meal, which follows his second experiment in disobedience, assures him that the prison authorities are in earnest.'

Some of the convictions are followed by a sentence of solitary confinement, in which case the meals are taken in the cells, and a discretionary power is exercised in giving work to the prisoner: the term, however, of this species of punishment never exceeds twenty-eight days. 'The seclusion tends to arouse beneficial workings of the mind: the memory, the conscience, and the feelings, seem to develop some of their latent powers, and to derive great moral benefit in their exercise. "Every-

thing that ever I did since I was a child has come back to me; and I see things now different to whatever I did before." Such remarks as this are often heard; and under the most unfavourable circumstances of ignorance, hardness, or levity, the irksome solitude may, and certainly does, fix in the mind a dread of the liability to such punishment again.

'All the prisoners attend the chapel every morning, and twice on the Sunday; a Bible and prayer-book are placed in their cells; they are allowed a due proportion of exercise, and the illiterate have the opportunity of joining the classes under the superintendence of the schoolmaster.'

A comparison is next drawn between the county of Lancaster and some of the agricultural counties, in which the result as regards moral progress comes out favourably for the former: we then meet with personal histories of some of the prisoners, which relieve occasionally the general darkness of criminal statistics; 'and perhaps the pursuit of mere knowledge under difficulties has seldom been illustrated more singularly than in the narrative of one of them sentenced to two months' imprisonment—"I am forty-four years old. I worked at the print-works at A— for 11s. a-week. I have a wife and seven children. I went first to a Baptist, and then to a Swedenborgian Sunday school until I was sixteen. I learned to read and write. I married when I was twenty-one. I was always fond of reading. I read all Swedenborg's works before I married. Afterwards I read Goldsmith, Hume, and Smollett. For thirteen or fourteen years I earned from 20s. to 30s. a-week, and I spent all I could spare in books, although I drank a little occasionally. My books altogether cost me between L.50 and L.60. In botany alone I spent more than L.10. After I read Hume and Smollett, I tried to master Guthrie's geography; then I read Goldsmith's Greece and Rome; then Rollin's Ancient History; then I bought Goldsmith's Natural History, edited by Brown. I joined a chemical society at A—, and bought Murray's Elementary Chemistry, and Ure's Chemical Dictionary. I afterwards bought Sheridan's, Walker's, and Bailey's Dictionaries. I took 20s. worth of Dr Adam Clarke's New Testament. When I took to botany, the Swedenborgian minister said a little Greek would assist me, and he made me a present of a Greek Testament; after that I got one of Bagster's editions, Greek and English; and I also bought two Greek Lexicons. The minister lent me Frey's Hebrew Lexicon, and I made some way in it, so that, when reading theology, I could make out any Hebrew words. I made most labour of botany, and got so far as to understand the cryptogamous plants. I only studied the system of Linnaeus; though Smith's Grammar contained both his system and Jussieu's. I continued reading these things until I came here. My children went to the Sunday school; but my wife was very fond of drink, and we had a wretched home. I have often had to carry her home like a log of wood. Her bad conduct spoiled the children." This man's dialect is the broad Lancashire, and would often be unintelligible to those who are not familiar with it.' A slight test of his chemical knowledge was made, by asking him to describe the process of respiration, which he did, according to the general views of it. He translated also several verses from the Greek gospel, though his acquaintance with the grammar and pronunciation was imperfect. Had this man been mated with a good wife, he would have had a cheerful home, well-conducted children, and all the happiness which a love of literature, in connexion with domestic comforts, seldom fails to induce.

We finish our notice of this excellent report with the concluding words of its author, who urges, as an apology for unusual length, 'the anxiety I feel to interest all who have wealth or influence not so much for a few prisoners, as for the thousands whom those prisoners in many respects represent: thousands who, if ignorant, have had no means of learning; if vicious, never saw or understood the beauty of virtue. Breathing the same

air, daily in our sight, we know them little better than we know the people of the opposite hemisphere. In my intercourse with them, few things have struck me more forcibly than the evidences of their complete non-intercourse with persons of superior intelligence and station. Yet this estrangement cherishes prejudices in each against the other, alike unfounded and mischievous; and for the interest and happiness of all, no efforts should be spared for their removal, and for the promotion of mutual confidence and respect.

MORNING.

THE morn is the birth-time of the new day, come to lend fresh light to enable us to renew our labours. It should be welcomed with joy and gladness, as the offer of another chance to us for the fulfilment of our hopes, and the accomplishment of our designs. He who feels that he has a load to bear, and much to do, should regard the first peep of day as a signal to be up and stirring in the battle with opposing circumstances. Early rising, which is nothing more than availing one's self of as much of the daylight as we can, has been a distinguishing habit in the character of most men who have achieved greatness in their professions, trades, and studies. In the middle of the day, we incessantly hear the anxious inquiry, 'What's o'clock?' and it is generally followed by the exclamation, 'Dear me, is it really so late! What shall I do?' It would sound more to the credit of such busy people to hear them asking, 'At what time will it be light-to-morrow morning?' and arranging matters overnight so as to be up at the exact hour. We have no doubt that in Britain there are thousands of young men (ah! and young women too) who have never beheld the beautiful spectacle of sunrise and the gradual opening of day. All the operas and plays that were ever performed we would have foregone, rather than they should have prevented us from attending the rising of the sun—a sight which cannot fail to impress the contemplative beholder with lessons of hope, endless diligence, and silent good-doing. The indefatigable, cheerful, kind old sun—who, it has been remarked, is almost the only thing that is the same to us in old age as in youth—rises early to inspect the world, and we ought to be up at his grand review. Do not disobey the summons of so exemplary a general, but let your eyelids

"open to his rising ray,
And close when Nature bids at close of day."

Our ancestors did wisely in acting their plays at such seasonable hours of the day as would not interfere with people's retiring to bed at such time as would allow of their rising next morning with the lark. Late amusements and late suppers are evils that call loudly for reform. The next day's business suffers from them. The old admonitory song of

"Early to bed, and early to rise,
Makes a man healthy, wealthy, and wise,

ought to be written in large letters on the walls of every ball-room, supper-room, and bed-chamber. Good useful maxims like that would be much more agreeable than the fantastic and unmeaning patterns of the paper-stainer. If argument be not sufficient with men who have the inclination to get up betimes, but want the courage to do so, let them imitate the example of Buffon. 'In my youth,' says he, 'I was very fond of my bed, but my old servant Joseph greatly assisted me to conquer that propensity; for I promised to reward him every time that he aroused me at six. The first few mornings I repulsed him, and treated his calls with ill humour, which was making him give way to me again; and then I begged of him not to mind my temper, but insist on my rising, and so earn his reward according to promise. "If you let me sleep, Joseph, you will gain nothing, and I shall lose my time; so think only of my promise, and do not listen to my threats." The next morning, and ever after, he forced

me, in spite of my anger, to rise at six; and when I was thoroughly dressed, and perfectly refreshed, I thanked and rewarded him. To poor Joseph's perseverance in waking me at six, I attribute ten or twelve volumes of my works.' The industrious and accomplished young naturalist Kuhl, used to fee the watchman to give an early pull at a string hung out of a window, and fastened to his toe while in bed. On this being pulled, the youth used to rise immediately and commence his arduous studies, wherein he made such progress, that he astonished the oldest professors who conversed with him. Linnaeus used, in summer, to go to bed at ten, and rise at three; in winter, he went to bed at nine, and rose at seven. A young nobleman, who visited Apsley House, was shown the truckle-bed in which the Duke of Wellington sleeps, and being astonished at its narrow dimensions, said, 'Why, there isn't room to turn in it!' 'Turn in it!' exclaimed his Grace; 'when once a man begins to turn in his bed, it is time to turn out.'

Late rising is not the habit of the very highest classes, for royalty itself sets the contrary example; and we have met, before now, princes taking their ride before breakfast at six o'clock. The present king of Hanover we have repeatedly seen out at that time. We have known Lord Brougham, when chancellor, make appointments on matters of business at his private residence for eight o'clock in the morning; his own time of rising being four in summer, and half-past six in winter. Supposing that a man rises at six, instead of eight, every morning of his life, he will save, in the course of forty years, twenty-nine thousand hours, which is a great accession of available time for study or business despatch; being, in fact, a gaining of three years, four months, two weeks, and six days. To any person of foresight, calculation, and industry, this fact will prove a sufficient temptation to practise the healthy and useful habit of early rising.

CALLING OF THE SEA.

As the foreknowledge of approaching changes in the weather is of importance, especially to fishermen and agriculturists, I invite attention to a very common, but not generally known, indication of such changes. In Mount's Bay, and probably in all places similarly situated, there is often heard inland, at a distance from the shore, a peculiar hollow, murmuring sound, locally termed 'the calling of the sea,' which, if proceeding from a direction different from the wind at the time, is almost always followed by a change of wind, generally within twelve, but sometimes not until a lapse of twenty-four or even thirty hours. It is heard sometimes at the distance of several miles, although on the shore from which it proceeds the sea may not be louder than usual; and yet at other times, even when the sea on the shore is louder than usual, and in apparently equally favourable states of the atmosphere, it cannot be heard at the distance of a mile. When the sound, in fine weather, proceeds from the coves or cliffs on the west or south of the observer, it is followed by a wind from about west or south, accompanied generally with rain. When it comes from the east or north of the observer, a land-wind from about east or north succeeds, attended with fine weather in summer, and often with frost in winter. All my own observations during the last twelve months confirm the above statement; indeed none of those of whom I have inquired, and who have for many years been accustomed to observe these indications, can recollect a single instance of their failure. This sound must not be confounded with that arising from a 'ground sea,' which is the well-known agitation along the shore occasioned by a distant storm, and which may likewise often proceed from the direction subsequently taken by the wind; for this latter noise propagates itself in every direction, and chiefly in that of the wind; whereas the 'calling' is heard only from one direction, and usually contrary to the wind. Besides, if this 'calling' come from the north-eastern or inmost shore of the bay, and the wind afterwards change to that quarter, it could not possibly arise from a 'ground sea' produced by a distant storm from that direction. Hence it appears that the 'calling' of the sea depends not on the condition of the sea, but on that of the atmosphere. I am in-

SATURDAY, FEBRUARY 22, 1845.

PRICE 1½d.

'BONA FIDE.'

It would be of great importance if any philosophical writer could lay down something like a rule as to the extent to which the tendency to feign and deceive exists in our race. At present, all is vagueness and uncertainty on this point. We see tremendous cases of imposture, and know that insincerity prevails throughout the whole of artificial life. But there is much truth and candour also, and often hollowness is suspected and attributed where in reality no such thing exists. Perplexities thus arise, and it becomes unavoidable that, where a question is to be argued upon the mere probability or improbability of there being good faith in the persons concerned, we are left each to his own accidental sense of the secretive power of human nature, or the charity which he may feel with regard either to his fellow-creatures in general, or to the particular individuals for the time under judgment. Were there, on the contrary, some fixed ideas respecting the capability of, and tendency to, deception in the human breast, we might expect to see many things pronounced upon much more clearly and promptly than at present, and a vast amount of unprofitable disputation spared. Perhaps, in the necessary absence of an authoritative rule on this subject, I may be allowed to make a few remarks on points connected with it, thus helping a little towards the desired end.

There are perhaps few things more astounding to the public than to find one of its members, after a long course of fair seeming, accompanied by unusually strong moral professions, all at once prove to have been, during the whole time, deeply dyed with some gross vice, or engaged in a professional course tending to the betrayal of all who confided their interests to his care. The common explanation is—he was a hypocrite all the time; that is, the real character operated in the concealed transgressions, and the outward appearances were entirely assumed for the purpose of cloaking the corruption underneath. This is a ready and plausible way of solving the mystery; but there is certainly much room to doubt if it be the right one. It proceeds upon the supposition, manifestly untenable, that there can be no opposite dispositions in human nature. We know, on the contrary, from daily experience in our own consciousness, if from no other source, that human nature is—as it has been proclaimed in all ages—full of inconsistencies. The simple truth is, that this nature comprehends many *pairs* of tendencies (as pride and veneration, selfishness and benevolence, &c.) which are directly opposed to each other; and though most persons have the one or the other predominating, so as to produce, so far, a certain consistency of conduct, there are many who have them in such equipoise, as to be liable to act under the influence of each alternately, or at least to be,

in this respect, the mere puppets of circumstances. It is, then, not impossible that such mysterious delinquents were all along as sincere in their good professions as they were culpable in their acts, bating only the disturbance which a consciousness of error must occasion in some degree to a mind possessing also dispositions towards good; and this, after all, might be but a slight subtraction, seeing how wonderfully accommodating our minds generally are to inconsistent opinions and feelings of all kinds. It only remains to be considered whether there is most likelihood in the idea of a designed deception, or in the reverse.

Here I will admit at once the wonderful power which individuals have shown of imposing upon their fellow-creatures. The annals of malingering are sufficient in themselves to establish the vast extent of this power even in minds of a humble class. But I think it will generally be found, in cases of proved imposture, that the deception was for a limited time. It might be for a month—for six months—or a year. But cases where imposture was proved to have been sustained quite perfectly for a large portion of a lifetime, are comparatively rare, and usually in such cases there was no object beyond the mere love of deceiving—the pleasure of masquerade—or whatever else we may choose to call it. Nor is all this wonderful; for there is nothing more difficult than to sustain a fictitious part for even a moderate space of time. Observe—the real nature continually tends to break out; there must, in such a case, be a constant restraint—one of the most unpleasant of all things. Then every tittle of the assumed character must be in keeping: we have, therefore, to presume such a degree of ingenuity in device, as well as of vigilance in maintaining guard over the behaviour, as would form a painful task to the ablest men even for a brief period. In short, there are so many difficulties to be presumed in the case of a life-long hypocrisy, that, though the idea is conceivable to all, hardly the most skilled tactician in reasoning could verify it. I therefore see little room for hesitating to affirm that the outward professions of the delinquents in question are much more likely to have been sincere than the contrary. Taking, for delicacy's sake, a historical instance by way of illustration, I would say that the ordinary idea entertained of Cromwell's character by his contemporaries of the opposite party, namely, that he was a bad ambitious man, who used pious professions as a means of imposing upon his countrymen and gaining his ends, is totally insupportable. The ability of any human being to go through such a career of twenty years, without a particle of faith on his own part in the religious ideas which he daily and hourly breathed, must be entirely denied. The real fact seems to be, that such men are in the first place self-deceived. They impose upon themselves, and then undesigningly impose

upon others. Perhaps we are not nearly yet aware of all the various influences which operate in swaying a certain class of minds towards a course which looks to cold reason like imposture, or the assumption of extraordinary gifts. But even taking such persons upon the grounds of what we know, their self-deceivableness is only too plain.

In the struggles of party, it is remarkable that each side invariably denies sincerity to the other. Each sees so clearly the truth of its own views, that it cannot imagine anything like an earnest conviction in the opposite. Each is so sensible of its own disinterestedness in its particular class of sentiments, that it cannot suppose a similar feeling being entertained respecting sentiments of a different kind. Hence it is that we so frequently hear from partisans that their opponents are entirely animated by love of power or self—that they make patriotism but a pretext for the advancement of their personal interests—that they affect a veneration for institutions merely for the sake of preserving what they have unjustly acquired—and many other allegations to a like purport. Even when the conduct of a party is, to all ordinary perceptions, marked by a denial of sordid interests, the spirit of opposition will find grounds for attributing it to motives different from those professed. And this spirit always becomes the more extreme in its judgments the more hotly that civil contentions are carried on; till, finally, in revolutions, we have men voting their opponents to death, not so much as a punishment for their acts, as from a horror at the false motives under which they are believed to have acted. This incapacity to see sincerity in opponents makes party-spirit one of the basest feelings which beset us. It is base, because it is so utterly destitute of magnanimity—because it treats candour as an impossibility—because it scoffs at faith, and continually libels human nature.

It is not difficult to see the causes of these false judgments in party men. Unwilling to allow that their opponents can be in any degree right, unable to conceive how any man can seriously think differently from themselves, they eagerly embrace the alternative, that all is false on that other side, and thus at once cut through the difficulty. Such errors are not a whit the less wild than are those which we make in deciding upon individual cases of presumed hypocrisy. A third and unconcerned party, looking coolly on, knows that there must be earnestness alike on both sides, even to produce that mutual charge of dishonesty in which they both take refuge. Great bodies of men may, no doubt, make a hollow show, or a deceptive move, occasionally; but to suppose that a multitude can truly conspire for anything, and particularly for the purpose of affecting a continuous strain of conduct not based upon or connected with their actual sentiments, is to suppose something of which we have not, in the whole range of human experience, one proved instance. It may be safely denied upon the mere incapacity of human nature to such an effect. The sceptical and distrustful have, it is true, a very practical and worldly air when they attribute extensive hypocrisies and deceptions; it looks safest to argue for human wickedness; but in reality such persons are the greatest dreamers, seeing that their surmises are, in degree at least, utterly irreconcilable with what we know of the laws of mind; while it is not less true that, in erroneously attributing or suspecting deception, an evil is incurred which may be not less than the actual fact of being deceived—a consideration too little regarded when we assume a distrustful line of conduct.

The illustrations here presented tend, it will be admitted, to lessen the presumption as to the power and inclination of men to put on deceptive appearances. Their purport is to leave human nature under a lighter charge of guilt in this respect than is usually assigned to it. Perhaps I may assert with some confidence, that we may safely attribute good faith, or at least deny its

one set of sentiments for the greater part of a lifetime, or find one strain of feeling and opinion pervading, for long or short spaces of time, any large body of men. The fact seems to be, that the true cause of the frequent deception which we experience from our fellow-creatures, is the liability on their part to self-deception and to misinterpretation of appearances. The erroneousness of their perceptions and judgments, the delusions arising from their feelings and wishes, are infinite; their power of actively and designingly deceiving is extremely small. In a word, the verb *deceive* is chiefly known in the passive voice. We are continually taking deceptions—almost tempting others to deceive us—putting a premium, as it were, upon imposture; but the disposition deliberately to set about plans for passing off tricks and impostures upon our fellow-creatures is actually or truly seen in but rare and limited instances. If this be sound philosophy, it becomes evident that what we are chiefly called upon to guard against in our dealings with men, is, not their bad faith, but their defective understanding and judgment. Human testimony is to be received as generally well meant, but liable to great error through the imperfection of the human intellect; and we are to judge of those who propose to be our leaders, or from whom we are called upon to take instruction, not so much with a jealousy as to their inclination to impose upon us, as with a caution lest they have been in the first place deceived themselves.

SOPHIA ROBERTES'S FLIRTATIONS.

On a cold frosty winter's morning, Mrs Robertes and her daughters sat in their luxurious morning room, engaged in various female occupations. There had been a silence of some minutes, which was broken by Harriet, the youngest of the three sisters, exclaiming, 'Really, Julia and Sophia, you are excessively entertaining this morning, almost as cheering as the weather. Have you nothing to tell us of Mrs Mackenzie's party?—was nobody either delightfully entertaining or charmingly absurd?'

'No,' replied Julia, 'it was too stupid even to laugh at afterwards; I never was more completely ennuyée in my life. I cannot imagine how it is, but it seems as if the very air of the place had the effect of destroying the power of being agreeable; for people who are really most charming elsewhere, are always dull at Mrs Mackenzie's.'

'Even the charming Miss Robertes; eh, Julia?' said Harriet; 'but I can explain the enigma. It is because the—the what shall I call it?—the assembly is presided over by the goddess of dulness herself in the shape of Mrs Mackenzie; and, you know, "What mortal can resist the yawn of gods?"'

'Come, come, Harriet,' said Sophia, 'Mrs Mackenzie does her best to make her house agreeable, and we should be grateful for her good intentions.'

'No, Sophia, it is just a case in which good intentions only aggravate the offence. It is high treason against pleasure for any one to give evening parties who is so utterly devoid of all qualifications, natural or acquired, for such an undertaking as Mrs Mackenzie. Such persons deserve no mercy.'

'For my part,' said Sophia, 'I must say I have been at more stupid parties than the one last night.'

'Well, certainly,' remarked Julia, 'I was wrong to say that everybody lost the power of being agreeable; I ought to have excepted Mr Lowe. By the by, Sophia, he is remarkably attentive.'

Sophia blushed slightly, and Harriet laughingly remarked, 'Oh, a solitary exception serves only to estab-

evidence cannot be admitted, as it appears you were not in circumstances to form a correct judgment.'

At this moment a servant entered with a letter for Sophia. She broke the seal, and after reading the first few lines, glanced her eye at the signature, whilst the colour rose to her temples. She then silently placed the letter before her mother, who, as she folded it up after reading it, said, 'Well, my dear, I am not surprised; nor are you, I daresay. From Mr Lowe's manner, I have rather expected this for some time. All you can do, my dear, is to write as kind and polite a note as possible, expressive of your great esteem, and so on; and regretting that it is not in your power to return the sentiments he expresses for you. Certainly he is an excellent young man; one whose person, manners, and character, are, as far as I know anything of him, unobjectionable; and your father tells me few young men are doing so well in business; still, your forming such a connexion is not to be thought of, he has so many relations all low people, and residing in the town too. Not one of them but is quite unrepresentable in anything like society. I pity him extremely; it really is a great misfortune for a rising young man to have such a host of vulgar relations.'

'But, mamma,' suggested Sophia, 'it surely is not necessary that Mr Lowe should be intimate with all his relations?'

'Certainly not; but it unfortunately happens that the very worst amongst them, the most vulgar and disagreeable, are the most nearly related; his brothers and sisters, for instance.'

'Besides,' added Julia, 'you know his opinions on that subject. Remember the severe remarks he made upon the conduct of Mr Seaton to his sister, who made that low match.'

'And,' said Harriet, laughing heartily, 'only fancy Sophia, with her refined taste and love for the intellectual, condemned to pass a long day with Mrs Jeremiah Lowe, in her fine house, where a book or an engraving is never to be seen from the first day of January to the last of December: but never mind, Sophia, I daresay she would entertain you charmingly with the cost of her tables and chairs, and the wonderful escape the splendid mirror in her drawing-room had during the last frost.'

'Yes,' chimed in Julia; 'and then there is Miss Tamar Lowe, who keeps your admirer's house (by the way, what very peculiar names they have in that family); what should you do with her, Sophia? Oh, retain her in your house to detail all the transgressions of the servants; how Patty threw a whole potato into the tub for the pigs, and John ruins all the edges of the knives.'

'And do not forget Mr and Mrs Pratt,' said Harriet, 'with their tribe of rough, ill-bred children, who must come and see Aunt Charles. Mind, Sophia, you always give us warning when you expect a visitation from the Pratts.'

'What nonsense you do talk,' said Sophia, with something very like a forced laugh.

'Nonsense do you call it?' replied Harriet; 'I call it very good sense; but remember, Sophia, I shall not be your bride's-maid in conjunction with Miss Tamar; that would be a sacrifice quite beyond my sisterly affection to make.'

'You need not concern yourself, Harriet,' said Mrs Robartes; 'I am sure Sophia has no idea of putting your affection to such a test.'

'Oh, indeed, mamma, I am not so sure of that,' returned Harriet, looking archly at her sister; 'what do you say, Sophia; is it quite impossible to get over the legion of relatives?'

'Yes, Harriet,' said her sister in a decided but low tone of voice; 'yes, I think, quite impossible.' But the words were followed by a sigh; for Sophia Robartes had never seen any young man she thought so agreeable as Charles Lowe.

Dr Robartes was a physician in good practice, residing in a populous town. He had been brought up to the profession of medicine, with the view of practising

as a surgeon; but having early in life married a lady of considerable property, he had, at her earnest and repeated solicitations, obtained a physician's diploma. Mrs Robartes was a handsome woman, and had what all her own particular acquaintances called most delightful manners. To these recommendations she united an intimate acquaintance with all the forms and refinements of polished society; but out of that particular division of the human race amongst whom she had all her life lived and moved, she knew little, and cared less. Like the insect in the magic circle, she moved round and round, incapable of penetrating beyond her own little sphere. She had, of course, as every well-bred woman has, a great horror of vice, and admiration of virtue; but she could better tolerate the one if veiled under a specious refinement and polished manner, than endure the other if accompanied by an awkward carriage and ignorance of the usages of polite life. As she often said to her daughters in the course of their education, 'I can do with anything but vulgarity,' meaning by vulgarity not coarseness of mind, but of manner. Brought up under such a mother, it will of course be concluded that the Misses Robartes were perfect in all the graces and accomplishments which, though they do not form a good foundation, are, it must be admitted, a very agreeable addition to female acquirements. Nor were they deficient in more solid and intellectual attainments, especially the two youngest; for Dr Robartes was a man of considerable and varied information, and by no means so great a slave to conventionalism as his wife; so that his company and conversation exercised a beneficial influence on the minds of his daughters. Sophia especially bore a striking resemblance to her father, which fact may perhaps account for Mr Charles Lowe's opinion, that Dr Robartes was a man of a high order, the only wonder to him being, how he ever came to marry so foolish and heartless a woman as his wife. Charles might be forgiven for entertaining a decidedly mean opinion of Mrs Robartes's penetration; for it was very evident that she did not properly appreciate him. He was in some measure aware of the obstacles which his numerous and not very refined relations presented to his forming such a matrimonial connexion as he wished; and though he believed it a prejudice, which a closer acquaintance with their many estimable qualities would do much to dissipate, yet this knowledge had for some time acted as a shield against the arrows of the little god. At length, however, the citadel had surrendered to the charms of Miss Sophia Robartes; and gathering hope from the young lady's encouraging manner, and her father's evident approbation, he ventured to address to her the letter which gave rise to the foregoing conversation.

We shall not attempt to describe the feelings of our hero on receiving Miss Sophia's letter expressive of regret and esteem; for never having been in the situation of a rejected lover ourselves, we might totally fail, which would be anything but pleasant. Or, supposing that, by a happy effort of genius, or an immense exertion of the imaginative faculties, we succeeded in faithfully portraying the effect of such a catastrophe on a mind such as his, to others of a more placid and resigned disposition it might seem over-coloured, whilst those of a still more ardent temperament would pronounce it tame and passionless. This much only we shall say, that Charles Lowe's feelings on first reading that properly-worded epistle were not unmixt with indignation, for he did think that he had not been well used. Miss Sophia Robartes had certainly given him tacit encouragement; and the more he reflected on the matter, the more he felt convinced, by many little signs which a man in love well knows how to interpret, that she was not indifferent to him. Believing that his rejection was solely owing to Mrs Robartes, and that this difficulty might be overcome, he made many efforts, but without success, to bring the young lady to some more decided expression of her sentiments. In this manner months dragged on, until sum-

mer, bright, cheering, glowing summer made its appearance. Now, the Robarteses were in the habit of going from home during the summer months to visit some fashionable watering-place. This had become a practice chiefly for amusement, and to distinguish themselves from the unfortunate vulgar who always vegetate in one spot. But this year Mrs Robartes had found herself compelled to acknowledge the humiliating fact, that she was afflicted with that very common complaint, the rheumatism, and consequently Dr Robartes issued his command that the summer's excursion must be to Buxton. Accordingly, in the brilliant month of July, thither did the family repair, the young ladies consoling themselves with the reflection, that though Buxton was not the place of all others they would have chosen, yet when the 12th of August came, numbers of young sportsmen would make it their headquarters. Now, fate had decreed that Miss Tamar Lowe should, from her youth up, have been a martyr to this same complaint; and Dr Robartes, good easy man, thinking that what was good for Mrs Robartes might be beneficial to Miss Tamar, and, with the perversity common to husbands, forgetting how far from agreeable it would be to his wife to acknowledge her in the presence of her genteel acquaintances, recommended his old patient to Buxton too. Charles Lowe was most affectionately urgent with his sister to follow Dr Robartes's advice; and offered, would she consent, to make such arrangements in his business as should enable him to accompany her; for though he certainly, had the choice been given him, would not have selected his sister as his companion at a watering-place, still, as he was sadly in want of a pretext for going himself, and as no better seemed likely to offer, he availed himself of it. Miss Tamar, quite flattered, agreed to go, 'though she knew things would be ruined at home, for want of somebody to look after them.'

We must now transport our readers to Buxton, a place in itself wonderful, and surrounded by some of nature's most beautiful and glorious scenes. It was a fiercely hot August morning (too hot for any place but Buxton, where there is always a fresh breeze), and the fashionable hour for promenading. Numerous gay groups were walking on the terraces, and amongst these none so distinguished for their elegance as the Robarteses. Mrs Robartes, in graceful and becoming invalid costume, was leaning upon the arm of her eldest son, Mr Percy Robartes, a young man just called to the bar, and remarkably gentleman-like, if dress and any conceivable amount of assumption give a claim to that title. The young ladies, blooming in youth, and radiant with gratified vanity, were accompanied by several of those desirable young sportsmen, whose company had been so anticipated. 'Miss Sophia,' exclaimed one of these young men, 'do look, I beg, at that most extraordinary old young lady just descending from that britska. Positively that is a gentlemanly-looking fellow, though, assisting the old quiz. One would think he must have expectations in that quarter.' Miss Sophia looked, and was dismayed; for she beheld her lover, Charles Lowe. And, alas! his companion was Miss Tamar: and, was ever anything more provoking, they chose that hotel for their resting-place at which she, her mamma, and sisters were staying. Mr Smythe, the gentleman who had addressed her, wondered why Miss Sophia made no reply to his remark; and was astonished at, though he could not but admire, the beautiful colour which rose indignantly as she pondered over the assurance of Mr Lowe in following her to Buxton. Yes, there they were. Miss Tamar, hot though it was, mindful of her rheumatism, looking not very unlike a bale of woollen goods; and persisting, despite her brother's unwillingness, in seeing all her packages safely deposited in the hotel. At last, satisfied that all was right, she disappeared; the carriage drove round to the stables; and Mr Lowe, after casting a hasty glance round, entered the house. When the ladies retired to dress for dinner, a cabinet council was held in Mrs Robartes's room. 'Well, mamma, what is to be

done now,' exclaimed Harriet; 'here is Charles Lowe come after Sophia, and has brought Miss Tamar with him, by way of fascinating her, I suppose?'

'Do not rattle so, Harriet,' interrupted her eldest sister; 'I do not see what there is to laugh at; for it really is too provoking that they should come here now to annoy us with their vulgar ways, when we have just become so intimate with the Churchills; and they so refined and exclusive, what must they think when they see us claimed as acquaintances by that odiously vulgar woman?'

'Yes,' said Sophia, 'though we really know little of her, she will always be so very intimate.'

'Well, my dears,' replied their mother, 'it certainly is a very unfortunate circumstance, but it cannot be helped now. We must make the best of it. Be lady-like, but as distant as possible in your manners; and, if she has not the sense to see that we do not wish for her acquaintance, surely her brother will, and endeavour to do something to keep his most extraordinary sister quiet.'

'Well, I hope he may succeed,' exclaimed Harriet, 'but for my part I do not think it possible; however, we shall see. Come, Sophia; never mind; arm yourself for fresh conquests. Mr Smythe is dazzled already. You wicked girl, I do not know how it is you manage to fascinate all the gentlemen, but I conclude it is the gentle timidity of your manners that flatters their lordly sense of superiority. Oh, commend me to a gentle, modest coquette; and now to dress, and then to dinner with what appetite the arrival of our evil genius in the shape of Miss Tamar has left us.'

When Charles Lowe entered the dining-room of the hotel with his sister on his arm, the first persons on whom his eye fell were the Robarteses, seated at the upper end of the table. He had previously ascertained that they were staying at this hotel, so that he was not entirely taken by surprise; but he certainly had not calculated upon the very cool return made to his bow of recognition. Mrs Robartes even put up her eye-glass; but at anything she might do, he could not be surprised. As last arrivals, he and his sister took their seats at the lower end of the table; and Miss Tamar, who really was short-sighted, did not at first discover her acquaintances. As soon, however, as she had settled herself comfortably, guarded her handsome silk dress from any chance spots of gravy, weighed the merits of the various dishes before her, and determined upon which to try, she began to look round upon the company.

'Why, Charles,' exclaimed she, 'there are the Robarteses. Well, how very lucky.' Then, stretching past her neighbour as far up the table as possible, she said, in a tone of voice sufficiently loud to arrest the attention of all present, 'How d'ye do, Mrs Robartes; I hope your rheumatism is better? As I've been saying to Charles, we're quite lucky to meet with you so soon, though the doctor told us we should find you here. And Miss Robartes, and Miss Sophia, and Miss Harriet (nodding to each as she named them), all looking as rosy as when they left Hilderston. Well, to be sure, what a pleasure it is to meet with friends.'

Alas! the persons she addressed could not echo this sentiment under the present circumstances; and they were painfully conscious that, whatever the fact might have been previously, it was most certainly true that they looked very rosy indeed at that moment. As for Miss Tamar, totally unconscious of the sensation she had excited, she with great equanimity commenced an attack upon a plate of boiled chicken and asparagus with which her brother had supplied her, so that her mouth was stopped for a time; but his feelings may be better imagined than described at this inauspicious opening of his Buxton campaign. At the head of the table sat an elderly gentleman of prepossessing appearance, and at his left hand a young lady, whose resemblance to the gentleman at once announced that she was his daughter. She was not handsome; but hers was a countenance that could not have been passed unnoticed

by the most indifferent observer. The open intellectual forehead, the eye at once soft and arch, the frank and good-humoured mouth, all bespoke a cultivated mind, a well-regulated temper, united with a kind and social disposition. To this young lady did Mrs Robartes now address herself.

'What a misfortune it is, Miss Churchill, to be the wife of a physician. People think that you must be intimate with all your husband's patients. Oh, my dear,' added she affectingly, 'never marry a professional man: if you wish only for the society of the *refined few*, be assured that you will be pounced upon by the *vulgar many*.'

'Indeed,' said the young lady very gravely; 'and you think that is the case in all the professions, do you?'

This was rather an embarrassing question to Mrs Robartes, for Mr Percy had been, much to his mother's satisfaction, paying Miss Churchill considerable attention: so, after a minute's silence, during which time the young lady appeared to wait anxiously for an answer, she said, 'No; perhaps not to all. I daresay it may be different in some; but what I have said certainly applies to the medical profession. Now,' continued she, 'that person who just addressed me in so vulgar a manner is, as you would gather, one of Dr Robartes's patients. They are nouveaux riches; and the young man is really very well informed and agreeable. We have occasionally met him; but of the sister I know absolutely nothing, and yet you see how she claims me for an acquaintance. Of course she is a person I could never associate with, as she is thoroughly vulgar in all her ideas.'

Miss Churchill made no answer to this tirade except by a bow; but she thought if that benevolent countenance was the index of a thoroughly ill-bred mind, she would give up all belief in physiognomy. During the rest of dinner, Miss Tamar was so well occupied with the contents of her plate, and the conversation of an old gentleman, her neighbour, who related to her some most miraculous hydropathic cures for rheumatism, that she had not leisure to make any further attacks upon her friends the Robarteses.

Mr Churchill, a country gentleman of moderate fortune and good family, was a man of enlarged and cultivated mind, and truly liberal spirit; for he could appreciate talent, revere virtue, and esteem integrity of character and high principle wherever and amongst whomsoever found. Brought up with such principles, his daughter Helen was prepared to find ability and worth amongst all ranks, and to esteem them highly. The Robarteses called her exclusive. True, she was so in the best sense of the term; for she always wished excluded from her society the vulgar in mind and mean in character.

Mrs Churchill, a confirmed invalid, was now at Buxton for her health. When Helen entered her mother's room after dinner, she as usual related all the amusing occurrences of the day, and after describing Miss Tamar, her speech, and Mrs Robartes's horror, she said, 'Mamma, do you know I think that must be the very Miss Lowe Edward used to be so fond of when he was at school near Hilderston. If you remember, there was a Charles Lowe, whom he liked better than any of his schoolfellows; and Miss Lowe used to send them cakes and all sorts of good things; and sometimes he went to see her, and she was very kind and good-humoured, and so indulgent. Do you think it is the same, mamma? I shall go directly and inquire from Mrs Robartes. Edward would be so delighted to see his old friend again, she was such an especial favourite of his.'

'Do so, my dear,' replied her mother; 'and should you prove right in your conjecture, say from me that I shall be happy to see and thank her for her kindness to your brother.' To fulfil her intention, Miss Churchill made her appearance in the public drawing-room; but she had no occasion to make any inqui-

ries. Miss Tamar had heard the name Churchill mentioned at the dinner-table. She had a retentive memory for the names of those she had loved, or to whom she had ever had it in her power to render a kindness; and she was not long in ascertaining that this was the same family of Churchills whose son had shared with her young brother in all her kind attentions and indulgences. Miss Tamar never stood upon punctilio; she knew little, and cared less for etiquette. No sooner, then, did she see Miss Churchill's beaming countenance than she exclaimed, 'Yes, it is the very same; she is the image of her brother. My dear young lady, you'll excuse me, I am sure; but I want so much to hear of that brother of yours. How is he, and where is he? Dear me, how I should like to see him again. Charles, Charles, this is Miss Churchill, sister to your friend Edward Churchill.' Thus called upon, Charles, in some confusion, turned to acknowledge this singular introduction; but his embarrassment was immediately relieved by the well-bred cordiality with which Helen received her brother's friend. Great was the astonishment of the Robarteses when they found the acquaintance of the Lowes sought by such *very genteel* people; but from the conversation which passed, they learned one important fact—young Mr Churchill was expected. Here was an opportunity not to be neglected. The prudent mamma recommended her daughters to adopt a more courteous manner towards their Hilderston acquaintance, since they were likely to be intimate in that quarter. In the course of a few days Edward Churchill arrived, and he heartily renewed his intimacy with his old schoolfellow. Frank, gay, and light-hearted, Edward entered with great zest into all the pleasures and amusements of the place. He sang, danced, and flirted incomparably better than any gentleman there, and was, withal, so clever and good-humoured, that he soon became the life of the circle. For some time it appeared doubtful which of the ladies excited his especial admiration, so equally were his attentions and compliments bestowed from Miss Robartes to Miss Tamar Lowe; but at length his wavering choice fixed upon Miss Sophia, who from that time abandoned Mr Smythe to his fate—her mamma having assured her that he was not a marrying man. Nothing could be more agreeable to the Robarteses than the prospect of such an alliance, uniting the two great advantages of good property and unexceptionable family connexions; and Miss Sophia spared no pains to secure the captive she flattered herself she had made. One thing did rather puzzle her; she could not be quite sure what were his real sentiments towards the Lowes: but after some consideration, she decided that he was willing, for the amusement they afforded him, to renew an acquaintance at a watering-place with persons whose society nearer home he would not consider quite so desirable. It may perhaps excite some surprise that Edward should voluntarily place himself in rivalry with Charles; but the truth was, that, with the keen eye which young men often possess in such cases, he had from the first suspected how matters stood; and it was not long before he heard the whole history from his friend. But, said Charles in conclusion, 'I now see plainly that Sophia Robartes would not suit me. She is entirely a slave to appearances, and, with her views and feelings, nothing but family disunion could be expected. She looks with contempt on my relations, who, though deficient in that polish of manner which is to be obtained only early in life, possess intrinsic merit, which those who have the good sense and courage to penetrate beyond the mere outside, must discover and esteem.'

'Well, my dear fellow,' said Edward, 'in my opinion you have had a happy escape; but I think I must teach Miss Sophia a lesson on her folly. To be tied to a woman who lives in constant dread of the sneers of miscalled refined society, would be wretched indeed; so congratulate yourself.' And Charles did congratulate himself; for, his eyes being now completely opened to the motives and opinions of his former fair one, he could

not but be struck by the contrast between her and Miss Churchill. He saw Sophia Robertes lovely and accomplished, with a cultivated understanding, and a mind capable of appreciating everything good and noble, devoting all her charms, calling up all her fascinations, and bending all her energies to the task of securing such a connexion as should raise her in the scale of society; willingly lending herself to the exaggerated expression of admiration from a man of whose character, habits, and principles, she was almost totally ignorant, merely because he was what is called a good match. On the other hand, he saw Helen untainted by coquetry or affectation, courteous and obliging to all, unmindful of herself, intent on promoting the comfort and happiness of those dear to her, and as ready to produce her accomplishments for the gratification and amusement of Miss Tamar, as for those better able to appreciate them. He saw, and wondered how he could possibly have imagined himself in love with one whose character now appeared to him so contemptible. He did not, however, at first so plainly perceive where his wonderings and reflections were leading him. His acquaintance with her brother had placed him in a position of intimacy with Miss Churchill which none of the other gentlemen enjoyed. She liked his manners, admired his talents, and sympathised with the noble and generous sentiments he expressed, and with the benevolent and enlightened view he took of the advantages and opportunities afforded by his situation in life, as an extensive manufacturer, of benefiting his fellow-creatures. Her esteem for his character was much increased by his conduct towards his sister, and by the manner in which, when occasion required, he spoke of the rest of his family, whose peculiarities she had heard described and ridiculed by the Misses Robertes. When a young lady and gentlemen begin with mutual esteem and admiration, it is not difficult for lookers-on to see where it is most probable they will end. But Charles had not yet dared to hope, nor had a thought of him as a lover ever crossed Helen's mind; and the time fixed for their leaving Buxton was fast approaching. It had been settled that, previous to their departure, the Roberteses, Churchills, and, by Edward's express desire, the Lowes, together with several young ladies and gentlemen staying at the same hotel, should make an excursion to Castleton to view the many wonders of the Peak. Various emotions were brought into play by the prospect of this trip. Edward Churchill, true to his determination of teaching Sophia that if she would be a female flirt, she must expect to meet with masculine jilts, had paid her such attention as might fairly permit the inference that he admired her exceedingly, and that more unlikely things had happened than that he should wish to make her his wife.

So Sophia attired herself most becomingly, and thought that, wandering amidst the romantic scenery of the Peak, the anticipated offer surely must be made: whilst Edward soliloquised—'Now for the finale; I must bid Miss Sophia a polite adieu. Pity I cannot write a letter of esteem and proffered friendship.' In pursuance of his plan, Edward selected Miss Tamar as the object of his assiduous and most devoted attentions on their drive, conducted her with the utmost gallantry through the vaulted passages and widely-arched chambers of the cavern of the Peak, would allow no one to make the passage of the Styx with her but himself, and finished by giving her his arm in walking back to the inn. Here Miss Tamar declared her inability to proceed any farther in search of wonders and prospects, and made known her determination to give herself a 'comfortable rest and warm,' whilst they mounted the hill where stand the ruins of the once proud castle of the Peak.

'Really, Mr Edward,' said one of the young ladies when they were some little distance from the inn, 'how absent you are; don't you see Miss Sophia Robertes walking alone?'

'Indeed! Miss Sophia,' exclaimed he, 'I beg your

Deeply mortified though she was, she judged it better to pass over his neglect quietly; but as she accepted his proffered assistance, she remarked—'You seem to have enjoyed yourself much, Mr Edward?'

There was a touch of reproach in the tone of her voice; but his heart was callous, and he answered gaily, 'Oh yes, very much; I never was more interested and amused.'

'Ah,' said the lady, smiling affectedly, 'you are such a quizz.''

'A quizz,' he replied; 'excuse me for repeating your words so rudely, but I do not understand what you mean.'

'Oh, Mr Edward,' said Sophia, 'you know very well you have been quizzing; that is, laughing at Miss Tamar Lowe.'

'Indeed you are mistaken,' replied he. 'Of course I see Miss Tamar's eccentricities, and think them amusing; but to draw her out for the purpose of ridiculing her myself, or affording mirth to others, is an act of which I hope and believe I am incapable. I respect and esteem her highly: no one can help doing so who is acquainted as I am with her many excellences; and if no other motive restrained me, as the sister of my friend she is safe from any such attempt on my part.'

Sophia saw that she had got wrong, and to change the subject began to talk of leaving Buxton; of how much she had enjoyed herself, and wondered when the same party would meet again.

'Some of us, I hope, soon,' said Edward; 'Lowe is going with me to Oaklands, and after that I intend to renew my acquaintance with Hilderston. I suppose he has got a charming bachelor establishment; but if I am not very much mistaken, he would rather have a complete establishment for *two*. What do you think, Miss Sophia?'

Completely thrown off her guard by the concluding part of this speech, imagining that she must have been mistaken in Edward's motives, and that his intention the whole time had been to interest her for his friend, and not for himself, she replied, 'I believe you are quite correct: to my knowledge he has made some attempts in that way; but he is too ambitious. Mr Lowe must look for a wife in his own class, for no woman accustomed to good society could put up with his host of vulgar relations.'

'Do you think so,' said Edward coolly; 'I scarcely thought to have heard such an objection advanced in these days, when almost every one has vulgar relations of one kind or another; but I cannot say I agree with you. I think Charles has every chance of success in his present pursuit; for the lady, I know, never did trouble herself much about such subjects, having, I presume, sufficient self-esteem to keep on good terms with herself, despite her share of the small annoyances to which the happiest state in this life is liable.'

Poor Sophia! The blow was almost too much even for her well-tutored, self-possessed manners. She felt sick and giddy as the truth flashed across her mind that she had lost her old lover, and, far from gaining another, was actually an object of amusement, if not of contempt, to the man she had considered her captive. Bitterly was she mortified: yet so much are we the slaves of habit, and so difficult is it to free the mind from long-indulged prejudices, that she felt only aggrieved and wronged by the turn affairs had taken. Her attention once awakened, however, she was too acute an observer not to be convinced of the truth of Edward Churchill's hints; and after several hours passed in vain efforts to assume gaiety of manner, she found herself alone, and at liberty to give vent to her long-suppressed feelings by bitter tears of mortified vanity and wounded self-love. Of all the family of Roberteses, none were more rejoiced at the termination of their Buxton campaign than Sophia; who, ill at ease, and wanting the sustaining influence of self-respect, imagined herself deeply injured both by the Lowes and Churchills, and tried to

be to regain the ease and contentment she had lost. When, however, some months had passed away, and calm reflection succeeded to this tumult of feeling, Sophia Robertes became wiser and happier for her experience. Influenced by the sole desire of securing a good establishment, she had been for a time mortified by the failure of her projects; but she had too much good sense not to draw a useful lesson from the past. From the time of her visit to Buxton, the character of Sophia underwent a gradual change. Having once had the courage to find herself in the wrong, to look her errors in the face, and acknowledge them as such, she acquired strength to forsake them. Thoroughly ashamed of her heartless conduct towards Charles, she endeavoured, by respectful attention to his family when thrown into their society, to atone for her past hauteur. Perhaps nothing tended more to confirm and strengthen Sophia's altered views than witnessing the domestic happiness experienced by her former lover and his charming wife. In Helen she observed the rare union of true dignity and firmness with an unusually conciliating address; and she found it both instructive and amusing to observe the tact with which she contrived to steer clear of undue familiarity on the one hand, and an assumption of superiority on the other. With her husband's relatives the young wife was a universal favourite; whilst the qualities of her mind, and simple lady-like manners, caused her society to be courted by the truly estimable and refined. With such a standard, it is no wonder that Sophia Robertes became as superior in character as she had ever been in personal and mental qualifications; nor is it matter of great surprise that Edward Churchill should, when again thrown into her society, find her a charming girl, as unlike as possible to his Buxton belle. As the chosen friend of his sister, Edward had many opportunities of familiar intercourse with Sophia; and he did not deem it her least attraction that she bore him no ill-will for his former gallantry and subsequent neglect. With the cordial approbation of all his friends, Edward at length made Sophia an offer of his hand and heart, which offer being considered by the young lady's friends every way eligible, and by none more so than by Sophia herself, was duly and formally accepted. The good doctor rejoiced in the happiness of his favourite child; Mrs Robertes congratulated herself on the proper settlement of one of her daughters; and the sisters were well pleased with the anticipated bustle and éclat of a wedding, and the visits to the bride seen in the distance.

'Pray, Sophia, if I may venture upon such delicate ground,' asked Edward on the eve of his marriage, 'what have you done with your prejudices against Love's relations? Has it never occurred to you that there is certainly a fatality in these affairs, which dooms you, after all, to become a relative of Miss Tamar's?'

'With such an example before me of the power of affection to conquer prejudice and overcome aversion, I have not found it difficult to submit to my fate,' returned she archly.

'What do you mean?' asked Edward, colouring slightly, and with a touch of embarrassment in his manner.

'My dear Edward,' said Sophia, 'you once thought me very foolish, proud, and prejudiced; and so I was; but if my pride took one direction, have I been wrong in supposing that yours took another, and that the peculiarities of Miss Tamar were not more offensive to me than what you considered the assumption of myself and family to you?'

'Well, I confess, my dear little Sophia, that I did think there was "much ado about nothing;" but "all is well that ends well;" and we may thank Miss Tamar for our happiness. Dear old lady, if it had not been for her, I do believe you would have accepted Charles, and then what would have become of poor unhappy me, to say nothing of Helen?' With this confession she was fain to rest content; but, years after her marriage, Sophia Churchill was heard to say that she owed much of her

happiness as a wife to the severe but salutary lesson which taught her the meanness and folly of Sophia Robertes's flirtations.

THE ZOLLVEREIN.

THIS word, which frequently occurs in the commercial articles of newspapers, signifies 'customs-confederation' (*zoll*, toll or custom, and *verein*, union or confederation), and applies to an agreement which has of late years been entered into by the governments of various German states to exact a uniform rate of duty upon imported goods, and to vest the management and collection of such dues in a central establishment. An explanation and short account of this union may be useful to some, and interesting to most of our readers.

Every tourist in Germany used to complain with very good reason of the inconvenient frequency with which he was made to stop on the road to get his passport examined. In the heart of Germany—which is made up of a cluster of petty states—he could scarcely travel a stage without having himself and his passport scrupulously examined by a policeman; for, as many of the ducal territories are not larger than a good-sized English estate, their frontiers lie pretty closely together. If, then, the mere pleasure tourist had to complain of this state of things, how much more reason had the merchants of the country to be dissatisfied, when they could not send the smallest packet of goods a few hundred miles without having it subjected to some half-dozen custom-house examinations, and having to pay upon it the same number of rates of duty? each little territory having a tariff of its own. By the time, therefore, a small parcel reached its destination, an amount of rates and duties had been accumulated upon it which perhaps exceeded its value. Moreover, it took a very good arithmetician to calculate the amount of the sum-total of dues which it had incurred; for every state had not only a separate tariff, but a distinct coinage and monetary system, all of which had to be assimilated on the bill of parcels by the merchant to whom the parcel was consigned. Hence in Germany commerce—which it is necessary to encourage by every possible facility of transit—was as complicated a business as can well be imagined.

Such enormous hindrances to trade could not, in the nature of things, be continued without some efforts towards amendment; and Prussia being the largest and most powerful of the German states, was therefore the best able to set reform on foot; which she did immediately after the battle of Waterloo had diffused the blessings of peace throughout Europe. Before, however, beginning to correct the fiscal faults of her neighbours, she commenced amending her own. A law was promulgated on the 26th May 1818, by which the old commercial restrictions, which excluded certain foreign articles from the Prussian market altogether, were removed, and foreign productions, whether natural or fabricated, were allowed to be freely imported, consumed, and conveyed throughout the whole breadth and length of the monarchy; whilst all home produce, whether raw or manufactured, was to be exported with equal freedom. Bounded, however, as Prussia is to a great extent by other territories, the new law would have been a dead letter, as regarded the land-carriage of goods to and from other countries, without the concurrence of neighbouring rulers, across one or other of whose boundaries merchandise destined for Prussia would have to pass, and to be subjected to their customs laws. The Prussian government therefore sought to induce them to join in this scheme; but so many obstacles supervened, by complexity of interests and jealousy of rights, that it was not till after several years of incessant negotiation that the object could be accomplished. Threats, intreaties, and concessions, however, prevailed, and at length the Prussian government was joined in its commercial scheme by the princes of Schwarzbourg, Sonderhausen, and Schwarzbourg-Ru-

dolstadt, the Grand Duke of Saxe-Weimar, the Duke of Anhalt-Bernbourg, the Grand Duke of Mecklenbourg-Schwerin, and the Duke of Anhalt-Dessau. Though none of their principalities are by any means extensive, yet the government of Prussia had more trouble and difficulty in negotiating and haggling with these petty rulers, than with all the more important states which afterwards joined the union.

Prussia, and the small territories which hang on her skirts, formed then a nucleus from which to spread the Zollverein further over the German continent. The Prussian government persevered, and, by 1826, had included in the union all those countries which extend on the north, east, and west, from Memel in the northernmost seaport of Prussia to Aix-la-Chapelle in Westphalia; and those from north to south, which lie between Stralsund and the Austrian frontier, behind Munich in Bavaria. The boundaries of the confederation are as follow: on the east, Russia and Poland; on the south, Austria and Switzerland; on the west, France; on the north-west, Belgium and Holland; and finally, on the north, Hanover and the other states which have hitherto declined to join this useful and vast commercial union. At present, it takes in about 8392 square miles, upon which reside a population equal to that of Great Britain and Ireland, being about twenty-seven millions. By the year 1831, the operations of the league were fully developed.

The leading effect of the Zollverein was to render that portion of Germany which we have indicated above, as one country. Throughout its entire extent a uniform rate of duty is charged in (happily for clerks and book-keepers) one sum at either of the boundaries we have mentioned, after which the goods thus taxed may be sent from one end of the united territories to another—from Aix-la-Chapelle to Tilsit, and from Stettin and Dantzic to the frontiers of Switzerland and Bohemia, without let or hindrance. The whole of the dues are collected and sent to a common and central treasury. The sum thus collected is periodically divided amongst the various governments which form the Zollverein.

In the early progress of the union, the difficulty of making the division equitably and fairly, opposed a great obstacle to the fulfilment of the scheme. After much deliberation, the following plan was resorted to, and appears to work to the satisfaction of all parties:—A basis of the calculation for apportioning the gross amount of dues is formed by the amount of the population of each territory, in proportion to the amount of which the revenues are, in the main, allotted to each state; but this calculation is wisely checked by the respective accounts kept in the line of customhouses established upon the frontiers within which the confederation exists. These calculations and payments are made once in every three years, when each government sends to the centre of management in Berlin an envoy or deputy to assist at the settlement of the accounts, and to propose such modifications or alteration in commercial taxation as time or change of circumstances may have rendered necessary in his particular district.

It is now necessary to say a word on the nature and amount of the duties levied by the Zollverein. In the first place, instead of publishing a cumbrous and inconvenient list of the scarcely numerable subjects of commerce, the framers of the Prussian tariff went on more comprehensive principles: they divided all articles of trade into five grand sections, ranging in each such things as had a similar origin or use. The first division includes foreign materials, which cannot be produced within the countries of the Zollverein; the second, foreign produce, which is produced within the union; the third, articles necessary to industry and manufactures; the fourth, manufactured goods; and the fifth, small wares. Upon the articles included in each of these sections a uniform duty is levied; but every three years those rates are altered—if possible, diminished. The tariff now in force having been settled on

the 1st January 1843, expires with the present year. The list of prohibited articles of import, which, previous to the union, was very great, is now reduced to two—salt and playing cards.

The liberal commercial principles which guided and were carried into effect by the Zollverein, have given a great impetus to German industry and commercial prosperity. Amongst other reforms, this useful league has swept away all tolls and other impediments which formerly obstructed the free navigation of the Rhine and the Elbe; and many mischievous monopolies held by companies and city guilds no longer obstruct the healthy working of competition.

The Zollverein has concluded treaties of commerce and navigation with every power in the world with whom a trading intercourse is worth having, and its flag is already flying in all the most important ports throughout the globe. Since 1834, the amount of dues collected has trebled. In 1843, the duties paid into the common treasury amounted to 23,121,324 thalers, equal to nearly £3,500,000 sterling. The commercial power which increasing prosperity gives, will in all probability force those states who have not yet joined the confederation to form a part of it, and at no distant day we may expect to find the union extending throughout the whole of the Germanic empire.

THE CURLERS' ANNUAL.

OUR English friends are, we believe, altogether unacquainted with a game practised amongst us under the name of *curling*. It is comparatively local even amongst ourselves, for in many districts of Scotland it has never been introduced: it may be said to reign chiefly in the south-west and central provinces, namely, the counties of Dumfries, Peebles, Edinburgh, Fife, and Perth. Comprehensively, it is *bowls played upon ice*, but with stones which slide instead of rolling, each being fitted with a handle whereby it is impelled. Depending as it does upon frost of some continuance, it is a game which no one ever gets time to tire of. Played upon the surfaces of ponds in gentlemen's parks, or upon rivers and lakes bosomed high amidst beautiful scenery, while the air is clear and sharp, and every shred of vegetation hung with nature's sparkling jewellery—while men know, too, that they are only allowed by our inconstant Jove to snatch a fearful joy—no sport can be more thoroughly delighted in by its votaries than curling. The ice of rank thaws before the sunny face of this game: priests, lawyers, country gentlemen, may be seen joining in it with the village shopkeeper and blacksmith—and this as no Young England novelty, but a matter of course that has been known in Scotland from all time, and seems likely to know no end. In fact, curling appears to have the power of bringing all men back to the common starting level of mere children; it fuses all hearts into one mass. And such bouncing and running, such sweeping and roaring—what shouts at great shots, what derision at failures! while the stones are every minute heard cracking against each other, filling the glen as with peals of thunder. Curlers, it may well be imagined, are all enthusiasts in their sports. The present writer met an elderly gentleman one morning on his way to a rink amidst the Braid Hills, near Edinburgh. 'Well,' said he, 'this is my sixtieth winter as a curler, for I first handled the stones in the '83.' Looking on, one day, at a match played upon that same rink, I observed a gentleman sink to the bottom of the pond with one leg. One of his partners was just throwing off his stone: it was a shot of deep importance. He had been for a few moments fixed in an attitude of absorbed attention. The accident to the leg was therefore unregarded till the fate

of the stone was decided at the upper end of the pond, when he deliberately pulled out his dripping limb as if nothing had been the matter. Such little traits will convey, even to the unfortunate denizens of mild climates, some faint idea of the glory and the joy (*tantus amor... atque gloria*) of curling.

The Annual of the Royal Caledonian Curling Club for 1845* makes us aware that that club is now the common tie or head of 120 local or district clubs throughout the country, numbering in all about 5000 members. We learn from it that curling has an evidenced antiquity of above two centuries, but is supposed to be of much older standing; and that there are local clubs which have had peculiar ceremonies of initiation, not much unlike those of free-masonry, from time immemorial. The rules of the central fraternity, and lists of the office-bearers of many of the local establishments, are given, together with accounts of matches and social meetings, and specimens of the original poetry produced on those occasions. The good-humoured enthusiasm of the volume is highly amusing. Mr Durham Weir, for instance, toasting 'Scotland's ain game of curling' at the dinner of the Royal club, January 23, 1844, delivers himself as follows:—'It is almost unnecessary for me to tell you, fellow-curlers, that of the various amusements that have attracted the attention of mankind, there is none of them worthy of being compared with that noble and manly recreation which has this evening been the happy means of assembling so many around these festive boards. Well may the game of curling be designated the Game of Games; for whilst it invigorates our bodies, it at the same time imparts a delightful and indescribable buoyancy to our spirits. In proof of this, I need only quote the authority of the poet Pennycuik, who flourished about a century and a half ago, and whose poetical effusions must speak to the heart of every true curler:—

To curl on the ice doth greatly please,
Being a manly exercise;
It clears the brain—stirs up the native heat—
And gives a gallant appetite for meat.

Of all scenes upon earth, fellow-curlers, there is none more interesting, none more fascinating, none more animating, than on a fine still frosty morning, when the sun is shining upon the snow-fleeced ice, the diamond-bespangled ground and the silver-tasselled trees, to behold groups of old Scotia's sturdy sons hastening to the field of contest—the glassy bosom of some sequestered glen or romantic lake—with their hearts beating high in the expectation of carrying away victory's well-contested palm.

Even aged men,
Smit with the eagerness of youth, are there;
While love of conquest lights their beamless eyes,
Few nerves their arms, and makes them young once more.

All are in motion; all are upon the tiptoe of expectation. See how they vie with each other in the friendly and exhilarating competition! Behold the keen glistening of their eyes while they survey the ponderous curling-stones as they go booming down the icy rinks. Curling not only enlivens our spirits and braces our nerves, but strengthens and enlarges the sphere of social intercourse, by bringing into contact many a kindred spirit who, but for such occasions as the present, would in all probability never have met on this side the grave. It is likewise the means of renewing friendships with

those whom we had almost forgotten, and with whom, in our thoughtless and giddy boyhood, we had spent many of our happiest days, "paddling in the burn, or running about the braes, pouting the gowans fine."

A short essay 'On the Moral Effects of Curling' digresses into a few remarks on those of a more tangible character. 'We have heard recorded, as amongst the rarest sights in nature, a dead donkey, and a tinker's funeral (we mean no offence by the illustration); but who ever heard of a sick curler? Let a man be wincing under the twitches of rheumatism, or roaring with the agonies of its superlative, gout, or pining under any of the nine hundred and ninety-nine maladies which prey upon the internal constitution.

Get stances and a broom, tak' a season o' curling,
And the pains o' disease in a giffy will flee.'

Amongst the social meetings recorded is one of a curious nature, which took place in the latter part of July, '44, on the top of the hills overlooking the Carse of Gowrie. The Fingask Curling Club there entertained their president, Sir Peter M. Threipland, Bart. as a mark of gratitude for his having prepared a pond for their amusement. The festivity took place in a gay pavilion perched on a spot seven hundred feet above the level of the sea, and from which the hills of a dozen surrounding and distant counties could be seen. The affair seems to have been one of those kindly conventions of gentlemen and commoners which have fortunately never been discontinued in Scotland, and which take place there, not under any notion of such meetings being desirable for ulterior objects, but simply because the rural people of all orders in that country feel, as they have ever felt, the most cordial dispositions towards each other. The facetious chairman of this occasion seems to have had a peculiar knack of turning everything to account in favour of the game. In toasting Prince Albert, for example, he alluded to a pair of curling stones which had been presented to him when at Scone palace in September 1842. 'The last time I heard of these stones,' said he, 'they formed a part of the valuable articles which adorn one of the galleries in Windsor palace. At that time some of the English nobility and gentry, on observing them, wondered greatly what they were, and expressed great anxiety to know what was the use of them. The palace at Windsor may, for anything I know, be a very good curling house, but I would ten times rather have heard of them being in a wee housie on the banks of the Serpentine, which would have shown that the prince was a chip of the right block, and a true son of the broom!' The Prince of Wales was thus adverted to: 'He has scarcely begun his education, but you will all agree with me in maintaining, that if, in the progress of that education, he is not made a "keen, keen curler"—if he is not thoroughly initiated into all the mysteries of that health-restoring, strength-renovating, nerve-bracing game of curling—his education will be entirely bungled.' Presenting the stones to the guest of the evening, he said, 'Let one of these stones be always placed on the tee, a perfect *pat lid*. The other, a few feet behind, a complete *guard*; at any rate, put them always over the *hog score*, and you may rest assured that, if there is broom or heather on the Sidlaw Hills, we will sweep them to the *tee-head*.' Finally came some jocundity respecting the propagandism of the game. 'The curlers are a set of the most benevolent fellows on the face of the earth—their benevolence is of a very diffusive description; and I am going to carry your benevolence across the wide Atlantic to our brethren in Canada, where you will find the

* Printed for the R. C. C. Club, by W. Forrester, 6 St Andrew Square, Edinburgh.

besom, and across the German Ocean, up to Petersburg, where you will find the channelstane. The Scotch games are beginning to spread far and wide over the face of the earth. The other week, when I was at Montrose, Davidson the club-maker was busy preparing to export golf-clubs and balls to the Mauritius, the Cape of Good Hope, and to Bombay. It is true that the noble game of curling cannot, in ordinary circumstances, be practised in these warmer regions; but last night I met with two young gentlemen who had the other day skated on artificial ice in Liverpool, which answered the purpose remarkably well. It seems that this artificial ice is composed of rosin and salts. From this a very good rink could be formed, and might be introduced into the East Indies with great effect. But should this be found not to answer the purpose, there is still another method by which curling might be enjoyed in that country. In the northern regions of India, our old friend John Frost possesses a large territory, and I am sure he would be delighted to afford some splendid rinks among the Himalaya mountains. The distance is trifling—only 1500 miles from Bombay. I hope we shall, by and by, see in the *Bengal Hurkaru*, or in some of the East India papers, a paragraph to the following effect:—"This morning a number of elephants, laden with curling stones, left Bombay for the Himalaya mountains, to which place a large party of Scottish gentlemen are to proceed for the purpose of enjoying for a few weeks their favourite game of curling." (Laughter and cheers.)

Enough of this good-natured nonsense, which we do not half understand even in point of language, exclaims some testy southern. By no means—you must first listen to, and endeavour if possible to comprehend, Walter Watson of Chryston's song on curling:—

'When snell o'er our snaw tappet mountains,
The breath o' the north takes a flight,
And seals up our lochs and our fountains
Wi' something like magical sleight,
Syne on the clear surface we venture,
WT a' our equipments in tune,
To join in the sports o' the Winter,
Wi' skates and weel tacketed shoon.
Brods and crampets and a',
Stanes and besoms and a',
How social the sport, and how manly,
Wi' stanes and besoms and a'.

Our forehead now ready for action,
Is metin' the lead wi' his e'e,
And hearin' his usual direction,
Has clappit his hand on his knee.
Stand back at the hog wi' a besom,
Scoop, scoop, for the ice is but new;
He's back, but we'll hae to excuse him,
We ken what our leader can do.

Leadin' and drawin' and a',
Guardin' and strikin' and a',
How social the sport, &c.

Our watchfu' opponents in motion,
Direct to draw up by a side;
Ye'll come to my cove, I've a notion—
Keep close, for ye mauna flee wide.
Weel done, sir—up hands—he's a' roarin'—
It's lost if it passes the ring;
That shot's rather strong for a forehead,
Yet no very far frae the thing—

Scoopin' and scrapin' and a',
Shakin' o' besoms and a',
How social the sport, &c.

Now, stane after stane in rotation,
Ilk wishin' to do as he's bid,
Till some in the brough get a station,
And ane's termed a vera pat lid.
Now, John, do you see a' the winner,
If no, tak' this wick at my cove;
Then til't he comes roarin' like thunner,
And spreads them like sheep on a knowe—

This way and that way and a',
Out o' the ring and awa',
How social the sport, &c.

Fine ports hae been entered and blocket,
Guid stanes hae been laid on ilk side;
Yet though we've been equally yoket,
Now vict'ry maun come and decide.

Our kinshad unrivalled at drawin',
Bands up a tee-shot to a hair—
Game, game, wi' loud cheers and huzzain',
While beams play saugh in the air!
Thankin' and roosting and a',
Fowlin' o' bottles and a',
Then hey for a beef and green dinner,
Wi' jaws o' guid toddle and a'.

SHORT NOTES ON THE WEST INDIES.

BY A LATE RESIDENT.

FIFTH AND LAST ARTICLE.

Style and Cost of Living.—The style of living of the upper classes in the West Indies differs, I think, not so much from that of the middle classes in England as is generally supposed. Made dishes and soups are certainly more frequent, and wine and spirits are more used. Otherwise, with the exception of the addition of colonial vegetables and fruits, I have found no difference. Roast and boiled beef, roast and boiled mutton (very often goat mutton), poultry, fish, &c. are all as generally eaten in the West Indies, although a like degree of justice is certainly not done to them, as in England. Many dainties are procurable in the colonies not to be had in England; on the other hand, many delicacies are to be had in England which are not procurable in the colonies. The variety in fish is endless, and many of them are much esteemed. The calapaver, the mountain mullet, the June or Jew fish, and the mud fish, are among those which are found most delicious. Turtle, being no rarity, is very little prized, and is about the cheapest dish that can be procured. Ortolans, commonly called 'pinkies' from their cry, are, in season (about October), much sought after. A great many kinds of beans and peas are to be met with, which are converted into delicious soups, although not introduced at table on set occasions. Alongside the far-famed 'pepper-pot,' which is very delicious, there is used at family dinners a sort of paste termed 'moosean,' which is not masticated, but gulped, lest it should adhere to the teeth and gums. Few like the process at first, but it becomes by no means unpleasant after a little practice. Rice boiled dry is a very common dish, and is among the class of provisions termed 'bread-kind.' Among vegetables, the yams, plantains, cocoas, ackies, avocado pears, chochos, &c. are exclusively colonial. Oysters, crabs, lobsters, crayfish, shrimp, &c. are to be had as in England—the two first, however, of a smaller, and, it is thought, of a more delicate description. Among the fruits, the shaddock, pine apple, orange, forbidden fruit, star apple, nesberry, and Grenadella, rank the first. A mixture of the star apple and orange is excellent, and not unlike strawberries and cream. The preserves are well known. Confectionary is by no means equal to what may be procured in England. Among the lower classes is found an interminable variety of 'country pots,' which it would be impossible to give a fair idea of on paper.

Proceeding downwards to the lower classes, it is possible that living is with them much less expensive than with the same grade in England. The agricultural population raise nearly all the provisions and vegetables brought to market. They may therefore procure them at little cost. They do not, however, live solely on such provisions. Salted pork, salted cod, herrings, shad, and mackerel, form chief ingredients of their daily fare, and these, although not dearer, are not cheaper than food in England.

Without reference to the expense of 'living,' there are items which render the 'keeping up of appearance'

in the colonies much more costly than in England. Few persons of any pretensions to respectability deny themselves the pleasure of keeping an equipage, or a horse, which brings other incidental expenses. In fact, so general is the practice of keeping a horse, that a labourer who toils every day in the week in the fields may be seen riding on Sunday to prayers. Nay, more; the bankrupt, probably for the tenth time, will, a day after the declaration of his insolvency, be seen as usual in his carriage. One observation must be made in behalf of those who keep vehicles or horses they may fairly call their own. The heat of the climate renders it a necessary rather than a luxury of life, and it is about the only rational resource they have by way of recreation or change from the monotonous life which is generally led in the colonies.

Hospitality and Benevolence.—I would consider any series of observations on the West Indies as incomplete which did not include a few remarks on the benevolence of the several classes; and as I have observed no particular connexion in my notes, the remarks which I have to make under this head may as well be inserted here as elsewhere. To whatever cause it may be owing—whether to the genial nature of the climate, which warms the heart as well as the body, or any other—it is no doubt true that the inhabitants of the West Indies are an hospitable and benevolent set of persons. Introductions to parties there are not mere matters of form, as they are, generally speaking, in England. The stranger at once finds himself treated as an old friend, and no little attention is omitted which seems calculated to render his stay, whether for a short or for a long period, comfortable. He receives more invitations than he can conveniently accept; the equipages of his new acquaintances are at his command; and the chances are, that, if his introductions are good, and he intends remaining in the West Indies, a road to a comfortable livelihood, if not a competence, is at once opened to his industry. The item of benevolence may perhaps best be elucidated by the circumstance, that a case of starvation, arising from positive inability to obtain food, is unknown. It is not to be denied that in the West Indies hospitality and benevolence frequently lapse into abuse; that is, the hospitality becomes lavish profusion, and the benevolence weakness. Of the evils of want and profusion, or niggardliness and indiscriminateness, however, I would choose in either case the latter—it being better that man should have in abundance than be in need.

Kindness and attention to the sick is also a marked feature of the West Indian character, particularly that of the female; and the middle class of coloured women are known as the most skilful and considerate nurses in the world. Their knowledge of the several diseases of the climate frequently surpasses that of the medical man, and the latter is not too proud to acknowledge, or too opinionated to take advantage of it. If the stranger be attacked by fever, by all means let him obtain the services of one of these nurses. Their presence is really very nearly a pledge of recovery, while their charges are reasonable, and as often as not they make no charge. Children's nurses are also a most affectionate set; and the attachment they entertain for the infants whom they have tended is to be broken only by death. I have 'a case in point.' On leaving the West Indies, an old black woman, whom I had not seen for many years, but whom I knew as the nurse of a person that had left some time back for England, came to me, and requested that if I saw her 'young massa,' I would tell him 'how d'ye,' and say that she often thought of him. I promised to do so; but am sorry to say that I forgot to perform my promise, although the opportunity to do so has often been afforded me.

A Governor's Ball.—The governor being the representative of majesty, a ball given by that functionary

answers of course to the drawing-room of her majesty in England, and the one occasions in a small way as much excitement as the other. For days before the invitations are issued, a fever of anxiety prevails to ascertain who are to be the invited parties; and as the invitations are sent through the post-office, we must suppose the clerks of that establishment have the benefit of the first cooling draught which is administered, they having the opportunity of first gratifying their curiosity. The whole island has, however, no sooner been quieted on this point, than another excitement ensues. The governor has issued invitations of very questionable propriety in the eyes of would-be lords and lady patronesses, who accordingly feel for the time seriously afflicted. Mantuamakers and milliners, haberdashers and merchant tailors, are ere this in requisition. Prices are given which, strange to say, are never received, and bills run up that are never suffered to run down. Ladies and gentlemen are, however, finally equipped, and at length the happy moment approaches. The carriages are in waiting, the clock probably strikes ten, in jump the parties, smack go the whips, and away the vehicles roll to government house. A line of the rabble occupies each available position near the building; but the immediate vicinity of the representative of majesty, wonderment at the scene, and the police, awe them into quiet. The carriages approach the door with no obstruction or delay beyond that of the driver's overshooting the steps, and the parties emerge. 'Your names,' inquires a footman in waiting: they are furnished, and straight resound through the hall of introduction or hall-room, according as the host may have placed himself. If in the hall-room, the ceremony of introduction or obeisance is probably for the moment postponed; for to edge one's way at once through the dense concourse of persons who have quickly assembled to the upper end of the room, where perhaps the governor and his lady—should he have one—sit enthroned on a dais, is a work of some difficulty. The parties who have arrived late, therefore, either take seats on the couches and chairs arranged throughout the apartment, or fall into the quadrilles, if they can succeed in squeezing out places for themselves, partners, and *vis-à-vis*. The quadrilles over, the sets proceed *en promenade* round the room, making their obeisances to the representative of majesty (and spouse, if in being, and present), as they pass the spot occupied by them. This is the moment for such introductions as are yet to be made. He, however, who has no friend at court, must be content to introduce himself, or humbly worship at a distance in the revolving crowd. Popular governors make it a point of traversing the room occasionally, for the purpose of shaking the hand of every guest. The other, however, being the most dignified, is, I believe, the most usual practice. After this the band (usually a military one) probably strikes up a waltz, whereupon the floor is cleared, and away start off a dozen couples whirling round the room like double-pegged tops, and chasing each other as though the object were to be first at the end of the circle. The windows are all thrown open, and a pleasant current of air enters the apartment; but waltzing is warm work, and pearly drops now follow each other down the dancers' cheeks. At length the band becomes fatigued (the waltzers never are), and the music ceases. The ladies then cast themselves listlessly on couches, and the gentlemen agitate their partners' fans, bestowing on themselves as great a share of the reviving current of air produced as decency will permit. In a few minutes they are all ready for the next quadrille. A circular promenade had been formed at the termination of the waltz by the lookers-on, but with the sound of the music it is converted into large quadrille sets, and dancing again commences. This, with an occasional visit to the refreshment tables—where gentlemen consume large quantities of 'sangaree' and 'mixed hock,' while ladies modestly imbibe 'iced lemonade' and 'capillaire'—is the routine until supper time. When that hour arrives, the host leads one of his most dis-

tinguished guests—probably the chief-justice's lady, or the lady of the president of the council—to the table in another apartment, and is followed by as many couples as can obtain places. Probably the ladies are all accommodated, and the good things gradually disappear. At length the governor's health is proposed and drank with nine times nine, and his excellency returns thanks in a most gracious speech; he then retires, as do the ladies, with a sprinkling of gentlemen: most of the latter remain to do yet greater justice to the hospitality of the host, in which they seldom fail. After this period many ludicrous, if not indecorous occurrences transpire. Among the former, I recollect the case of a gallant colonel of militia, who, discovering that he was unable to reach with dignity or safety beyond the middle of the stairs leading from the supper to the ball-room, very judiciously sat himself down. The ladies tittered, and the gentlemen laughed; but the colonel's friends coming to his assistance, he was speedily marched off the field, like many a gallant veteran, in a worse plight than when he entered it. With the disappearance of supper, little of interest remains for the elder portion of the guests. These therefore shortly after depart, while the younger portion keep up the dance until his excellency rises to retire. This is the signal for all to take their leave and disperse, which they do, wondering whether his excellency will give another entertainment shortly, or whether those who have enjoyed his hospitality on the present occasion will subscribe and give his excellency a ball in return, that being the mode in which parties are usually reciprocated.

State of Society.—Enough has been said in the course of these notes to lead the reader to conclude that society in the West Indies has not as yet assumed its most attractive garb, although in a very advanced stage of improvement. Whatever might have been its condition previous to the era of slavery, we have sufficient evidence for believing that that degrading system speedily engulfed, in its horrid and vicious practices, such humanising influences as had existed. By and by, however, as the communication with the mother country became more frequent, a ray of light would, as it were, intrude itself into the darkness, showing the desolation which prevailed. Young 'creoles,' sent home for their education, would return bringing 'more light.' A better infusion from Europe, too, would prevail; representations of the state of the colonies would induce missionaries to go out, for the purpose of communicating instruction to the people; and the several sparks of improvement thus elicited, once permitted to ignite, soon spread into a flame, which began, and has continued to consume the wide-spreading branches of the moral upas tree which overshadowed every corner of colonial society. To continue the simile, although probably at the expense of my narrative, the old tree, though not yet dead, has been so scorched as to leave us certain that it will never again shoot out vigorous branches; and we may now entertain every reasonable hope that the colonies will by and by present a happy illustration of the effects of moral contact and instruction. This event, however, is still in perspective, as has been said. A contempt for the matrimonial rite, taking so prominent a stand in the history of the colonies, though greatly lessened, has not yet ceased; and what is technically called 'hard living' among certain classes, has diminished, but still often occurs. Education among the lower orders advances probably with as great strides as it has ever done in any country where it has been but recently introduced; and attendance on public worship among all classes is more general, if not more sincere, than it once was.

The Press.—The press is as influential in the colonies as in other quarters of the globe. But as until late years its voice was never elevated in the defence of liberty, and it dared not, for the sake of its own existence, paint vice in the nakedness of its deformity, we must conclude its influence was rather for evil than for good. When it assumed the censorship of morals, and advo-

cated the equal rights of all classes, its influence was evidently of a beneficial kind, although much evil attended its practices in detail. In order to hold up vice to public reprobation, it was necessary to describe its most hidden features; hence arose a necessity for laying bare the private affairs of individuals. In order to further the interests of freedom, it was necessary to decry those who upheld slavery; hence attacks on individual character. Thus, while slavery lasted, the colonial press was a repertory for all that was scandalous and libellous; the one party resorting to this use of it as a means—though it cannot be denied as an evil one—of obtaining a good end; the other, by way of retaliation, and support of a favourite but falling system. There was, however, a portion of the colonial press which with the new order of things at once put on a new aspect; and the cause for which it had battled having been gained, threw down its ancient weapons of war, appearing as a mediator between the two parties who seemed disposed still to carry on the contest; the one on the ground that the labourer, though free, required protection; the other on the plea that the planter had been ruined through the instrumentality of their opponents, and also required an advocate. This moderate set of papers has succeeded in lulling the resentment which prejudices and causes of dispute had occasioned, and bringing the colonies nearer to that period when complete union will prevail. I have reason to believe that the effort which enabled the conductors of this portion of the press to pursue the course which they did was great. Popular influence was before them, and a community of injuries goaded them on; but a paramount sense of public duty prevailed over personal considerations, and good has been the result. With respect to the scurrility and party spirit of the colonial press, it may be as well to observe that they were at one period so great, as to induce the government at home to direct that no editor of a newspaper in the colonies should be included in a new magisterial commission. This was certainly an interference with the freedom of public discussion which nothing but a great exigency could warrant. The restriction has, however, now been removed.

The Future.—We cannot penetrate into futurity, and therefore are not in a situation to predict the destiny of the colonies. We may, however, point out what appears necessary to be attained, and what to be avoided, ere that destiny can possibly be a happy one. Passing over the two items—want of labour and deficient agriculture—we may point to capital as a great desideratum in the colonies. I have been told of cases where the labourer would have at least six weeks' wages due him, and have heard of others where tickets are presented him in payment of labour—such tickets to be redeemed at some future time. These are not incentives to industry in older free countries than the colonies, and cannot prove so in the latter. Economy in every department is another requisite. By way of commencing at the fountain-head: there seems no reason why the office of attorney should not be abolished; the overseer, who is now often also attorney, being competent to the discharge of the duties of the estate. Absenteeism must also be modified. If proprietors cannot make it convenient to reside in the colonies, at least let them rent their properties to parties who can. The aid of government must be obtained in creating for the colonies an interest in the bosoms of those who are destined to spend their lives there—that is to say, offices of emolument must not be confined, as hitherto, to the *protégés* of government supporters at home, but distributed among the deserving in the colonies. These are amongst the chief desiderata. Among the items to be avoided, are a distrust of or contempt for the natural labourers of the colonies—of the labourers who, though coerced to it, made the colonies what they were and are. It cannot be expected that they will labour cheerfully for those who mistrust or despise them. They must also be regarded as entitled to as much consideration and as much

pay as imported labourers. He will feel that an unjust distinction is made when additional 'comforts' are given to the latter which are denied him. Lastly, there must be union among all classes; for we are told, on the highest authority, that 'a house divided against itself shall not stand.'

RECREATIONS WITH THE MAGNIFYING MIRROR.

A SKETCH FOR YOUNG PEOPLE.

EVEN the sunniest days of summer are like life's pleasures—not always to be calculated upon. We had proposed for to-day a visit to the woodlands to study nature in the fields and open air; but the morning lowered, and to a dense drizzling fog succeeded a continued rain, which steeped everything in moisture. There is no time that one feels a disappointment from the weather more than in the long and bright days of summer, and especially when some out-door excursion is in view. The young people felt it much, and looking out upon the green shrubbery, every leaf of which was now weighed down with the dripping moisture, and on the prostrate roses with compressed and soiled petals, and then, giving many an anxious gaze up to the dense and sombre heavens, they could not help contrasting the sunny smiles of yesterday, and their out-of-door gambols, with the dreary solitude of this.

Under these circumstances, other amusement was to be sought for within doors; so, making some arrangements beforehand with the magnifying mirror, the young people were called in. 'Look here, Henry, and as your observations are generally pretty accurate, tell us what you see.' 'I see a green park with shrubbery; in the distance a handsome lodge, and in the foreground several trunks of trees lying about as if newly felled.' After a short pause—'Oh! I see on one of the prostrate trees a creature, a beautiful animal. I declare it moves; it climbs up over the fallen trunk, and now it stands on the upper side of it. How beautiful and majestic it looks! It has a dark-brown or olive body, with numerous fair yellow spots, a finely-shaped neck, small head, two horns, and soft and beautiful eyes. It moves again; it must be alive: it stalks along like a deer, or the pictures we have seen of a chamois. Tell me, is it really a living animal or a deception?' 'It is indeed,' said I, 'a living creature.' 'I thought so,' replied Henry, 'for its movements could not be but those of life and nature. How slender and elegant is its make—its limbs how pliant, and adapted for quick and easy motion! It now moves again down the sloping trunk of the tree, and along the side of another.' 'It was Anna's turn to view it next. 'I do see the creature, but it is half concealed among the branches: nothing now is seen but its beautiful head with its slender tapering horns and soft intelligent eyes. It is gone; I wish it would appear again. Oh! here comes from the other side another, and another, and another. What beautiful creatures! They move on with all the calmness and majesty of tame roes: they stand, look round, move their horns, and then wheel off, succeeded by others. Oh! here is a little one, a young creature, of a bright yellow, with a body so transparent that you may almost see through it.' Elizabeth, who had given place to the younger children, now had her curiosity raised. She now viewed the mimic scene, peopled with really living creatures, with some amazement. 'They are indeed like a troop of deer,' she says; 'but this is impossible, and let me see, they have six feet instead of four.' 'Six feet!' cried Henry, somewhat piqued at his failing to observe this; 'are you sure of that? let me look again.' It was found that they had six feet, and, therefore, that they could not be quadrupeds. I then inquired what class of animals had six feet, and they all answered me, 'Insects generally.' They were, however, loath all at once to bring down their fine troop of deer, or, at the least, chamois, to insects; but as the investigation of

truth should at all times be made the paramount object, the mimic show was dissolved, and the trunks of trees in the foreground proved to be some slips of our favourite myrtle, which I had discovered to be infested with the *aphis*, or plant louse. While reading near the window, one of these animals crawled across my book, and I was so struck with the beauty and elegance of its form, that after ascertaining from whence it came, and that it had left there numerous companions, I resolved on showing it on a magnified scale; and, by arranging a coloured landscape of a park and trees in the way mentioned, I succeeded in inducing in the children the association of deer in a park.

Our attention was now directed to the myrtle, and to its stock of living inhabitants, which it had, unfortunately for its health and vigour, acquired. The question now was, where had these insects come from? The myrtle had hitherto been perfectly free from them, and as the species of *aphis* appeared to be that generally found on the willow, I conjectured that the colony had come from the willows on the outskirts of the shrubbery. But how could they come from such a distance, over walls and through hedgerows? How? what is to hinder an animal which you compared to a deer from bounding over all these obstacles? But look here, some of these insects are winged, while others, and the great majority, are wingless. This is a singular difference in animals of exactly the same species: but so it is; some are furnished with wings, in order that they may flee away and produce new colonies, while the remainder, creeping along from plant to plant, leave none in their neighbourhood untenanted. They are perhaps the most numerous of all insects, and the most prolific. One parent will bring forth from ninety to a hundred young; in five or six weeks as many generations will have sprung from each of these ninety, so that, in the course of a short season, not less than six thousand millions will have sprung from a single parent. You see these clusters of minute brown spots on the under side of the leaf? these are the eggs from which young will be hatched in a few days. Towards the close of the season, eggs are always produced and deposited in crevices of the green bark; these eggs endure the cold of winter, and insure a brood in spring, thus affording a careful provision by which nature secures the preservation of the species.

'And what part of the plant do these animals feed on?' inquired Elizabeth. 'They extract the juice by a proboscis, the end of which pierces the leaf or tender stem. If you gently turn up one of these myrtle leaves, you will find a group of the insects on the under side, and with this glass we shall probably see some of them feeding. They are always found on the under side of the leaf, and thus are protected from the weather and from their enemies.' 'Here,' cries Henry, 'is one busy at work; I see his proboscis distinctly; it is not unlike that of the elephant.' 'And here is another on this side,' said Elizabeth, 'just unfolding its proboscis, and we shall watch it piercing the leaf. How quickly and easily is this operation performed. But do they not injure the leaves by this process?' 'Very much,' I replied: 'you see how many of the leaves of yon myrtle are curled up and shrivelled and sickly from the operations of these creatures; in a very short time the whole plant would suffer from the abstraction of its due nourishment. In this way these animals are very destructive to all plants on which they settle, and especially to tender and succulent ones, which they prefer. You see, too, on many of the leaves a clammy whitish fluid; this is what is called honey dew; in reality a kind of sugar or honey which drops from the animal, and is the refuse of its digestion. This is what gives the clammy feel to the stems and leaves of many plants, which you have often remarked, and which is found covering them, as the beech and hop, like a hoar frost. Some have supposed that this dew exuded or sweated from the pores of the plant itself, from the state of the weather, but there can be no doubt that it is caused by the *aphis*, for it is only found on those parts of the plant

where they are domiciled. Other insects are very fond of, and feed on this honey dew, and it is much more common in some seasons than in others—those years of blight, which, by repressing and retarding the vigorous growth of plants, favour the propagation of the aphid.

'You make me displeased with the aphid now, which I formerly admired,' said Elizabeth; 'how shall we rid our dear myrtle of these pests?' 'The rascally vermin!' cries Henry; 'we shall utterly exterminate them, not only from the myrtle, but from the willows and the garden too.' 'Moderate your wrath a little, my dears,' I said; 'they have enemies enough, as you shall presently hear; besides, they perform their parts in the great chain of existence, and would be as much missed by many hungry stomachs, as our sheep or our poultry would be by us.' 'Let us hear of some of their enemies,' they all exclaimed. 'In the first place, they are preyed upon incessantly by many of the larger flies, which pounce upon them, and suck up all the juices of their bodies. Among these is the ichneumon fly—a brown fly with a long piercer attached to its body, which I have formerly shown you. This fly pitches upon a poor aphid, pierces its little body, and then deposits its egg in the hole which it has made. In a few days the egg becomes a little grub, having such a voracious appetite that it soon devours every particle of the creature into whose body it had been so curiously inserted, except its skin, when, piercing a hole in this, it creeps out, and leaves the dry skin hanging on the leaf like a drop of dew. Myriads of them fall in this manner. And the well-known insect, the lady-bird you have often seen creeping among the bushes, many a dinner does it make on a fattened aphid. But they have more enemies still. You see that blue tom-tit there busy among the leafy bushes; even in this rainy day he must have his dinner. See how he perches with his back downwards, and picks, picks incessantly at the backs of the leaves; every pick indicates the death of an aphid: not fewer are made than one hundred in the minute, so that in half an hour, for his share alone, he has bagged three thousand head. And no doubt many other species of the soft-billed birds are making similar dinners in various other corners.'

'I relent against the poor aphid,' cries Anna, 'and must again pity it: no wonder that they have fled from the willows and the cruel ichneumons, and have come to take shelter in our myrtle: we must not kill them: yet if they would only be content with cabbages, and not destroy our beautiful myrtle, I would feed them myself daily.' Here followed a sharp discussion on the propriety or impropriety of their destruction. Henry was firm in the determination that, as they had unlawfully entered the house, and taken possession of the plant, they should be exterminated without compunction. The others hesitated much, on the plea that the creatures were innocent, and had sought their protection; and proposed that the plant should be taken out into the lawn and washed with water till freed of them. I stated that this plan would be ineffectual, for water was found not to kill them, and the most minute washing would not eradicate them; that in all greenhouses, and other similar places where their rapid increase could not be checked by the operations of their lawful enemies, man had no hesitation in exterminating them by his art. I then explained the means by which I intended to preserve the myrtle from their further ravages, which was to place it within a large box, and apply over it the fumes of tobacco; this, or sprinkling the leaves with tobacco juice, being generally approved of as the best means of getting quit of such destructive creatures. I then turned to the pages of our favourite poet of 'The Seasons,' and desired Henry to read the passage referring to these insects.

'For oft, engendered by the hazy north,
Myriads on myriads, insect armies waft
Keen in the poisoned breeze, and wasteful eat,
Through buds and bark, into the blackened core
Their eager way. A feeble race! yet oft
The sacred sons of vengeance, on whose course
Corrosive famine waits, and kills the year.

To check this plague the skilful farmer shaft
And blasting straw before his orchard burns;
Till, all involved in smoke, the latent foe
From every cranny suffocated falls;
Or scatters o'er the blooms the pungent dust
Of pepper, fatal to the frosty tribe;
Or, when the envenomed leaf begins to curl,
With sprinkled water drowns them in their nest;
Nor, while they pick them up with busy bill,
The little trooping birds unwisely scarce.

'The author, you see, here describes concisely and elegantly what I have been telling you.'

'He is at fault, however,' said Henry, 'with regard to the remedy of water as a destroyer of them.'

'And he omits,' added Anna, 'all mention of the cruel ichneumon.'

'Still here, as indeed throughout his whole poem, he paints his sketches not only with the eye of a poet, but of an accurate naturalist.'

PERSECUTED POETS.

HAPPILY such a being as a persecuted poet has no existence in this country. No court censor yields his pen to score out, from his manuscript, a bard's finest thoughts, because they may, in the cold unsympathising opinion of the official, be construed by the public into something having a political tendency opposed to the powers that be.

But abroad—especially in Germany and Italy—the case is different: nothing can be done in imaginative art without the sanction of the government. To show how rigidly this rule is enforced, we may cite a curious instance of the small despotism which the heads of a great empire will sometimes exercise over half-a-dozen simple words. A few months since, a noble Florentine, Count Masetti, anxious to save it from the ravages of time and the vandalism of speculators, purchased the house, on the Lung' Arno, in which Alfieri lived and died, and placed over the gate, on a white marble slab, the following inscription:—'Vittorio Alfieri, Principe dell' Italiana Tragedia, per la gloria e regenerazione d' Italia qui detto e qui mori'—('Here Victor Alfieri, the Prince of Italian Tragedy, for the glory and regeneration of Italy wrote and died.') There was nothing very alarming in this monumental record; the local censorship gave its *visa*, and the prefect of police his *exequatur*. The inscription had been open to public view for several days, when, all at once, the Austrian chargé d'affaires at Florence took exception to it, in the name of his imperial master. At first it was naturally believed by the Tuscan government that he could not be serious; but despatches from Vienna came which fully proved that the chargé d'affaires perfectly represented the notions as well as the power of the Austrian emperor. Protest, lampoon, pasquinade, and epigram, were all in vain. The Florentine authorities were obliged to yield, and the inscription was removed in the name of Austria.

If, it will be asked, this sort of vigilance be exercised over mere poetical inscriptions, what must be its effect upon poets and poems themselves? The reply will appear in the few facts we are about to narrate. They do not, it is true, apply to Austria, but to other parts of Germany, where the jealousy of literary censorship is equally rigid and oppressive. So much so, that the youthful continental poet has to struggle not only against want of patronage and the other evils which unknown genius is heir to in every clime, but runs the risk—even when his fondest hopes are accomplished in finding his verses in print—of being punished for some perhaps accidental, perhaps designed eulogy on a forbidden subject—such, for instance, as 'freedom.' Many instances of this have occurred in Germany in former times, without exciting our especial wonder. But now, the spread of knowledge and a more ripened political experience would, one would think, diminish the number of persecuted poets. This, however, does not appear to be the case. Our readers may recollect an account,

in our twelfth volume, of the case of George Herwegh, who was banished from the Prussian dominions as an incorrigible votary of ideas inconsistent with the existing political system. In the last number of the Foreign Quarterly Review we find some interesting particulars respecting an equally able poet, and apparently more amiable man, Ferdinand Freiligrath, who has been recently banished for publishing a song we shall presently quote, and for translating Burns's noble ditty, 'A man's a man for a' that!' From the above source we learn that Ferdinand Freiligrath was born at Detmold, in Westphalia, where his father was a teacher in the burgher school, and early destined for the pursuit of commerce. He is said to have given proofs, even in childhood, of a poetic temperament, and, at the age of seven, to have delighted his father by the production of his first copy of verses. At an early age he was removed to the care of an uncle at Soest, in Munster. This relation, a man of simple means and liberal sentiments, allowed his poetic nephew to follow the bent of his inclinations. Much to the credit of Ferdinand, he took the best possible advantage of his uncle's kindness; for during the six years he remained with him, he acquired the English, French, and Italian languages. 'His mind,' says our authority, 'had already taken its decided bent, and not all the prosaic details of the wharf and the counting-house could smother the fire of genius within him: on the contrary, his vigorous imagination thrived well upon such food as would have killed a weaker one of indigestion. Invoices of sugar and whale-oil are not, perhaps, the sort of reading best fitted, in all instances, to nourish and develop the poetic faculty; but in every tub of oil Freiligrath had bodily before him the life of the hardy whaler, its perils, hardships, and bursts of intense joyous excitement; every cask of sugar spoke to him of tropic skies and tropic vegetation, of tornadoes and earthquakes, of pirates and slaves, and negroes toiling under the white man's lash, who, in their own wild land, had fought victoriously with the lion and rhinoceros for their spoils. The sights and sounds of the sea, which the great bulk of his countrymen know only by report, became for him visible and audible realities; he mingled with travellers and seafaring men, for his muse was not of that squeamish sort that "loves not the savour of tar and pitch;" and many a band of emigrants, from his own Germany, did he see departing for the new world, and he talked with them of the untried homes they were seeking, and of that dear land they were never again to visit but in dreams. Thus his mind accumulated a vast store of images, not isolated or partial, but concrete and entire; he could say of himself,

"My eyes make pictures when they're shut"—

pictures which he projected into his verses, glowing with the vivid colours of the most intense life.

His poems, which he began to publish in 1830, in various periodicals, were first issued in a collected form in 1838, and they have now, in six years, reached as many editions. In 1839, encouraged by the enthusiasm with which his first volume was received, Freiligrath withdrew from commercial pursuits. His means, which were probably not large, were increased, in 1842, by a small pension spontaneously bestowed on him by the king of Prussia. On New-Year's day 1844, however, Freiligrath thought it advisable to resign his pension, and shortly after published a poem, of which the following is a translation:—

'FREEDOM AND RIGHT.

O say not, believe not, the gloom of the grave
 Has ever lain closed upon Freedom's glad light,
 For that sealed are the lips of the honest and brave,
 And the scorers of baseness are robbed of their right.
 Though the true to their oaths into exile are driven,
 Or, weary of wrong, with their own hands have given
 Their blood to their jailers, their spirits to Heaven—
 Yet immortal is Freedom, immortal is Right.
 Freedom and Right!

Let us not be by partial defeats disconcerted;

They will make the grand triumph more signal and bright;
 Thus whetted, our zeal will be doubly exerted,
 And the cry be raised louder of Freedom and Right!
 For these two are one, and they mock all endeavour
 Of despots their holy alliance to sever;
 Where there's Right, be ye sure there are freemen, and ever
 Where freemen are found, will God prosper the right.
 Freedom and Right!

And let this thought, too, cheer us—more proudly defiant.

The twins never bore them in fight after fight,
 Never breathed forth a spirit more joyous and buoyant,
 Making heroes of dastards in nature's despite.
 Round the wide earth they're marching; their message they've
 spoken,
 And nations leap up at the heart-thrilling token;
 For the serf and the slave they have battled, and broken
 The fetters that hung upon black limbs and white.
 Freedom and Right!

And battle they still, where the voice of earth's sorrow

Tells of wrongs to avenge, of oppressors to smite;
 And, conquerors this day, or conquered to-morrow,
 Fear ye not, in the end they will conquer outright.
 Oh! to see the bright wreath round their victor brows shining,
 All the leaves that are dear to the nations combining,
 Erin's shamrock, the olive of Hellas entwining,
 With the oak-leaf, proud emblem of Germany's might.
 Freedom and Right!

There are sore aching bosoms and dim eyes of weepers

Will be gathered to rest ere that day see the light;
 But ye too will hallow the graves of the sleepers;
 O ye blast ones, we owe to them Freedom and Right!
 Fill your glasses meanwhile. To the hearts that were true, boys,
 To the cause that they loved when the storm fiercest blew, boys,
 Who had wrong for their portion, but won right for you, boys,
 Drink to them, to the Right, and to Freedom through Right!
 Freedom through Right!

These lines, and a translation of 'A man's a man for a' that,' which appeared about the same time, were absolutely prohibited, and as our readers would perhaps like to see a specimen of official criticism from the pen of a continental censor, we produce the following from the chief of the Upper Court of Censorship of Berlin:—
 'The fundamental notions from which both poems proceed are, in their clear and pure conception and application, perfectly true, and may even be uttered and extolled in a poetical form. But such a turn and import is given them in the said poems, that a provocative appeal is thereby made to the tendencies in conflict with the existing social and political order of things; the first poem, namely, addressing itself to false ideas of freedom, the second to the mutually hostile opposition of the several ranks of society; wherefore these poems are manifestly at variance with the principles of the censorship, as laid down in the fourth article of the Instructions.

The practical operation of these prohibitions is graphically described by a correspondent to the League newspaper. 'Standing,' he says, 'in a bookseller's shop (in Frankfurt), where I had called to inquire for a new work, I saw a man enter with a sheet of paper in his hand, which he handed to the bookseller. After reading part of its contents, the bookseller wrote his name in the paper, and returned it. He turned then to me, and said, smiling, "A notice from the magistracy that Freiligrath's new poems are prohibited, and liable to confiscation." "Why," replied I, "that would make a poet's fortune in England." "Here, too," said he, "the only person who is not dissatisfied with the order is the publisher." He then handed me the volume to look at. * * * The verses are good, and the expression conceived in such general terms, that none but a Prussian, or some one well versed in the domestic policy of Germany, would think of applying them to Berlin. The most explicit piece the book contains is a translation of Campbell's "Ode to the Germans," in comparison with which the others are gentle complaints. Freiligrath has a remarkable tact in translating from the English, and has even been able to give his countrymen a taste of the beauties of Burns. In the preface, he declares his envy of the land in which it was possible to publish "A man's a man for a' that," without every verse being applied to Alnwick, Apsley House, or Buckingham

Palace, and the authors being thus brought into conflict with the pillars of the state. Burns would assuredly, in Germany, have been exchequered, instead of sharing, even in a humble capacity, the profit of the excise office; and his danger would have been of course the greater in a land where the state professes to have but one pillar, which will not bear shaking.

Before Freiligrath could venture to publish any more poems, he was compelled to put himself out of the reach of the royal censor, and now resides in exile at Brussels.

The above account of Freiligrath, with the translated poem, is from the last number of the *Foreign Quarterly Review*, a work now of long standing, and which we are happy to see kept up with unabated spirit. There is perhaps no department of intellectual culture more neglected in England than the study of continental literature.

POLYTECHNIC SOCIETY OF NEWCASTLE.

An institution called the 'Tyne Polytechnic Society' was established in the above town in the early part of September last. There were a Literary and Philosophical Society, a Natural History Society, and a Mechanics' Institution, previously in existence; but the terms of the Literary and Philosophical Society (two guineas per year) are too high for the limited income of the majority of the working classes. The Mechanics' Institution has hitherto confined its funds to the formation of a library and purchasing philosophical apparatus; and all classes which have been established under its auspices have been charged extra to the students attending them. A branch of the Government School of Design is also established at Newcastle, and affords an excellent opportunity for instruction in the art of design, as applied to manufactures. But there was still something wanted to complete the education of the great majority of the artisans in that populous and important town. Impressed with this idea, a few individuals met at a private house, and resolved to establish a society for the purpose of affording mutual instruction in the several departments of science, until their funds should allow of payment to lecturers. And such has been the success of the measure, that, in the short space of four months, upwards of eighty members have joined the society, and numbers are daily being admitted. Classes for the study of mathematics, chemistry, English grammar, the French language, and drawing, are now in active operation; and others for the Latin language, elocution, music, and modelling, will be added as soon as the necessary arrangements for their establishment are completed. The pupils already number amongst their teachers professional men, who have handsomely offered their services gratuitously. They have purchased furniture for the room, and also the requisite books, out of the quarterly subscriptions (3s. per quarter above the age of eighteen years, and 1s. 6d. below that age); aided only by a donation from the mayor of the town, A. L. Potter, Esq. It is intended to form a library of scientific works; but the books will not be allowed to circulate, the want of success of the classes attached to some Mechanics' Institutions having been traced to the inducement afforded by their libraries for members to remain at home, instead of attending the classes. The committee of the society take in rotation the duty of attending every week, and thus save the salary of an attendant or librarian. We have entered somewhat minutely into detail, for the purpose of showing the advantages likely to result from the formation of similar institutions in other towns. So far as this institution has been carried on, no expense whatever has been incurred for the teachers of the various classes. Ultimately, however, it is the intention of the members to engage feed teachers and lecturers when their finances will permit.

WOMAN'S MISSION.

As the vine which has long twined its graceful foliage about the oak, and been lifted by it in sunshine, will, when the hardy plant is rifted by the thunderbolt, cling around it with its carressing tendrils, and bind up its shattered boughs, so is it beautifully ordered by Providence that woman, who is the mere dependant and ornament of man in his happier hours, should be his stay and solace when

smitten with sudden calamity—winding herself into the rugged recesses of his nature, tenderly supporting the drooping head, and binding up the broken heart.—*Washington Irving.*

WE ARE GROWING OLD.

We are growing old—how the thought will rise
When a glance is backward cast
On some long remembered spot that lies
In the silence of the past:
It may be the shrine of our early vows,
Or the tomb of early tears;
But it seems like a far-off isle to us,
In the stormy sea of years.
Oh, wide and wild are the waves that part
Our steps from its greenness now,
And we miss the joy of many a heart,
And the light of many a brow;
For deep o'er many a stately bark
Have the whelming billows rolled,
That steered with us from that early mark—
Oh, friends, we are growing old.

Old in the dimness and the dust
Of our daily toils and cares,
Old in the wrecks of love and trust
Which our burdened memory bears.
Each form may wear to the passing gaze
The bloom of life's freshness yet,
And beams may brighten our latter days,
Which the morning never met.
But oh the changes we have seen,
In the far and winding way;
The graves in our path that have grown green,
And the locks that have grown gray!
The winters still on our own may spare
The sable or the gold;
But we saw their snows upon brighter hair—
And, friends, we are growing old.

We have gained the world's cold wisdom now,
We have learned to pause and fear;
But where are the living founts whose flow
Was a joy of heart to hear?
We have won the wealth of many a clime,
And the lore of many a page;
But where is the hope that saw in time
But its boundless heritage?
Will it come again when the violet wakes,
And the woods their youth renew?
We have stood in the light of sunny brakes,
Where the bloom was deep and blue;
And our souls might joy in the spring-time then,
But the joy was faint and cold,
For it ne'er could give us the youth again
Of hearts that are growing old.

Stranorlar.

FRANCES BROWNE.

THE KAMPTULICON.

Such is the name given to a new life-boat invented and constructed by the Elastic Pavement Company of London, whose applications of caoutchouc to a number of economical purposes we noticed in No. 33 of our present series. The 'Kamptulicon,' so called from the elastic nature of its materials, is composed principally of cork and India-rubber, the gunwale, keel, seats, and fittings, being of wood. She is 34 feet long and 12 feet wide, and is 4 feet deep in the midships from gunwale to keel; she is fitted with four victualling-boxes, and ten air-boxes, covering an area of about 19 feet by 10 feet, which may be fitted up at will either with air or water—with air, of course, when increased buoyancy is required, and with water when extra ballast is wanted. She is capable of holding about fifty persons; and though an open boat, with no sails or rigging of any description, little doubt is entertained of her capability to live in the roughest sea, the specific gravity of the material of which she is composed being so small, that she would not sink if full of water. She weighs about two tons, and draws fifteen inches of water when her crew and passengers are on board.

* * * Complete sets of the Journal, First Series, in twelve volumes, and also odd numbers to complete sets, may be had from the publishers or their agents. A Stamped Edition issued for transmission, post free, price Two-pence halfpenny.

Printed by William Boddury, of No. 6, York Place, and Frederick Mullett Evans, of No. 7, Church Row, both of St. Peter's Newington, in the county of Middlesex, printers, at their office, Lombard Street, in the parishes of Whitechapel, and St. Andrew's, London, and at the office of the Proprietors, W. & R. CHAMBERS, at No. 2, ABNEY CORNER, in the parish of Christ Church, and in the City of London.—*Shewing, February 25, 1865.*

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 61. NEW SERIES.

SATURDAY, MARCH 1, 1845.

PRICE 1½d.

SEVENTEEN FORTY-FIVE AND EIGHTEEN FORTY-FIVE.

The arrival of the year forty-five in this century has produced a slight sensation—in Scotland particularly—over and above what the commencement of a new year generally occasions. We are all set a-thinking of that former forty-five in which such a remarkable series of domestic occurrences took place, deciding the fate of a dynasty with which an obsolete system of government and of faith was connected, and determining the current of public affairs and of social progress into a channel which it has never since left. We also recollect the extraordinary character of the transactions of the last forty-five, so highly calculated to take hold of the imagination and feelings; a piece of mediæval romance, as it were, which had by chance wandered into the age of whiggery and hoop-petticoats; sounding, amidst hosts of the commonplaces by which we are still surrounded, the expiring trumpet notes of chivalry. That great round in the markings of time, a century—impressive because it is just the first grand period which living man must all but despair of seeing accomplished in his own life—has now been completed since a disinherited prince, tartanned, tarred, pedestrian, but an Apollo of youthful grace and natural dignity, trailed his cloud of self-devoted Highlanders through Lowland Scotland and Central England, to regain the crown of a hundred ancestors (the faith made it a reality), or die in the attempt. How much was there concentrated in that strange pageant!—divine right breaking its head in madness against the impregnable walls of popular privileges—the Celt, in his dress and arms older than Romulus or Pericles, perishing in a last attack upon the overwhelming force of the higher-endowed Goth—generous feelings, eagerness to redress what were thought personal wrongs, unselfish worship of an ancient idea almost identified with religion, meeting a murderous rebuke from the cannon-mouth and the scaffold, and, in the inexorable sternness of human contentings, ridiculed as folly and condemned as crime! Since all this happened, a hundred years have passed, and laid everything but a memory beneath the sod. 'It will be all the same a hundred years hence,' some rustic philosopher might have said at the time, as he heard the shouts of strife and the wailings of wo; and behold those hundred years have passed, and it is the same in the sense he meant it. We are only a few historical chapters the richer.

But the recurrence of a 'forty-five' is not to awaken these romantic associations alone. We are also called upon as a nation to reflect with grateful feelings upon the progress which has been made by our country since the last of our civil wars, showing, as the retrospect powerfully does, the benefits which flow from intestine

peace. The England, and still more particularly the Scotland, of 1745, how different from those of 1845! Hardly in any one particular is there not an improvement; while, taking the whole together, and considering it either by itself absolutely or relatively towards other states, an advance of a most remarkable nature is apparent. In that time Great Britain has acquired India, and planted far more colonies than are required to make up for the few New England states of 1745, which she has since lost. She has bound Ireland to her in incorporating union, making a United Kingdom, which probably contains not less than three times the population which existed on the same space in 1745. The national debt of 1745 has indeed increased from fifty, to be now not less than eight hundred millions; a somewhat alarming fact at first sight; and yet it cannot be doubted, considering the relative population and wealth, that the debt of a hundred years ago was a heavier burden than that of the present day. David Hume prophesied that when the national obligations came to a hundred millions, England must be ruined; but that sum has been multiplied by eight without insolvency, and no one would now expect that an advance to a thousand millions would be fatal to our national fortunes. The annual expenditure is now somewhat above the whole amount of the debt in 1745—a fact which may be partly to be deplored; but does it not indicate also a vast increase in the national resources? Since 1745, the productive powers of the soil, especially in the northern section of the island, have been more than doubled, in consequence of improved methods of agriculture and husbandry; but the improvement in this respect is small compared with that which has taken place in other branches of industry. The cotton manufacture has been created since 1745, and all the other great manufactures have been prodigiously increased. The shipping of the country has gone on in equal paces. See the best exponents of these facts in the rise of Manchester, Liverpool, Leeds, Birmingham, Glasgow, from the small towns which they were in 1745 to what they now are. Liverpool was not so important a town in 1745 as to have a newspaper. Manchester had only one. There were but twenty-eight in all provincial England, two in Scotland, and four in Ireland (in the two last cases, confined to the respective capitals). London was then a town of under half a million of population—about one and a half of the present Manchester. Edinburgh had forty, and Glasgow twenty thousand: now the latter is computed to have 311,000. Lancashire has since then added just about one million to her population! The whole annual revenue of the country from customs in 1745 (about a million and a half) was not a third of what is now drawn on that account in Liverpool port alone. The entire annual revenue of the empire during the reign of George II. (about eight millions on the average of thirty-three

years), is now considerably exceeded by the amount of customs received in the port of London. Since 1745, England and Scotland have been overspread with canals and railways, immensely facilitating the transit of merchandise. Enormous sums have also been spent on the construction of roads; and the principal public buildings of the three kingdoms have been reared in that time.

The advance has been much greater in North than in South Britain; and indeed we might affirm, with little chance of contradiction, that no country out of America has made a greater progress within the last century, or ever in one century made a greater progress, than Scotland has done in that time. In 1745, this ancient kingdom, at the distance of forty years, had not forgotten an unpopular union. There was a large party, including a considerable proportion of the gentry, decidedly disaffected to the reigning family. Some old sores, such as the Glencoe massacre and Darien expedition, still rankled in the Scottish bosom. Thus the spirit of the nation was distracted. It was impossible, in such circumstances, that there could be any hearty application to courses of industry, or to enterprises promising general advantage. But when the claims of the Stuarts were finally quelled on Culloden moor, a new era seemed to commence, and from that time the pursuits of peace acquired a decided ascendancy. Scottish historians usually conclude their narratives in 1707, saying that after that time their country has no history: a most surprising blunder indeed; the fact being, that our history before that period is merely curious and romantic—hardly in any degree instructive—while the subsequent period would possess for the political philosopher the highest value. A history of the country from that time to the present would be the history of human energies applied to their best purposes, and achieving the most admirable results. Most interesting is it, truly, to see this little nation, with their sterile mountains and moors, and only patches of good land between, setting themselves to overcome all difficulties, and, by dint of pure mental force—a perseverance which knows no tire, a sagacity hardly ever at a loss, ingenuity not to be baffled, prudence never to be lulled asleep—working out what we now see, a land made blithe with plough and harrow, firths whitened with merchant fleets, streams persuaded, since they are making falls at any rate, to fall for the benefit of huge mills planted upon their banks, and splendid cities rising where once there were only little towns. The agriculture of Scotland was, in 1745, but the agriculture of cotters, embracing not one mode calculated to favour the powers of simple nature. Now its farming is an economical and scientific application of principles; not yet what it may be, but in the meantime a notable example to all other portions of the empire. Manufactures worthy of the name did not exist in 1745. Look now to the busy banks of the Clyde and Tay, not to speak of many other minor scenes of industry. In 1839, there were 676 ‘factories’ in Scotland. Of the commerce of the country in 1745, we have an idea from the fact that Leith, the principal port, then had shipping under two thousand aggregate tonnage. The amount in 1840 was 19,954 tons. At Dundee, the writer of these pages played at whist two years ago with a hale elderly gentleman, who said he had once farmed the shore dues of that port at £300: they had reached, in 1839, the large sum of sixteen thousand pounds! This town has risen from a population of 5302 in 1746, to 62,794 in 1841. A story is told that the mail bag from London arrived one day in Edinburgh, a short time after the year 1745, with one letter, being a missive addressed to the British Linen Company. It is hardly necessary to remark how huge the mail bags now are each day. The revenue of Scotland was at the Union £110,694; in 1788, it was £1,099,148: that collected last year was above five millions, being about what the revenue of the whole state was in the reign of George I. It may also be mentioned that the Scottish coin, when called in at the Union, was found to amount to little more

than eight hundred thousand pounds. An old lady worth exactly *double that sum of money* died in Edinburgh about three years ago! There is perhaps nothing which more emphatically marks the national progress than the history of its banks. Of these establishments, there were two on the joint-stock principle in Edinburgh in 1745, and one private establishment in Glasgow; none at Aberdeen, Dundee, Perth, or any other town. The Bank of Scotland had, it seems, tried a branch at Aberdeen, but it failed to obtain sufficient business to make it worth while, and the money was quickly withdrawn, being brought, it is said, to Edinburgh on the backs of horses, the only mode of carriage which was then practised. At the present time, there are twenty-three joint-stock banks in Scotland, having three hundred and thirty branch establishments. The aggregate capital employed by the two Edinburgh banks in 1745 was £200,000: that now employed in joint-stock banks somewhat exceeds eleven millions. And here it may safely be remarked, that no banking concerns in the world have ever been managed with better success than those of Scotland—a fact mainly attributable to the caution which forms so conspicuous a feature of the national character. There has not been, within the memory of the living generation, a declaration of insolvency from more than four banks, and three of these were comparatively small provincial concerns; and the public, as distinguished from the shareholders, did not lose one farthing by them.

The progress of the capital forms a good criterion of that of the country, and no city assuredly could well show a greater change in a century than Edinburgh has done during that time. This city was, in 1745, one of 40,000 inhabitants—antique and inconvenient in structure, and pent up within walls capable of being defended against an enemy unprovided with artillery. The accommodations possessed by families of good figure were generally limited to three or four rooms, not more than one of which would be unprovided with a bed. Of the middle ranks, most lived in bedrooms. Arrangements now deemed indispensable for cleanliness and delicacy were unknown. There was much homely comfort, but little elegance. It is entirely since 1767 that Edinburgh has burst from the limits of the Old Town, and spread herself in matchless beauty over the adjacent fields. Now we see the streets, which are devoted to the domestic accommodation of the middle and upper ranks, almost uniformly elegant, and houses occupied by shopkeepers which a judge or a landed gentleman could not have obtained eighty years ago. And the whole habits of life of these parties are equally improved. It is common to hear old people praising the easy good-humoured life of their young days; but it was in reality full of inconveniences, which either must have been constantly giving vexation, or were overlooked solely because of the low state of mind of those exposed to them. We learn from Sir Walter Scott’s memoirs, that his parents lost all their children in infancy while they lived in the Old Town, and that he only escaped by being sent to the country. Another literary man born in Edinburgh, Mr Kerr, editor of a well-known collection of voyages and travels, was the eighth or tenth child of his parents. All his predecessors had perished in consequence of the narrowness of the domestic accommodations, and his preservation was owing to the same cause as Scott’s. Can we wonder at such results when we learn that Mr Bruce of Kennet, a gentleman of estate, who, being in the law, became a judge of the supreme court, occupied with his family, about the beginning of the reign of George III., a house of one floor, rented at fifteen pounds, and containing three rooms, one of which was employed partly as his study, and partly as a bedroom for his children? When we know such things, we can hardly be surprised at Mr Creech telling us, about 1790, that a French teacher left, for want of accommodation, the house which thirty years before sufficed for Lord Drummore. There cannot be a doubt that, built as Edinburgh now is, many a man of

income exempt from property-tax is lodged better than men of rank and fortune were in 1745.

Since that period, the changes in the moral and intellectual character of the people, in their manners, customs, and language, have been equally great. Farmers then sat at the same table with their servants. It looks an amiable custom; but the sole cause was, that the farmers had no education or taste superior to their servants, and were in reality labouring people themselves. Gentlemen and ladies spoke broad Scotch; the former swore a good deal; the latter snuffed. Their meetings were rare, and without refinement. Female accomplishments, by which such a charm is now given to home, were then unknown. Few women could even write a letter; fewer still spell one correctly. The savagery still surviving in the national mind, even in cities, is shown strikingly in the execution of *Lynch law* upon Captain Porteous in 1736. The bigotry is shown in the Catholic riots of thirty years later. We have to go back but twenty-three years from 1745, to come to the last burning of a witch in Scotland. Then the state of public sentiment respecting the natural liberty and dignity of man, what an idea do we get of it from such facts as this—that, in 1755, while a press was going on for the Seven Years' War, a man who had been committed to the guard-house in Edinburgh 'for swearing,' was sent on board the tender, and, though earnest petitions were presented to the Court of Session to procure his liberation, the lords refused to interfere—or this, that, on the 30th of August 1766, the Edinburgh Courant advertised a female negro slave for sale. At the latter fact we need hardly be surprised, when we recollect that, for thirty years after 1745, the whole class of colliers and salters in Scotland were bondmen. We hear more now of the miseries among the humbler classes than our forefathers did in 1745; but this is not to prove that miseries were then unknown in that class. Groan as the poor might formerly, their voice was never heard; no inquiry was ever made into their condition. In the very fact of the groans being now heard, and their causes zealously sought for with a view to redress, it might be argued that we see something in favour of the present time. The spirit of the Scottish representatives of the former period was most abject. Their gross servility to the minister of the day was perhaps what mainly depreciated the national character in the eyes of the English, and produced the satires of Foote and Churchill. In reality, they were not a representation of the people of Scotland; but this our southern neighbours had no reason to suppose. Now, the Scottish members are fully as independent as any equal number taken at random out of the parliamentary lists; and, if we are not much misinformed, their election is conducted with an exception from corrupting influences which is not paralleled in any other part of the United Kingdom. That the Scottish people, amidst all their changes, have not to any degree lost the peculiar religious spirit which distinguished them of old, recent events have fully shown. On a subject of some delicacy, it is not necessary to say more; but what is said is much.

Upon the whole, it appears to us that the British empire has made an advance in all the prime elements of greatness during the last hundred years, such as cannot be found paralleled on the same scale in any history. If we look into the past, we nowhere see such a bound forward made by any country; so that we may fairly say that here is a new exemplification of the power of a naturally well-endowed race to advance in national greatness when circumstances of a greatly unfavourable kind, such as war, are not allowed a strong operation. It is very clear that no person living in 1645, and looking abroad upon his past and present, could have seen grounds for supposing that a century later was to commence such a period as we now see closing. Does not that period argue a degree of national improbability to which it might be difficult to set limits? Does it not show that, if no worse catastrophe than has

marked the past century shall mark the future career of this empire, the condition at which it shall have arrived in 1945, in physical and moral greatness, must be something of which we would vainly at present endeavour to imagine the particulars? Why, this great and still increasing London may in 1945 be a town of eight millions of inhabitants—a phenomenon which the world has not heretofore witnessed. A vast amount of the waste and barbarous parts of the earth—perhaps all Asia, excepting that belonging to Russia—shall have then yielded to a British sway, and begun to adopt the manners, language, and moral ideas of this people. To how many of the distresses of the sons of earth will remedies have then been applied! How many great questions in physical science and ethics will then have been solved! How sweetly will the wheels of the social machine, as well as the current of individual life, then move! Alas, why have we been condemned to live in the early part of this darkling century, streaked but with the dawns of so much glory! How envious those who shall be born unto our children's children!

CHECK-MATED—A TALE.

'Oh yes, revenge is pleasing, let moralists contend as they will,' said a young man whom we will name Mackisson, while in conversation with another. 'Nay more, there is something of ecstacy in the pleasure which we feel when we have it in our power to repay with interest the injury or insult which we have undergone.'

'Say not so, Mackisson,' replied the other, whom we will call Vincent; 'the pleasure is rather that of a demon exulting in his own bad passions, than of a human being possessed of rational and moral qualities. My creed is that of our celebrated philosopher Bacon. "In taking revenge," he remarks, "a man is but even with his enemy, but in passing it over, he is superior." Again, "That which is past and gone is irrecoverable, and wise men have enough to do with things present and to come; therefore they do but trifle with themselves that labour in past matters."'

'Mere theory, I assure you, if not something bordering on hypocrisy,' retorted the other. 'Bacon himself was not celebrated for too strict an adherence to the principles which he taught.'

'Some of those principles, however,' replied Vincent, 'among which I number that respecting revenge, are of themselves immortal and incontrovertible.'

'Nonsense; why should we not avenge the injury we have received?'

'One reason is, that we gain no ultimate good; on the contrary, we insure to ourselves evil.'

'I should like much to hear how you make that out.'

'Willingly. Society is so constituted, that we can never be said to be independent of each other. If we revenge every injury, whether intentional or not, which we receive, we place ourselves without the pale of sympathy or assistance, when probably we stand most in need of it.'

'That would apply equally to the original offence.'

'Which would not weaken its application to the revenge.'

'But then the pleasure of making our adversary feel something of the pain that we have felt!'

'If pleasure there be, it is of too diabolical a kind to be taken into the account.'

'Then you would permit your enemy, and one who had deeply aggrieved you, to go scatheless?'

'I would.'

'So would not I; and there ends the matter. Good-bye.'

Such was the conversation of the two young men on the occasion of this interview; and little did they think how soon they would be led each to put his principles into practice.

Their principles being diametrically opposed, it is not surprising that their dispositions were equally so. Mackisson was conceited, passionate, ambitious, and

vain; consequently jealous. Vincent modest, good-tempered, yet reserved; unobtrusive, yet firm. The one was affected by every trifling occurrence; the other thought few occurrences were of sufficient importance to be permitted to disturb the equanimity of his temper. Mackisson was aspiring, but not always observant of the proper means; Vincent was not indifferent to distinction, but thought it procured at too great a price if at the sacrifice of honour.

It is not an easy task to explain the precise degree of estimation in which each was held in the circles in which they moved. Mackisson, always accessible, easily led to enter into the spirit of every passing event or topic of conversation, not deficient in humour, seemed a general favourite, and was usually surrounded by a host of persons. Vincent, modest and retiring, not easily led to attach importance to that which seemed to him not worthy of consideration, not always conversable, yet able to take no mean part in conversation when moved to do so, seemed at times neglected when in the company of his more brilliant associate. There was, however, always this distinction between the small circle which sought his conversation, and that large one which thronged around his companion—the one was remarkable for its frivolity and boisterous hilarity, the other for its quiet yet cheerful gravity. An occasional intermingling would of course take place between these circles; but soon again the members of each would, by a sort of antagonism, resume their former places; like two uncombining fluids which, agitated, will assume a temporary intermixture of parts, yet resort each to its original state as soon as the external force which caused them to intermingle is withdrawn.

Between the parties themselves there had long existed an acquaintance; but the probability of a perfect intimacy had become daily lessened as the force of their natural characters developed itself. Mackisson thought Vincent too 'soft,' as he would term it; and Vincent thought Mackisson too boisterous and assuming. The one would prolong a debate after every point had been conceded; the other detested useless discussion. The one would wrangle for a straw's end; the other rather abandon the straw *in toto*. Yet were they no equal match in force and strength of intellect, as Mackisson's wounded vanity was frequently compelled to admit.

Discussions similar to that just narrated, and ending similarly in favour of Vincent, were not calculated to narrow the natural antipathy, if I may so term it, of their characters. In fact, at every fresh defeat—and the occasions were many, for Mackisson's vanity and ambition led him to enter upon every discussion, however unacquainted with the subject—the extent of that antipathy became greater; and as Mackisson's principles fairly developed themselves, Vincent saw the necessity of having as little in common with his companion as possible. Matters were in this state when another discussion, attended with the mortifying circumstance of publicity, gave a fresh impetus to this mutually opposing principle. Mackisson and Vincent were present on an occasion in which an argument arose on the subject of party spirit, and its effects on society. As usual, Mackisson took a prominent part, and, addressing himself frequently to Vincent, ultimately involved him in the discussion. As it became warm, however, the latter proposed that it should cease, there being no necessity for permitting it to proceed to the extent which it promised to do.

'I'll allow it to cease,' said Mackisson, 'if you admit yourself vanquished?'

'By no means,' replied the other; 'yet I am no longer disposed to continue the argument.' Those, however, who entertained opinions similar to Vincent's, and had in a degree abandoned their cause to his advocacy, were not desirous that the discussion should terminate in so unsatisfactory a manner. At their solicitations, then, he again replied to the positions which had been assumed by Mackisson, and the argument approached a climax. 'You say,' continued Vincent, 'that party spirit is bene-

ficial to society, by reason of the force which it engenders, and that that force being in a right direction, good must result. How if it be in a wrong?'

'We must prevent it from being so.'

'How will you prevent it?'

'By inculcating correct opinions.'

'But does not the existence of party spirit imply the existence of two factions at least?'

'It does.'

'Well, then, can both of them be in the right?'

'Certainly not.'

'Can it be for the good of society that any body of men should be in the wrong?'

'Of course not.'

'And yet *this* is party spirit!' A laugh from his opponents, Vincent's supporters, annoyed Mackisson exceedingly; and already at a loss, he floundered on in the discussion.

'No, no, you do not understand me,' he continued, after a short but embarrassing pause. 'I do not intend that any body of men should entertain erroneous opinions. I would have all mankind advocating correct principles.'

'Well, then, suppose they were?'

'If they were, we should have the benefit of their united force tending in the right direction.'

'Where, then, would be the party spirit for which you contend? If all were unanimous in advocating correct principles, how could party spirit possibly exist? and if good resulted from this unanimity, how would you charge it as the result of that spirit?'

'Vanquished, by all that's good,' exclaimed Vincent's supporters. 'Mackisson, go hide your diminished head.'

'I will not—I am not conquered—I will not be conquered by him,' cried Mackisson, much excited.

'Oh, good, good!' echoed the others.

'A man convinced against his will,

Is of the same opinion still—'

but every one knows he has lost the game.'

'I tell you I've not,' he replied, stamping his feet on the ground, 'and I'll prove it out of that fellow's own text-book.' Vincent reddened at the term, but remained calm.

'He pins his faith,' continued Mackisson, 'on every word that falls from the pen of that old speculator Bacon. Now, Bacon himself says, that "it is good to side one's self to a faction." The misapplication of this quotation was so glaring, that it was followed by a simultaneous burst of laughter, at which Mackisson, unable to control his anger, or to bear the point of their sarcasms, abruptly left the room.

Here, as elsewhere, the vast superiority of temper over passion was amply manifest. Vincent, as I have already observed, was not a general favourite; but the mode in which he had conducted himself throughout the discussion, won considerably upon the esteem of his companions. Above all, the moderation under provocation which he had shown, far from detracting from the good opinion, tended rather to enhance it. Thus forbearance usually receive its due homage, although it may not at all times be enabled to emulate it.

Mackisson, on the other hand, lost much of the good opinion of his own supporters; and, the victim of a soul which he himself had tended to create, retired to his home possessed of the most outrageous feelings of jealousy—of all passions the most permanent and the most corroding. Anger may evaporate with the passing of the occasion which induces it, hatred may give way to a sense of the unworthiness of its object, but jealousy ever nourishes and prolongs the cause which excites it, and the very self-esteem which, in the case of hate, contributes to allay the passion, here, by a depreciative comparison, perpetuates it. Had Mackisson been simply angry, a few hours would have sufficed to allay the feeling; but being also jealous, we find him days subsequently nourishing his resentment, and seeking to avenge himself in a manner peculiarly characteristic.

Inferiority, and the publicity which had accompanied the last manifestation of it, were the causes of Mackisson's jealousy. It therefore became his object to lessen its degree in any possible shape, accompanied with equal publicity. How, he reflected, could that object be attained? All contest with Vincent in debate or general acquirement, he was reluctantly compelled to admit, was vain. Vincent was too far in advance, and too industrious himself, to permit a fair chance of speedy equality. Would games of skill effect the object? It seemed unlikely. Vincent was no admirer of, and seldom played them. Little credit was therefore to be procured by excelling him at them. But there was one game, superior to them all, confessedly a game of mind, of which Vincent was devotedly fond, and at which he possessed the reputation of being an expert player. Was it possible to contend with him at this game—to vanquish him with his own weapons? Oh what triumph for him, Mackisson! what humiliation for his opponent if it were! And it should be possible! Nights and days would be devote to all the intricacies of the game, to all the mysteries of the several moves; and then, when he had rendered himself master of them, then he would challenge and conquer his opponent, under circumstances that should obliterate the memory of all past discomfitures.

Mackisson had energy and perseverance, and some talent, although of a second grade. To resolve to prosecute the study of the game, was to do so. Every spare moment was devoted to it—all mere pleasure sacrificed to it. Every move was patiently investigated, and a variety of combinations committed to heart over and over again; and then, when he thought himself sufficiently proficient, he requested Vincent to pass an evening with him, transmitting at the same time invitations to all their mutual acquaintances to be there. Vincent went, and found to his surprise many persons assembled. The feeling, however, soon wore off. Mackisson was unusually gay, and somewhat marked in his attentions to Vincent. The latter, regarding this conduct as the result of a desire to atone for the occurrence of the last meeting, responded with cordiality. At length Mackisson proposed to Vincent that they should play a game of chess. 'I suppose,' he added, 'there is very little probability of my being conqueror, having but within the last few weeks acquired a knowledge of the game.' The truth at once occurred to Vincent; Mackisson had learned the game to compete with him, and the guests had been assembled to witness what he undoubtedly expected would be his triumph. 'Mackisson,' observed Vincent, giving utterance to his suspicions, 'I perceive this is a preconcocted challenge?' 'I candidly confess it,' said Mackisson, 'and these gentlemen will bear witness of my intention to win back the many laurels I have lost.' 'A challenge, a challenge!' cried the guests; 'let's have the game; fire to one on Mackisson; four to one on Vincent.' &c. 'I accept the challenge,' replied Vincent, inwardly determined, if possible, to atone for that restless vanity on the part of his companion, which was continually engaging himself and others in hostile contests.

Vincent played white, and Mackisson red, and for some time the game was maintained with equal skill. At length Vincent made what Mackisson regarded as an exceedingly bad move. 'Your game is gone,' he cried exultingly to Vincent. 'Say you so?' replied the other; 'we shall see.' 'I am magnanimous enough to inform you,' continued Mackisson, 'that unless you use exceeding skill, the game is mine.' 'Well, then, if you will be so positive,' said Vincent, 'let me in my turn inform you that you shall be check-mated in my four next moves.' 'Pooh, pooh!' exclaimed Mackisson, 'you dream: I've moved; 'tis your turn to play.' 'Well, then, check to your king with my castle.' 'Ha, ha! a most awkward blunder—I take your castle with my king.' 'Be it so; check with my other castle.' 'Well, I move out of check; that makes two moves.' 'Check with my castle again.' 'Ha, ha, ha! really, this is too

good; I take your castle once more with my king.' 'So you do, but I check-mate you with my queen!' 'Tis false!' exclaimed Mackisson—'tis false! I'm not check-mated!' and then, a moment after, seeing that the game was lost, he swore a terrible oath, and flung the board and men to the extreme end of the apartment. There was an end to the hilarity of the remainder of the evening, and the guests soon after separated.

From simple jealousy, Mackisson's feeling towards Vincent was now converted into hatred. The pit which he had dug for another he had fallen into himself, and he now regarded that other with the bitterest feelings of animosity. No means were left unexplored which he thought could injure—no devices untried which appeared calculated to wreak his revenge. One of the most important attempts of this nature occurred but a few weeks subsequent to the date of the scene just described.

'Do you know young Vincent?' inquired a gentleman at the house of a third party, on an occasion when Mackisson was present. 'Very slightly,' they replied; 'what of him?' 'Nothing of moment,' rejoined the inquirer; 'but I have some reason for learning the character he bears.' 'By the by,' observed one of the company, 'Mackisson may be in a situation to afford you the necessary information: apply to him.' The party addressed himself to Mackisson. 'I know Vincent well,' replied the latter; 'very well indeed.' 'Let me hear something of him.' 'Why, he is as good as the generality of us; but—' and he made a significant pause. 'Pray, go on,' urged the other, who seemed much interested. 'The fact is,' added Mackisson, appearing suddenly to recollect himself, 'I should not like to report anything to Vincent's discredit.' 'Discredit!' ejaculated the other, 'I have been led to believe him a very exemplary young man.' 'I make use of the term discredit,' continued Mackisson; 'but I perceive I have already said too much.' 'For heaven's sake explain yourself!' exclaimed the party; 'I am free to confess to you that Vincent is much interested in the result of my inquiries respecting him.' 'Then is it the more necessary that I should hold my peace,' said Mackisson. To further solicitation, he replied, 'I beg to assure you, sir, that I *know* (with much emphasis on the word) nothing calculated to affect our good opinions of Vincent's character.' 'Can you not tell me something of this young man which may dissipate these doubts?' said the inquirer, addressing himself generally to those present. 'We know nothing of him,' they replied, 'except that he is very reserved, and is not a general favourite.' One other attempt did the party make to obtain some explicit information from Mackisson, but the reply added the more to his perplexity. 'It does not become me,' said Mackisson, 'to repeat that which might, after all, be but the result of unfounded suspicions.' Mackisson was aware that a vague allegation oftentimes more surely blights the character of an individual than any definite charge. The mind has in the former case the entire circle of offences through which to wander: in the latter, but a solitary segment of the circle.

We should not understand Mackisson's character aright, were we to suppose that he avoided the society of Vincent while thus calumniating him. On the contrary, he sought his presence, and manifested an apparent deference and respect towards him which he had never before exhibited. It is the part of low and revengeful cunning to wear the mask of friendship, that it may the more securely wound.

Vincent had returned home one evening from his day's occupation, when a letter left for him during his absence was placed in his hands. Its contents were calculated greatly to surprise him. A distant relative, possessed of considerable wealth, had died, leaving him his heir; and the letter requested that Vincent would,

* The curious may see a game played in this manner in the Illustrated London News of 4th January 1845.

at his earliest convenience, favour the writer with an interview. Vincent, therefore, immediately repaired to the address of the party (an attorney), from whom he learned all the particulars of his good fortune. There is but one portion of the conversation held on the occasion to which it is necessary to refer. 'You see, my dear sir,' said the attorney, 'what friends we have in the world. Had I placed implicit confidence in the character furnished me of you by your friend, you never would have inherited the splendid fortune now at your command.' 'This is not the only favour of the kind which I have to place to his account, as he shall some day know,' said Vincent: and having made certain arrangements with the attorney, he returned home.

Our hero was now, like all his prototypes, in possession of a large income; and although generally as retiring and reserved as heretofore, he was admitted to be, by some species of magic perfectly familiar to men of the world, a very fine fellow. His entertainments were not sufficiently frequent; but there was something so chaste about those which he gave, that every allowance was to be made. His conversation was not racy, but then his wine was of the first vintage; and so on. It was evident that Vincent, wealthy and independent, was a much more important personage, and had far more extensive privileges allowed him, than Vincent, a clerk and dependent.

Well, at one of these chaste entertainments given by our hero were assembled many guests, among whom were Mackisson and other acquaintances of early days. The cloth had been removed, and wine brought on. During a temporary cessation in the conversation, Vincent remarked, addressing himself to his guests, 'By the by, gentlemen, let me tell you, I have recently discovered so atrocious a combination of hypocrisy, malice, and ingratitude, that I am assured, when I relate to you the circumstances, and name the party, known to you all, you will unanimously eject him from your society.' 'Who is he? who is he?' echoed from all sides; and Mackisson's voice was heard among the loudest, although he experienced a feeling amounting to suffocation. 'I'll name him presently,' and then producing some papers, Vincent continued—'this individual and I have been on terms of intimacy from our earliest years, and never on one occasion, I am assured, have I given him just cause for an angry feeling. Of me he has always exhibited a degree of jealousy that was unaccountable; but I have ever striven to allay it. He has insulted me, but I have passed by his insults unnoticed. He has endeavoured to blight my character and to wreck my fortune, but I have forgiven it all. On a particular occasion, he had so planned as to render me, but for a happy chance, the ridicule of our mutual friends; but I fortunately escaped the toils he had set for me. From that moment his every sentiment has seemed ingulfed in one of revenge, and he has resorted to every device which he thought calculated to effect my ruin. The more adroitly, however, to veil his schemes, he professed a reviving attachment to me. While he secretly undermined, or attempted to undermine, my reputation, he openly exhibited his apparent friendship; while he stealthily sought to mar my prospects, he outwardly courted my society; while he strove to wreck my happiness, he seemed only anxious to promote it.' A pause enabled the guests to express in the strongest terms the unpardonable ignominy of such conduct. Mackisson's situation may be conceived, but not expressed. Vincent continued—'I do not, gentlemen, speak unadvisedly, or without authority. The fortune I now possess had been lost, had his report of my character been received. I can produce an attorney on whose credulity he played successfully for a time. My hopes of domestic felicity were basely threatened. Here is a letter infamously maligning my conduct to a lady whom I have the honour to esteem, and which letter I am enabled to trace as emanating from his hands. He has carried his hostility and his envenomed feelings, for aught I know, up to this very

moment of time; for here is another letter dated to-day, addressed to one of my most intimate friends, scandalously, yet secretly as he imagined, misrepresenting circumstances which transpired between us.' Vincent again paused, and glancing his eyes slowly around the table, permitted them to rest fixedly for a moment, but only for a moment, on Mackisson. The latter was exceedingly pale. 'What think you, gentlemen,' he again continued, 'should be the punishment of such a wretch?' 'It is impossible to suggest one too ignominious,' observed a guest. 'He should be scourged beyond the limits of respectable society,' said another. 'He should be publicly whipped,' cried a third. Mackisson's agony was intense as he contemplated the probable accumulation of all this wrath on his own head. 'Name him!' shouted a fourth. He started. This indeed was what he dreaded: this indeed would be the acmé of shame and humiliation. To be pointed at as a hypocrite, an ingrate, a liar! Oh how bitterly he repented having given way to an unprincipled jealousy and a feeling of malicious revenge! He would have given much to have crept out silently and unobserved. The overwhelming sentences of social excommunication would then pass over comparatively unheeded. But escape was impossible. One faint hope presented itself. Would Vincent relent? Oh no! there was no compassion in that indignant voice—no mercy in that determined look. 'Name him!' shouted the voice; 'name him!' (Mackisson felt a sickening sensation at heart; his brain reeled)—name him, that we may brand him as an unprincipled wretch and base defamer.' 'I will not name him,' said Vincent calmly; 'he knows the obloquy which he has incurred, and will appreciate my present forbearance and forgiveness.' Mackisson at that moment felt that he could die to serve the man whom he had hitherto bent every energy to embarrass and defame.

The following morning he addressed a penitential letter to Vincent, acknowledging the unworthy nature of his conduct, and pledging himself ever to remember Vincent's forbearance with gratitude. It is pleasing to remark that he added, 'I can now appreciate the divine nature of forgiveness, and the consequent diabolical character of revenge. Had you pursued the course which I should have done, you would have rendered my hatred implacable. You forgave me, and have awakened my esteem. I hope hereafter to prove to you my affection.'

THE JOURNAL OF A NEGRO PROPRIETOR.

MATTHEW GREGORY LEWIS—whose 'Journal of a West India Proprietor' has been lately republished in Murray's Colonial Library*—was, during the beginning of the present century, a shining literary star, especially amongst the higher circles of society. Indeed he was the fashionable author of the day; but though his fame was extensive while he lived, of such an ephemeral and indeed objectionable cast were some of his writings, that it would in all probability have died with him, had he not left behind the above journal, one of the most graphic and amusing specimens of its class in the English language. The father of Lewis was, at the time of his birth, in 1775, the deputy-secretary at war, and otherwise a man of large fortune, which was derived chiefly from two extensive sugar estates in Jamaica. Matthew was put through the routine of education common to the sons of opulent parents—Westminster school, Oxford, and the usual continental tour. On his return to England, after the production of his first novel, he found himself courted by the highest circles; than which nothing could have been more agreeable to his taste; for his leading foible was a love of great people. 'He had always dukes and duchesses in his mouth,' remarks Sir Walter Scott in a note appended to Byron's

* Under the title of 'M. G. Lewis's Negro Life in the West Indies.'

Diary,* 'and was pathetically fond of any one that had a title.' In corroboration of this, Byron, in his *Detached Thoughts*, relates that at Ostlands Lewis 'was observed one morning to have his eyes red, and his air sentimental. Being asked why; he replied, that when people said anything kind to him, it affected him deeply, "and just now the Duchess (of York) has said something so kind to me, that—" here tears began to flow. "Never mind, Lewis," said Colonel Armstrong to him; "never mind—don't cry—she could not mean it."

In 1802 Matthew Lewis succeeded the celebrated author of 'Vathek,' and owner of Fonthill Abbey (Mr Beckford), as M. P. for Hindon, in Wiltshire; but only sat in parliament during one session, determined to devote himself in future to literary pursuits. Not only his fame, but his range of noble and fashionable acquaintanceships was enlarged by his dramatic, or rather melo-dramatic productions; the most popular of which were 'The Castle Spectre,' 'The Bravo of Venice,' 'The Captive,' 'Blue Beard,' and 'Timour the Tartar.' In 1815 his father died, and left him the sole command of a large fortune, in which the two Jamaica estates were included. Amidst all the foibles which are inseparable from a petted author, and a haunter of the nobility's saloons, Matthew Lewis had always shown himself a man of the warmest benevolence. At that time the horrors of negro slavery were constantly depicted both in and out of parliament by the abolitionists, with Wilberforce at their head. Lewis had now become a proprietor of slaves, and although in the zenith of his popularity, the associate of princes, and the proudest names of rank and genius of which this country could boast, he determined to leave all the luxuries and allurements of the sort of existence he best loved, to make perhaps a perilous, certainly an uncomfortable voyage to his estates in Jamaica.

We are now prepared to open the journal of Lewis's experiences of 'negro life in the West Indies.' On the 11th of November 1815, he started from Gravesend in the good ship 'Sir Godfrey Webster;' and, after a stormy voyage, some of the incidents of which he describes with the most felicitous humour, the ship 'squeezed herself into the champagne bottle of a bay,' formed by the estuary of Black river. On New-Year's day 1816, he arrived at Savannah-la-Mar, and he was met by the 'trustee' or agent of his estates, who conducted him to that called Cornwall. His enthusiastic reception at this property he thus describes:—"As soon as the carriage entered my gates, the uproar and confusion which ensued sets all description at defiance. The works were instantly all abandoned: everything that had life came flocking to the house from all quarters; and not only the men, and the women, and the children, but, "by a bland assimilation," the hogs, and the dogs, and the geese, and the fowls, and the turkeys, all came harrying along by instinct, to see what could possibly be the matter, and seemed to be afraid of arriving too late. Whether the pleasure of the negroes was sincere, may be doubted, but certainly it was the loudest that I ever witnessed; they all talked together, sang, danced, shouted, and, in the violence of their gesticulations, tumbled over each other, and rolled about upon the ground. Twenty voices at once inquired after uncles, and aunts, and grandfathers, and great-grandmothers of mine, who had been buried long before I was in existence, and whom, I verily believe, most of them only knew by tradition. One woman held up her little naked black child to me, grinning from ear to ear—"Look massa, look here! him nice lilly neger for massa!" Another complained—"So long since none come see we, massa; good massa come at last." As for the old people, they were all in one and the same story—now they had lived once to see massa, they were ready for dying to-morrow; "them no care." The shouts, the gaiety, the wild laughter, the strange and sudden bursts

of singing and dancing, and several old women, wrapped up in large cloaks, their heads bound round with different-coloured handkerchiefs, leaning on a staff, and standing motionless in the middle of the hubbub, with their eyes fixed upon the portico which I occupied, formed an exact counterpart of the festivity of the witches in Macbeth. Nothing could be more odd or more novel than the whole scene; and yet there was something in it by which I could not help being affected—perhaps it was the consciousness that all these human beings were my *slaves*: to be sure, I never saw people look more happy in my life, and I believe their condition to be much more comfortable than that of the labourers of Great Britain: and, after all, slavery, in *their* case, is but another name for servitude, now that no more negroes can be forcibly carried away from Africa, and subjected to the horrors of the voyage, and the seasoning after their arrival: but still I had already experienced that Juliet was wrong in saying, "What's in a name?" for soon after my reaching the lodging-house at Savannah-la-Mar, a remarkably clean-looking negro lad presented himself with some water and a towel. I concluded him to belong to the inn; and on my returning the towel, as he found that I took no notice of him, he at length ventured to introduce himself by saying, "Massa not know me; *me your slave*!"—and really the sound made me feel a pang at the heart. The lad appeared all gaiety and good humour, and his whole countenance expressed anxiety to recommend himself to my notice; but the word "slave" seemed to imply that, although he did feel pleasure then in serving me, if he had detested me, he must have served me still. I really felt quite humiliated at the moment, and was tempted to tell him, "Do not say that again; say that you are my negro, but do not call yourself my slave." Altogether, they shouted and sang me into a violent headache. It is now one in the morning, and I hear them still shouting and singing. I gave them a holiday for Saturday next, and told them that I had brought them all presents from England; and so, I believe, we parted very good friends. The joy which 'massa's' presence caused spread even beyond the boundary of his estate. Many manumitted negroes also came from other parts of the country to this festival on hearing of my arrival; because, as they said, "if they did not come to see massa, they were afraid that it would look ungrateful, and as if they cared no longer about him and Cornwall, now that they were free." So they stayed two or three days on the estate, coming up to the house for their dinners, and going to sleep at night among their friends in their own former habitations, the negro huts; and when they went away, they assured me that nothing should prevent their coming back to bid me farewell before I left the island. All this may be palaver; but certainly they at least play their parts with such an air of truth, and warmth, and enthusiasm, that after the cold hearts and repulsive manners of England, the contrast is infinitely agreeable."

The first thing which shocked the feelings of the humane proprietor was the revolting use made of the cart-whip, and he at once abolished it. 'I am indeed assured by every one about me, that to manage a West Indian estate without the occasional use of the cart-whip, however rarely, is impossible; and they insist upon it, that it is absurd in me to call my slaves ill-treated because, when they act grossly wrong, they are treated like English soldiers and sailors. All this may be very true; but there is something to me so shocking in the idea of this execrable cart-whip, that I have positively forbidden the use of it on Cornwall; and if the estate must go to rack and ruin without its use, to rack and ruin the estate must go.' The effect of his lenient measures was very much as had been anticipated. Deprived abruptly of what had been their only incentive to labour, and as yet unprovided with any of a superior nature, while all the arrangements were of course unfitted to maintain the new system in any degree of efficiency, the negroes became idlers and

* *Life and Works of Byron*, vol. vii.

skulkers to a distressing degree, and even felt so indifferent to their master's interests, that, when the cattle got among the canes by night, they would not take the trouble to drive them out again. 'They rejoice sincerely,' says Lewis, 'at being very well off, but think it unnecessary to make the slightest return to massa for making them so.' Still, he persevered in his good designs; and the strongest step he could be induced to take before quitting the island, was to draw up a code of laws for the guidance of the trustees on his estates, and admitting of punishments only under many humane restrictions.

On the 31st of March he prepared to return to England, and thus describes the leave-taking:—'With their usual levity the negroes were laughing and talking as gaily as ever till the very moment of my departure; but when they saw my curricie actually at the door to convey me away, then their faces grew very long indeed. In particular, the women called me by every endearing name they could think of. "My son! my love! my husband! my father!" "You no my massa, you my tata!" said one old woman; and when I came down the steps to depart, they crowded about me, kissing my feet and clasping my knees, so that it was with difficulty that I could get into the carriage. And this was done with such marks of truth and feeling, that I cannot believe the whole to be mere acting and mummery.' The really pathetic farewell which he received from a beautiful female slave inspired her master with the following pretty verses:—

YARRA.

Poor Yarra comes to bid farewell,
But Yarra's lips can never say it;
Her swimming eyes, her bosom's swell—
The debt she owes you, these must pay it.
She ne'er can speak, though tears can start,
Her grief that fate so soon removes you;
But One there is who reads the heart,
And well He knows how Yarra loves you.

See, massa, see this sable boy:
When chill disease had nipped his flower,
You came and spoke the word of joy,
And poured the juice of healing power.
To visit far Jamaica's shore,
Had no kind angel deigned to move you,
These laughing eyes had laughed no more,
Nor Yarra lived to thank and love you.

Then grieve not, massa, that to view
Our tale you left your English pleasures;
One tear, which falls in grateful dew,
Is worth the best of Britain's treasures.
And sure the thoughts will bring relief,
Whate'er your fate, wherever rove you,
Your wealth's not gained through pain and grief,
But given by hands and hearts that love you.

May He who bade you cross the wave,
Through care for Afric's sons and daughters,
When round your bark the billows rave,
In safety guide you through the waters!
By all you love with smiles be met;
Through life each good man's tongue approve you;
And though far distant, don't forget,
While Yarra lives, she'll live to love you!

After another rough passage, Mr Lewis landed at Gravesend on the 1st June 1816. He made but a short stay in London, and started for Italy, meeting at Geneva his friends Lord Byron and the unfortunate Shelly. By the advice and assistance of these poets Lewis made a codicil to his will, which bore exclusive reference to the comfort of his slaves. 'Having convinced myself,' he testifies, 'that the negroes cannot with certainty be protected in their rights and comforts if they are left entirely to the care of an attorney, and never visited by their proprietor, I wish to prevent this from ever happening again, to the very utmost of that power which the law allows me. I therefore order that whoever shall, after my death, be in possession of my estate of Cornwall, shall (if a man) pass three whole calendar months in Jamaica every third year, either in person, or by deputing one of his sons, or one of his brothers. If a woman, she must perform this condition either in

her own person, or by deputing her husband, or one of her sons, or one of her brothers.' To this codicil the illustrious names of Byron and Percy Bysshe Shelly, with the less known one of John Polidori, are appended as witnesses to the testator's signature.

The interest which Lewis took in his Jamaica negroes would not allow him to rest in England, and, unwilling to impose a condition on his successors which he shrunk from fulfilling himself, he embarked for a second visit to his estates in the following year, arriving at Cornwall on the 25th January 1818. All his dependents were, he writes to his mother, 'delighted to see me; but all said that everything during my absence had gone on just as if I had never left them; that all their superintendents were kind to them, treated them well, and they were quite easy and contented. Many have come to tell me how sick they were, and likely to die, if they had not been so well nursed in the hospital; others have been to say, that they had formerly complained to me of such and such things, but now they were so well treated, that they begged to withdraw their complaints, and assured me that they were ready to do anything that might be thought necessary for my service. On the other hand, my attorneys declare themselves well satisfied with the general conduct of my negroes. One of them (who is also attorney for Lord Holland's estate, adjoining mine) owns that he finds it much more troublesome to manage Lord H.'s negroes than mine, and that mine work much better. In particular, they have already dug one hundred acres of cane-holes, without any hired assistance, for next year's planting, while Lord H.'s have not dug one acre, although he has forty negroes more, and pays nearly £400 a-year for hired labour besides. If all this had been written to me, I should not have believed a word of it. But I see it with my own eyes, and shall leave the island with a heart a thousand pounds lighter, for having acquired the certainty that I leave my poor negroes in hands that will treat them kindly.* In his journal he states, under the 14th February, 'Although I have now at least seen every one of them, and have conversed with numbers, I have not yet been able to find one person who had so much as even an imaginary grievance to lay before me. Yet I find that it has been found necessary to punish with the lash, although only in a very few instances; but then this only took place on the commission of absolute crimes, and in cases where its necessity and justice were so universally felt not only by others, but by the sufferers themselves, that instead of complaining, they seem only to be afraid of their offence coming to my knowledge; to prevent which, they affect to be more satisfied and happy than all the rest; and now, when I see a mouth grinning from ear to ear with a more than ordinary expansion of jaw, I never fail to find, on inquiry, that its proprietor is one of those who have been punished during my absence. I then take care to give them an opportunity of making a complaint, if they should have any to make; but none is uttered; "everything has gone on perfectly well, and just as it ought to have done." Upon this I drop a slight hint of the offence in question, and instantly away goes the grin, and down falls the negro to kiss my feet, confess his fault, and "beg massa forgib, and them never do so bad thing more to fret massa, and them beg massa pardon, hard, quite hard!" But not one of them has denied the justice of his punishment, or complained of undue severity on the part of his superintendents.'

One chief inducement for Mr Lewis's second trip was to visit his other estate, which was situated near the northernmost extremity of the island, and called Hordley. The extraordinary condition in which he found this plantation is thus detailed:—'Report had assured me that Hordley was the best-managed estate in the island; and, as far as the soil was concerned, report appeared to have said true: but my trustees had also assured me that my negroes were the most contented

and best-disposed, and here there was a lamentable incorrectness in the account. I found them in a perfect uproar; complaints of all kinds stunned me from all quarters; all the blacks accused all the whites, and all the whites accused all the blacks; and, as far as I could make out, both parties were extremely in the right. There was no attachment to the soil to be found here; the negroes declared, one and all, that if I went away, and left them to groan under the same system of oppression, without appeal or hope of redress, they would follow my carriage and establish themselves at Cornwall. . . . I had been assured that, in order to produce any sort of tranquillity upon the estate, I must begin by displacing the trustee, the physician, the four white book-keepers, and the four black governors. What with the general clamour, the assertions and denials, the tears and the passion, the odious falsehoods, and the still more odious truths, and (worst of all to me) my own vexation and disappointment at finding things so different from my expectations, my brain was nearly turned, and I felt strongly tempted to set off as fast as I could, and leave all these black and white devils to tear one another to pieces—an amusement in which they appeared to be perfectly ready to indulge themselves. It was, however, considerable relief to me to find, upon examination, that no act of personal ill-treatment was alleged against the trustee himself, who was allowed to be sufficiently humane in his own nature, and was only complained of for allowing the negroes to be maltreated by the book-keepers, and other inferior agents, with absolute impunity. Being an excellent planter, he confined his attention entirely to the cultivation of the soil, and when the negroes came to complain of some act of cruelty or oppression committed by the book-keepers or the black governors, he refused to listen to them, and left their complaints uninquied into, and consequently unredressed. The result was, that the negroes were worse off than if he had been a cruel man himself; for his cruelty would have given them only one tyrant, whereas his indolence left them at the mercy of eight. Still, they said that they would be well contented to have him continue their trustee, provided that I would appoint some protector, to whom they might appeal in cases of injustice and ill usage.' A protector being appointed, and some of the inferior officers superseded, 'I read to them my regulations for allowing them new holidays, additional allowances of salt, fish, rum, and sugar, with a variety of other indulgences and measures taken for protection, &c. All which, assisted by a couple of dances, and distribution of money on the day of my departure, had such an effect upon their tempers, that I left them in as good humour, apparently, as I found them in bad.' A little kindness and judicious treatment effected a complete reform throughout the whole estate, and its proprietor returned to Cornwall.

The good which Mr Lewis's presence and benevolent management effected, may be inferred from the closing paragraph in his journal. 'What other negroes may be, I will not pretend to guess; but I am certain that there cannot be more tractable or better disposed persons (take them for all in all) than my negroes of Cornwall. I only wish that, in my future dealings with white persons, whether in Jamaica or out of it, I could but meet with half so much gratitude, affection, and goodwill.' On the 4th May 1818 Lewis embarked on his homeward voyage. He was in excellent health at this time; but some days after, the dreaded yellow fever made itself apparent on board. More from fright than real illness, Mr Lewis took to bed; and feeling one night extremely discomposed, he had the ship's steward called up, and demanded a dose of an emetic. Remonstrance was useless: in the hurry of the moment, to comply with his impatience, a strong emetic was imprudently administered by the steward, who had the care of the medicine chest; and on the 14th May our amiable journalist breathed his last. His remains were on the same day committed to the deep. Such was the untimely end of one in whom were strangely blended some of the

most frivolous and most respectable of human qualities—a fashionable novelist, a butterfly of fashion, yet at bottom a right-hearted and conscientious man. 'I would,' says Byron—

'I would give many a sugar-cane
Mat. Lewis were alive again.'

DISCOVERIES IN PRINTING.

UNDER the head of 'New Graphic Wonders,' we described in our 58th number an invention by which the finest engraving on steel can be transferred to other plates, so as to multiply impressions to infinity. We also adverted to a second process by which the same advantage can be obtained for letterpress, by means of what the patentees designate *Anastatic Printing*. The means by which this is to be accomplished has been fully developed in the February number of the *Art-Union*. 'Let us suppose a newspaper about to be reprinted by this means. The sheet is first moistened with dilute acid, and placed between sheets of blotting-paper, in order that the superfluous moisture may be absorbed. The ink neutralises the acid, which is pressed out from the blank spaces only, and etches them away. In all cases where the letterpress is of recent date, or not perhaps older than half a year, a few minutes suffice for this purpose. The paper is then carefully placed upon the plate with which the letterpress to be transferred is in immediate contact, and the whole passed under a press, on removal from which, and on carefully disengaging the paper, the letters are found in reverse on the plate, which is then rubbed with a preparation of gum, after which the letters receive an addition of ink, which is immediately incorporated with that by which they are already formed. These operations are effected in a few minutes. The surface of the plate round the letters is bitten in a very slight degree by the acid, and on the application of the ink it is rejected by the zinc, and received only by the letters, which are charged with the ink by the common roller used in hand-printing. Each letter comes from the press as clear as if it had been imprinted by type metal; and the copies are fac-similes which cannot be distinguished from the original sheet.

'Thus far it may be necessary to describe the process, that it may be understood by those of our readers who are not versant with lithographic manipulation; those who are, will recognise some similarity in the methods of preparing the stone and the zinc, as far as regards the gum, &c. The practicability of transferring letterpress, especially prepared or quite recent, to stone or zinc, has long been known. A main advantage, however, and a most important one, possessed by the zinc over the stone, as a mere material to work from, is its portability, and being easily formed into a cylinder; for, although we have only spoken of a plate of zinc in relation with the results we have witnessed, it is to be understood that in extensive operations cylinders will be employed.' Thus it will be seen that the new process produces all the effects of stereotyping, with the advantage of taking the duplicate from a printed impression, instead of from the metal types themselves. So far, however, as we can ascertain, one disadvantage attaches to the new process, which is, that in working off impressions from the zinc plates, a kind of press must be used different from that employed for types—one partaking somewhat of the nature of a lithographic press. Till, therefore, the inventors proceed with their improvements so far as to cause the acid to corrode the interstices of the letters sufficiently deep into the plate, as to make them stand relief of equal height with types, we do not anticipate that, as a substitute for stereotyping, it will be so extensively used as they anticipate. It may also be remarked that the economy of this invention will chiefly be seen in works of limited sale. In such as the present, the typographical arrangements sink into a bagatelle beside the enormous outlay for

paper, an abolition of the duty on which would be of more use to such works than an invention doing away with every other expense whatsoever.

In another department of relief printing, there is no question that the anastatic process will cause a complete revolution, and that very speedily; namely, in illustrative and ornamental printing. Wood-engraving will be entirely superseded, for no intermediate process will now be necessary between the draughtsman and the printing of his design. It is generally known that at present the artist draws in pencil his design on the boxwood, and that the engraver, with sharp instruments, cuts away all the white parts or interstices, so as to cause the objects previously figured to stand in relief, that they only may receive the ink passed over them in printing. Unfortunately, many wood-engravers, from want of skill in drawing, do not render the intentions of the designer with fidelity. Now, however, all the draughtsman will have to do will be to make his drawing on paper, and *that*, line for line, will be transferred to the zinc, and produce, when printed, exactly the same effect as his original draught. A pen is recommended for this purpose, which may be used 'on any paper free from hairs or filaments, and well sized. The requisite ink is a preparation made for the purpose, and may be mixed to any degree of thickness in pure distilled water, and should be used fresh and slightly warm when fine effect is to be given. In making or copying a design, pencil may be used, but the marks must be left on the paper, and by no means rubbed with India-rubber or bread. The paper should be kept quite clean, and free from rubbing, and should not be touched by the fingers, inasmuch as it will retain marks of very slight touches.' A drawing thus produced can be readily transferred to the zinc in the manner above described for typography.

Two pages of the Art-Union are printed upon the new plan. Besides the letterpress, from which we derive our present information, are five printed drawings and an illuminated letter. 'The letterpress,' says the editor, 'was first set in type by the ordinary printer of the Art-Union, leaving spaces for the drawn or engraved illustrations, which having been set into their respective places on a proof of the letterpress, the whole was cast on to a zinc plate, and so printed off.' Neither is it to printing of recent date only that the invention is applicable; transfers from books a century old have already been made. 'Rare editions' and 'unique copies' will in a few years vanish from the counter of the book-sale and the shelves of the bibliomaniac. Now it is ascertained how exactly they may be counterfeited, not even Doctor Dibdin himself will be able to venture to pronounce upon a 'genuine black-letter.'

AN AUTUMN DAY AT BADEN-BADEN.

I HAD for the whole summer beaten about from one German bath to another, with perhaps as little defined a purpose as Captain Absolute enjoyed in his celebrated journey to Bath. I had taken the *Kurbrunnen* at Homburg, and witnessed the *petit jeu* of the players by profession, who, now exiled from Paris, fix their quarters there for the whole year. I had listened to the long catalogue of complaints for which our countrymen and women flow in shoals to Wiesbaden. I had climbed the hill at Schlungenbad, to read the inscription upon the column placed by a newly-married count, in commemoration of his wedding trip, and the happy hours passed at this retreat with his 'Fanny.' I had seen the great lion of Schwalbach, the Fenner von Fenneberg, who still retails the same phrases, rendered immortal by his old Bubble historian. Last of all, I had met with Russians and Mexicans, Norwegians and Spaniards, at the *table d'hôte* at Ems, and had elbowed at the *Kranchen* princes

from every principality in Germany. At each of these places had I been assailed with the inquiry—'Have you not yet seen Baden?' 'No.' 'Then you have as yet seen nothing. The view from the Alte Schloss exceeds everything that is to be witnessed hereabouts,' said a chance-thrown companion at Ems. 'Oh, how miserably dull and wretched is this place!' exclaimed in one voice a newly-married pair, the first of my acquaintances I saw at Schwalbach. 'Dear Baden-Baden, how gay, how charming last year!—the conversation-house, the music, the promenades, the rides, the drives!' sighed forth the bride, blushing in her orange blossoms. 'The *Gros jeu*, the restaurant, the *Gallerie des fumeurs*,' chimed in the bridegroom in the base tones of his voice. 'Oh, my dear fellow, if you have not yet been to Baden-Baden, either go there at once, or cease to speak of Nassau.'

'Upon my word,' thought I, as I left them with their commendations ringing in my ears, 'I must be off to Baden.' So, walking meditatively back to my hotel, I immediately ordered my *rechnung*, and, what is more, paid it. I made up pack and baggage. I had thus passed the Rubicon of many a previous hesitation. Preferring, on account of the warm weather, the old beaten track up the Rhine to the Eilwagen with dusty roads, Frankfurt, and the picturesque *Bergstrasse*, I took the steamboat at Coblenz to Mannheim.

In few places, perhaps, does the sun at its setting present a more beautiful appearance than when seen upon this river. Owing to the mountainous nature of the country, one has but little of the intermediate light, the gradual sinking and dying away witnessed in flat lands. The sun, long before its actual disappearance from the horizon, rests in but little less than its noonday splendour upon some tall peak, throws a last farewell upon the violet-coloured hills, and then is lost. He departs like a man in the pride and prime of life, evincing none of the glimmerings and decrepitudes of decline; and as such, he remains upon the memory. Accident very much heightened the effect; for I do not imagine myself illustrious traveller enough to suppose that the scene was got up for my especial gratification, at the expense of a village. It was a lovely clear night, when, in the distance, one of those occurrences so frequent in Germany took place—a fire burst out: it issued first from a chimney, it then blazed through a long range of windows, and, to judge from the heightening flames, its work of devastation was complete, when a turn in the river, and our arrival at Mannheim, hid it from sight.

Two years ago it was a somewhat lengthy journey from Mannheim to Baden-Baden; but now four hours by railroad accomplish it. 'Not a soul in Baden—quite deserted this year—given up—fashion gone by,' was my first greeting at the station at Oos, from an acquaintance upon the point of leaving.

'What! with a list of twenty-seven thousand visitors?' said I quietly, making use of a piece of information I had obtained.

'No matter—very dull—last year thirty thousand,' and he hurried off, discontented with really a paradise, like a thousand other tourists, because the Smiths, the Joneses, and the Snooks of his peculiar set had not been there. In how many cases does man absurdly reverse the telescope of his perception, and receive impressions through the narrowest medium.

I must confess that I entered Baden with that self-same curiosity, if not awe, which one invariably feels in

always been held up to me as a very great one, my feelings of expectation were proportionate. And I was not disappointed; it is indeed the very king, queen, and whole royal family to boot, of German spas. It was September; the season was drawing towards its conclusion. Still, sufficient people were remaining to give a perfect notion of its attractions when the season is at its height. As some inducement to us later birds of passage to prolong our stay, if not to offer us some compensation for the past glories we had lost, what were we promised?—a boar hunt—a real German boar hunt!

From the hunting of the Caledonian boar, down to these our times, there has been for me a certain excitement in the very name: it speaks of danger, of the thick and noble forest, of the jager's horn, of the baying of hounds, of foaming steeds, of stirring strife, of green, and gold, and buff. And here I was to have the reality of many a wishful dream.

At seven o'clock of Saturday, 21st September, all was in motion.

There was a hurrying to and fro.

The merry horn and cavalcade started me from my coffee, and hastily drawing on a huge pair of postillions' boots, borrowed for the nonce, and taking a thick whip, my only arms, I threw myself with three others into an open light calèche, and off we set. I had taken the precaution of sending on a stout Wurtemberg hack an hour or so earlier, to be ready for the chase.

At starting, the morning was fresh and lovely, clear as in the spring, and on we dashed through forest glade and village. A mile or two out of Baden, one of those changes of weather to which the neighbourhood of the Rhine is liable in the autumn, enveloped us in a thick fog, and we drove on in almost worse than a Scotch mist; but, sticking closely to our pipes, we defied the cold; and by keeping up a dense cloud of smoke, we managed to make our immediate atmosphere warm and dry enough. The *rendezvous de chasse* was some three pipes, one cigar and a half, German reckoning, distant; that is, about a two hours' drive. Our cavalcade, having upon the road become somewhat disorganised, we halted at a village a quarter of an hour this side of the scene of action. All the stragglers came in by twos and threes, some on horse, some on foot, but the greater number in that most comprehensive of all terms, and teams, a *wagen*, as it embraces every denomination, from a four-in-hand to a go-cart. If not so lordly a scene, it was much more picturesque, because more unsophisticated, than the meet of the queen's hounds at Windsor. The good villagers were crowded at every door, and from every window peeped out the head of some village beauty. We took possession of the whole place, and the mist clearing off, giving way to a splendid sun, ladies and huntresses, in every variety of costume, horses, dogs, and carriages, pipes, cigars, tobacco smoke, whip-smacking and horn-blowing, stood out in bold relief, and in most laudable rivalry in chattering and noise.

Having at last taken order, we proceeded to the forest in excellent style. A soul-stirring *fa fa* led us on. At a short distance within the wood was a large open space, just in the rear of which were the boars—

Cabined, cribbed, confined.

Four had been procured from the neighbourhood of Carlsruhe, and were penned up in a wooden enclosure, with a trap-door to turn them out at. The whole meet was capitally marshalled in the open space, men on foot being foremost, horsemen next, and carriages in the back-ground. A short half hour sufficed for preparation and necessary directions, during which time breathless expectation and excitement appeared upon every face. About ten couples of hounds had been brought to the rear of the enclosure, just near enough

to catch a good sight of the savage inmates, and sufficiently far away to allow a fair start. The ground now assumed a stirring aspect: the hounds bayed; the boars, roused to fury, roared; the horsemen ranged themselves in two semicircles, and the men on foot completed a serried avenue, forcing upon the boar no choice as to his course when turned out upon the world.

'Sound the *fa fa*,' shouted Monsieur Haug; and a merry clang rang through the forest. 'Turn out the boar,' shouted Haug again.

'Turn out the boar,' echoed a hundred voices in German, French, and English, with every variation of native and foreign accent.

And out he was turned; and away he started amidst shouts and bayings, neighings, and shrill notes from the bipeds and quadrupeds behind him; horse, and foot, and hounds, all pell-mell. He was a fine fellow, rather beyond the middle size, with long tusks. He took gallantly across the small plain, the hounds following close at his heels, and we were soon almost lost to each other in the wood. Here and there a horseman might be spied through the trees. The most of *jeune France* returned quickly back to the rendezvous, thinking it better to display their *caracoles*, and high boots, and ornamented *couteaux de chasse* to

The sweet eyes of a lady's fayre,
Than rouse the wyld boar from his laire.

On, on we hurried, as fast as the nature of our hunting-ground would allow, sometimes close upon our prey, oftener at fault, as he better knew the dodges than the hounds, which were unfortunately novices. We at length got on the right scent; and after a long and well-managed attack and defence through almost every bit of underwood, without coming actually to close quarters, we succeeded in getting him quite at bay on the confines of the forest. Escape seemed impossible; but, worried to the uttermost by the bellowing hounds and shouting horsemen, our friend made a desperate rush, and fairly broke through. Off he took himself to a wide plain beyond, running as hard as he could. We pushed on out of the wood in full pursuit. A large pond stood a quarter of a mile off; at it he dashed, and in he rushed, and slaking his thirst, quietly swam about, as unconcerned as though he were in his native fastness feeding amongst his companions. Our hounds at this juncture fairly showed the white feather. One or two jumped in, but kept at a respectful distance. The remainder did their worst, which began and ended with a bark. A shot here at the boar might easily have finished the sport; but all disdained to take advantage of so brave a foe. Having amused himself to his own contentment, he swam out, and, like a giant refreshed, bid us fair defiance. The hounds were become mere playthings for him, and we gave him all the chances of the game. Could he but reach a forest opposite, we should be again at fault: the hounds, dead beat, were not at all inclined to come to close quarters. One by one the pursuers were dropping off, and the boar was very nearly having the honours of the day entirely to himself. At length, thinking the chase had lasted long enough, and not very desirous of having our work to do over again, we made head, and came up to our antagonist. There were but two staunch fellows, Germans, and myself at the mort, and no hounds to receive their *curée*. The boar, nothing daunted, turned round, halted, grunted defiance, and waited the attack. The young and chivalrous Lieutenant Baron de H—, eager for distinction, pressed bravely on. The poor boar was still undaunted, and 'nothing in his life would have become him like his leaving it;' when, in the very moment of the baron's assumed triumph—his arm nerved like iron, his eye and hand steady as a marble Actæon—his foot unfortunately slipped, and the sword missed its aim. The boar, slightly wounded, rushed towards him, and caught in his ugly fangs the baron's left hand as he was falling, and bit it through. And now, goaded by fury, and thirsting for more blood, he

threatened to make sad work of our handsome friend, and undoubtedly would have done so but for our rescue. Pressing sorely on the enraged animal, we succeeded in diverting him from his victim. He turned fiercely on the nearest horseman, the Baron K——, tore off the heel of his heavy boot, and left us nothing to hope for from him in the shape of kindness. K—— thought it high time to turn the tables; so, presenting his sword, our adversary ran upon it, and next instant fell dead without a struggle. We returned in triumph to the shady glade, and the hero of the chase deposited his spoil at the feet of a Russian princess.

Thus ended the boar hunt, but not so our entertainment. It was to our no less satisfaction than surprise that we found, upon our return, as if by magic, dinner-tables spread under the green trees. Where but two or three hours earlier we had left nothing but the sylvan sward, stood all the appliances of Haug's restaurant. What could be better? Fires were blazing in all directions, soups boiling, cutlets broiling, coffee sending forth its delicious aroma, kellers hieing everywhere, Bourdeaux wine, *premier crue*, covering the tables, which were decked with cloths white as the fleecy clouds above us, and the ladies, with the *sans ceremonie* of a pic-nic, were seated around them. The Distin family, with their horn band, kept up a lively strain, and nothing could exceed the hilarity of the party. The agreeable surprise, the beauty of the scenery, and the lovely weather, carried the mind back to those delightful descriptions of Boccaccio, so much read and dwelt upon, but so seldom realised. I think, had every one present been canvassed, life in the woods would have been for the time the unanimous choice.

The fact was, upon the road, early in the morning, we had overtaken a huge tumbril wagon, which the practised eye of a sailor would have set down for a most rakish and suspicious-looking craft. It was strongly guarded by six stout fellows, armed to the teeth, who, in default of a more intimate acquaintance, might well have been imagined to guard some state prisoner. The team dragged slowly and heavily on through the ruts of a cross road, and nothing could induce the drivers to pull up to let us pass; 'ja, ja,' and a cloud of smoke, was the only answer we could get to our remonstrances. The sturdy troop of guardians prevented of course an appeal to arms. At the time, the whole thing seemed a mystery, one of those Quixotic appearances that, to any other but ourselves, so well versed in the good realities of German life, would have been something too ideal for an adventure.

We at last got on, and the circumstance passed from our minds. A little patience not only cures most evils, but solves many a mystery; so it was with us. In one corner of the enclosure quietly stood our tumbril of the morning, disemburthened of its hidden contents in the shape of the good cheer surrounding us on all sides. The guards were transformed into bustling kellers, whose guns were peaceably laid aside for their after share in the day's fun. The truth is, that it was one of the annual offerings that the liberality of the millionaire Benazet makes to the visitors of Baden-Baden, a sort of wind-up to the season for those who are leaving, and an opening of the sports to those who remain during the winter.

No sooner had every eatable and drinkable been fairly disposed of—when it really became a matter of difficulty to wind one's way through the straggling squares and streets and lanes of empty bottles everywhere formed upon the ground—than a clearance was made for the third act of this exciting drama. A mark was set up, and we were presently engaged in a scene beating hollow in its picturesqueness everything seen, heard, and known of the trial-shot in Freischütz. The Germans are excellent marksmen, and fond of the amusement. At every shot arose a shout of triumph from the friends of the man who had fired. The music continued inspiring and woodland notes, and the approach of evening alone put an end to the sports. We were

then marshalled into the same order as upon our coming, and, preceded by the piqueurs, who bore in a car the second hero of the day in triumph, and with the merry fa fa all the way, we returned to Baden, where again and again we have since hunted the boar over many a flash of markgrafer.

'THE TRADE.'

FIRST ARTICLE.

BOOKSELLING BEFORE THE INVENTION OF THE PRESS.

It has long been acknowledged that the bookselling business, from its very nature, requires a greater amount of intelligence to be successfully carried on than any other branch of trade. Authors—who must be considered good judges of the matter—have, as a body, testified in favour of this view of bookselling; and although disappointed writers occasionally show an aptitude to decry 'the trade' and its professors, yet the most eminent authors have seldom joined in such a condemnation. Dr Johnson speaks of them only too highly, for he designates them 'the patrons of literature,' whilst in truth they are only the agents of its real patrons, the public. D'Israeli the elder remarks, that 'eminent booksellers, in their constant intercourse with the most enlightened class of the community—that is, the best authors and the best readers—partake of the intelligence around them.' Booksellers are inseparably identified with literary history. Whoever, therefore, takes an interest in that progress of civilisation which has been helped on so materially by letters, will find much to instruct and entertain him in tracing back, through the records of past time, the rise and vicissitudes of the book-trade, and by finally looking round on the present condition of things, and following its progress up to the state in which it now exists. With this view we have busied ourselves in collecting various historical notices and anecdotes concerning booksellers and their craft from the earliest down to the present time.

Before the invention of printing, the articles in which the booksellers dealt were manuscripts. These were inscribed on some flexible material, manufactured either from the inner bark of trees (hence the Latin word *liber*, and the German *buche* or book), from the leaves of the papyrus plant, or from leather or parchment. In one of the earliest forms of books, only one side of the material was written on, and one sheet was joined to the end of another till the work, or one section of it, was finished, when it was rolled up on a cylinder, or staff. The leaves composing such books were designated *paginae*, from which we derive our term 'page'; the sticks upon which they were rolled were *cylindri*, at each end of which was a knob for evolving the scroll. These balls were called *umbilici*, or *cornua*, 'horns,' of which they were often made, though sometimes composed of bone, wood, or metal, either elaborately carved, or richly inlaid with gold, silver, or precious stones: the edges of the scroll were called *frontes*. On the outside of each scroll was written its title.* In the earlier manuscripts, the writing was not divided into words, but joined in continuous lines. The Greeks read from right to left, and from left to right alternately, the reader commencing the one line immediately under the termination of the line above. This was a highly necessary arrangement for the guidance of the reader, who, by adopting the modern plan, would have been very apt to 'lose his place' on account of the extreme length of the lines; for those ancient volumes were much larger than we at the present day have any notion of.† The scroll,

* The ancients seldom numbered the divisions of their works as we do, but named them after some deity or patron. Thus the books of Herodotus respectively bear the names of the Muses.

† The implements used by a Grecian or Roman scribe were as follows:—A reed cut like our pens; inks of different colours, but chiefly black; a sponge to cleanse the reed, and to rub out such letters as were written by mistake; a knife for mending the reed; pumice for a similar purpose, or to smooth the parchment; compasses for measuring the distances of the lines: *arsura* for cut-

when rolled up, was often a yard and a half long, and the lines of manuscript consequently very little short of that, across. When extended, each volume was sometimes fifty yards long. A roll of calico, such as is seen standing at linen-draper's shop windows, will give the reader some idea of the external form of an ancient book, without its umbilicus or roller. Each scroll was usually washed in cedar-oil, or strewn between each wrap with cedar or citron-chips, to prevent it from rotting or being eaten by insects. Ancient books did not exclusively consist of scrolls. The Romans had also books of papyrus, or vellum, folded in square leaves like ours. These they called *codices*.

Such were the articles which formed the stock in trade of a Grecian bookseller. The trader was also the manufacturer, keeping a number of transcribers to make copies of the works he sold. Diogenes Laertius mentions that there were at Athens public bookshops called *Bibliopoleis*; nor were these libraries solely devoted to the copying and selling manuscript books, for it was the custom among the learned to meet in the shops to discuss the literary gossip of the day, to criticise, possibly, a new comedy by Aristophanes, the tragedy of the last feast of Bacchus, or to dispute on the latest philosophic theory. In those times when, from the extreme labour of producing them, books were both dear and scarce, the shopkeeper sometimes hired a qualified person to read a new manuscript to his learned customers, and to give an exposition or lecture concerning it. This must have been an important branch of his business; for, from the high price of books, the sale of copies must have been upon a very limited scale. The works of Plato appear to have had an unusually large circulation, for concerning them history records one of the earliest instances of literary piracy: Hermodorus the Sicilian, a disciple of that philosopher, having turned his attention to bookselling, extended the sale of his master's works not only throughout Greece, but as far as Sicily. This was done, however, without the consent of the author.

When literature, in its onward course, left the shores of Greece and fixed itself for a time at Alexandria, under the fostering encouragement of the Ptolemies, the book-selling business had become of so important a character, that a regular market was established for the sale of manuscripts. 'The trade' was chiefly composed of emigrant Greeks, who had by that period acquired a character all over the civilised world for cunning and knavery. Hence we find Strabo bitterly complaining that most of the volumes at the Alexandrian market were 'copied only for sale'; in other words, hastily, and without revision or comparison with the originals. He also laments that the impertinence of the transcribers introduced matter which the author never penned. This scanty information is all which exists concerning the booksellers of the old world. When, however, literature forsook the east, and, travelling westward, set up a long rest in Rome, more ample details concerning their mode of doing business are at our disposal.

The first mention of Latin books, as forming regular articles of commerce, is made by several writers who existed during the time of the Roman emperors. It is to be inferred that, previous to that time, people of distinction borrowed works from their authors, and caused copies to be made either by professed scribes (*librarii*), or by their own slaves. Gradually, however, the demand for books made it worth while for certain individuals to devote time and capital to their purchase, and these tradesmen were designated, after their Grecian brethren, *bibliopole*. Their shops were in public places: in, for instance, the well-frequented streets near the Forum, the Palladium, the *Sigilarii*, the *Argiletum*, and the

Temple of Peace; but principally, according to Gellius, in the *Via Sandalinaria*. These shops being, as at Athens, much resorted to by men of letters, were the chief sources of literary information; they formed what modern newspapers call an 'excellent advertising medium': announcements of new works were constantly exhibited not only outside the shops, but upon the pillars of the interior. Depôts for the sale of manuscripts were also to be met with in the provincial towns. Amongst the Roman booksellers originated the practice of purchasing copyrights, and it has been clearly ascertained that several of the most celebrated Latin works were the exclusive property of certain bibliopole. The names of several of these booksellers have been handed down to posterity, chiefly on account of their excellent mode of doing business, and for the care which they took in insuring the correctness of the manuscripts they sold; frequently going to the additional expense of employing the authors themselves to examine and compare the copies made from their works. The *Tonsona*, *Longmana*, *Cadella*, and *Murrays* of the times of Horace, Cicero, Martial, and Catullus (who mention them), were the 'speculative' Tryphon, the 'prudent' *Atrectus*, *Tul. Lucensis* 'the freed man', the brothers *Sosius*, *Q. P. Valerianus Dicus*, and *Ulpian*. We are informed by *Galenus* that less respectable book-dealers took dishonest advantage of the fair fame of these magnates in the 'trade,' by forging the imprints of those celebrated publishers upon imperfect and ill-written copies.*

With the fall of the Roman empire the bookselling business not only declined, but was for a time swept away from the list of trades. Literature and science, ingulfed in the monastic system, were hidden in the cloister. The monks became the transcribers of books, and in this laborious occupation the learned Benedictines are known to have particularly excelled. The works produced by these religious men were almost exclusively missals, or books of devotion; copies of the Scriptures were also produced by them, though to a less extent. There was, however, at this period, a great difficulty in procuring material on which to write books, and the device, more ingenious than commendable, was resorted to of deterring the writing of old classics, and then using the cleaned parchment for the works required. This practice is understood to have caused the loss to the world of several classic authors. Occasionally, in old collections of manuscript books, a missal or copy of the Gospels is to be seen inscribed on vellum, on which shines faintly the not-altogether obliterated work of an ancient writer. We lately saw, in the *Bibliothèque Royale*, or great public library in Paris, a copy of the Gospels as old as the ninth century, which had thus been written on the cleaned pages of a classic author. Whether on new or old vellum, a great number of books were copied and collected in England during the eighth century; the monks of that period having been exceedingly emulous of attaining skill in writing and illuminating; and at a later period, this was enumerated as one of the accomplishments even of so great a man as *St Dunstan*. They abandoned the system of writing on scrolls, adopting the form in which books are now printed. Yet posterity had little benefit from these great assemblages of books; for, during the numerous inroads of the Danes from the ninth to the eleventh century, many of the richest libraries were committed to the flames, along with the monasteries which contained them.† In the thirteenth century, books were, from these destructions, extremely scarce, and the few that existed were exclusively in the hands of the monks; for they were almost the only persons who could read them. 'Great authors, says *D'Israeli*, 'occasionally composed a book in Latin, which none but other great authors cared for, and which

ting the paper; a pumbeo to point out the beginning and end of each line; a rule to draw lines and divide the sheets into columns; a glass containing sand, and another glass filled with water, probably to mix with the ink."—*Manual of Classical Literature: from the German of J. J. Eschenburg.*

* History of the Book-Trade and the Art of Book-Printing. By *Frederick Metz*. Darmstadt: 1834.

† *Biographia Britannica Literaria*, pp. 35 and 107.

the people could not read.' For these reasons, the small amount of bookselling which took place in the middle ages was solely conducted by monks; and works, being scarce, fetched prices which would astonish the modern bibliomaniac. It is well authenticated that the homilies of Bede, and St Austin's psalter, were sold in 1174 by the monks of Dorchester (Oxfordshire) to Walter, prior of St Swithin's (Winchester), for twelve measures of barley and a splendid pall, embroidered in silver with historical representations of St Birinus converting a Saxon king. At a later period, a copy of John of Meun's 'Romance of the Rose' was sold before the palace gate at Paris for 40 crowns, or L.33, 6s. 8d. A learned lady, the Countess of Anjou, gave for the homilies of Haimon, bishop of Halberstadt, the unheard-of exchange of two hundred sheep, five quarters of wheat, and the same quantity of rye and millet. Among these instances of the high prices sometimes set on unprinted books, we cannot exclude mention of an extraordinary work, which was executed in a singular manner. It consists of the finest vellum, the text cut out of, instead of inscribed on each leaf, and being interleaved with blue paper, it is as easily read as print. The title involves one of the paradoxes in which authors of that age so much delighted: it is 'Liber passionis Domini Nostri Jesu Christi, cum figuris et characteribus nulla materia compositis'—(The book of the passion of our Lord Jesus Christ, with figures and characters composed of nothing). For this singular curiosity the Emperor Rodolph II. of Germany offered 11,000 ducats. As the book bears the royal arms of this country, it is thought to have been executed by some ingenious and patient English monk. We mention the work to account in some measure for the high prices adverted to, which Robertson, in his history of Charles V., adduces as a proof of the scarcity of manuscripts. The truth is, that some copies were intrinsically valuable for the beauty and richness of the binding; and a few others were rendered almost beyond price, from having the relics of saints inserted in them. At a visitation of the treasury of St Paul's cathedral, in the year 1295, by Ralph de Baldock (afterwards bishop of London), there were found twelve copies of the Gospels, all adorned with silver, some with gilding, pearls and gems, and one with eleven relics, which were ingeniously let in to the plates of precious metal that surrounded each page.*

We cannot find that bookselling awoke from its monastic torpor till the establishment of universities in various parts of the continent. But in 1259, sellers of manuscripts, chiefly on theological subjects, became so numerous in Paris, that special regulations were instituted regarding them. Pierre de Blois mentions that they were called librarii or stationarii. The former were brokers or agents for the sale and loan of manuscripts. By stationarii (so called from having stations in various parts of cities and at markets) were meant sellers and copiers of manuscripts, like their Roman prototypes. It appears that at the time the above laws were made, there were in Paris twenty-nine booksellers and book-brokers, two of whom were females. The enormous prices they demanded for their books became a public scandal, and one object of the new law was to regulate their charges. *Taxatores Librorum*, or book-taxers, were employed to determine the price which every manuscript should be charged, that, on the one hand, the stationarii should have a reasonable profit, and that, on the other, the purchaser should not pay too dear.† But the most profitable branch of the trade appears to have been lending books, which were generally so valuable, that for their safe return security was taken. When Louis XI. borrowed the works of Rhases, the Arabian physician, he not only deposited, by way of pledge, a large quantity of plate, but was obliged to find a nobleman to join him as surety in a deed binding him

under a great penalty to restore the book unharmed. Some books were so highly prized, that they were conveyed or pledged as security for loans, as estates are mortgaged. It is recorded that one Geoffrey de St Lieges deposited the *Speculum Historiale in Consuetudines Parisienses* (Historical Mirror of the Customs of the Parisians) with Gerard de Montagu, king's advocate, as security for a sum equal to about L.10.

From these facts, it would appear that bookselling was in Paris—then the chief seat of learning—a profitable calling between the twelfth and fifteenth centuries. They were not, however, the only members of the trade existing in Europe. Wherever universities were established, booksellers also resided, especially in Vienna, Palermo, Padua, and Salamanca. Gradually, 'the trade' spread itself over less learned places; and by the time printing was invented, both librarii and stationarii exercised their vocations in most of the larger European towns.

Such was the condition of the trade up to the year 1440, when it felt the effects of a revolution which shook far more important professions and institutions to their base. About the year 1430 it was whispered in Mayence that one John Guttenberg had invented a process by which he and an assistant could produce more copies in one day than two hundred and fifty of the most expert penmen. The learned were incredulous; but a few years afterwards their doubts were silenced by the appearance of a Bible in Latin—printed from metal types. This wonder was effected by a machine which has since done more for the advance of civilisation than all the other expedients of ingenious man to save his labour, or to promote his welfare—THE PRESS.

MISCELLANEA.

Dr Watt's Abstract of the Glasgow Mortality Bill for 1844 is marked by the usual abundance of valuable statistical information. The population is now estimated at 311,000. The year 1842 was one of extreme commercial depression; but, from the mildness of seasons, and the regulated dispensation of subsistence to the poorest class, exhibited a lower mortality than usual. Commercial prosperity, reviving in 1843, has been at an unusual height in 1844. These preliminary facts will enable the reader to appreciate the results of Dr Watt's inquiries.

It appears that the total burials of 1844 (8092) is a decrease of no less than 2268, or more than a fourth upon the amount of 1843. The baptisms of 1844 are 217 above 1843; the increase of marriages is 598. In 1842, the year of greatest commercial depression, the proportion of marriages to population had sunk to 1 in (nearly) 150. In the improving year, 1843, the proportion rose to 1 in 144 (omitting fractions); in the best year, 1844, it was 1 in 126; showing that, upon the whole population of Glasgow, there is a coincidence between prosperity and the disposition to a matrimonial union. It has been ascertained, however, that the diminution of marriages in bad, and their increase in good times, chiefly obtains in those districts of the city which are the residence of the middle and upper classes. The humbler population marry with less regard for circumstances—a rule, we believe, universal, and the causes of which are not difficult to understand.

The Glasgow bill shows that the amelioration of public health in 1844 chiefly affects the humbler classes. One-half of the decrease of burials is in that class which take place at the expense of the public. During the few by-past years, the humbler people have been in the same circumstances as usual as to their dwellings, the drainage and cleaning of their streets, ventilation, &c. The change has been in the abundance of their means of subsistence. Dr Watt therefore remarks that, while he attaches due importance to the measures in contemplation for improving the health of towns, he is at the same time convinced of the still more pressing importance of measures 'for relieving the wants of the poor and destitute, more especially during times of commercial distress, to prevent disease and death from increasing and spreading with unmitigated violence among them. One inference, he says, 'to be drawn from the facts before us is, that when these wants are supplied, human life, like vegetation, assumes a more vigorous and

† Annals of Parisian Typography. By the Rev. Parr Greswell. London: 1832.

healthy condition during dry and favourable seasons than in others, in defiance of defective drainage."

A system which goes against nature—can such be right in any circumstances; and is not its being against nature its sufficient condemnation? A royal personage of this country has his wife provided for him by the state, and the blessings of heaven are invoked upon a union where the most obvious dictates of heaven are disregarded. Let the reader say if we here speak too strongly, after reading the following account of the first interview between the Prince of Wales (afterwards George IV.) and the lady who had been brought from her foreign home to be married to him. It is from the Diary of the Earl of Malmesbury, who had conducted the princess to England:—"I immediately notified the arrival to the king and Prince of Wales; the last came immediately. I, according to the established etiquette, introduced (no one else being in the room) the Princess Caroline to him. She very properly, in consequence of my saying to her it was the right mode of proceeding, attempted to kneel to him. He raised her (gracefully enough), and embraced her; said barely one word, turned round, retired to a distant part of the apartment, and calling me to him, said, "Harris, I am not well; pray get me a glass of brandy." I said, "Sir, had you not better have a glass of water?" Upon which he, much out of humour, said, with an oath, "No; I will go directly to the queen;" and away he went. The princess, left during this short moment alone, was in a state of astonishment; and, on my joining her, said, "*Mon Dieu! est ce que le prince est toujours comme cela? Je le trouve très gros, et nullement aussi beau que son portrait.*" [Is the prince always thus? I find him, too, very fat, and not at all so good-looking as his portrait.] I said his royal highness was naturally a good deal affected and hurried at this first interview, but she certainly would find him different at dinner. She was disposed to further criticisms on this occasion, which would have embarrassed me very much to answer, if luckily the king had not ordered me to attend him. The drawing-room was just over. His majesty's conversation turned wholly on Prussian and French politics; and the only question about the princess was, "Is she good-humoured?" I said, and very truly, that in very trying moments I had never seen her otherwise. The king said, "I am glad of it;" and it was manifest from his silence he had seen the queen since she had seen the prince, and that the prince had made a very unfavourable report of the princess to her. At dinner, at which all those who attended the princess from Greenwich assisted, and the honours of which were done by Lord Stopford, as vice-chamberlain, I was far from satisfied with the princess's behaviour: it was sippant, rattling, affecting rallery and wit. The prince was evidently disgusted; and this unfortunate dinner fixed his dislike; which, when left to herself, the princess had not the talent to remove, but, by still observing the same giddy manners, and attempts at cleverness, and coarse sarcasm, increased it till it became positive hatred. From this time, though I dined frequently during the first three weeks after the marriage at Carlton House, nothing material occurred; but the sum of what I saw there led me to draw the inferences I have just expressed. After one of these dinners, where the Prince of Orange was present, and at which the princess had behaved very lightly, and even improperly, the prince took me into his closet, and asked me how I liked this sort of manners: I could not conceal my disapprobation of them, and took this opportunity of repeating to him the substance of what the Duke of Brunswick had so often said to me, that she had been brought up very strictly, and if she was not strictly kept, would, from high spirits and little thought, certainly emancipate too much. To this the prince said, "I see but too plainly: but why, Harris, did you not tell me so before, or write it to me from Brunswick?" I replied that I did not consider what the duke (a severe father himself towards his children) said of sufficient consequence; that it affected neither the princess's moral character nor conduct, and was intended solely as an intimation, which I conceived it only proper to notice as his royal highness at a proper occasion—at such a one as now had offered; and that I humbly hoped his royal highness would not consider it as casting any real slur or aspersion on the princess; that as to not writing to his royal highness from Brunswick, I begged him to recollect that I was not sent on a discretionary commission, but with the most positive commands to ask the Princess Caroline in marriage, and nothing more; that to this sole point respecting the marriage, and no other, those commands went; any reflection or remarks that I had presumed to make would (whether

in praise of, or injurious to her royal highness) have been a direct and positive deviation from those his majesty's commands. They were as limited as they were imperative. That still, had I discovered notorious or glaring defects, such as were of a nature to render the union unseemly, I should have felt it as a bounden duty to have stated them; but it must have been directly to the king, and to no one else. To this the prince appeared to acquiesce; but I saw it did not please, and left a *rancore* in his mind."

Fog in a Large City—with what fancy, yet truth, is it described in the following newspaper paragraph! "It has been satisfactorily demonstrated that snow serves to keep the earth warm: and although a fog is not very easily seen through, it appears to us that it is a kind of nightcap which the earth puts on during the day, when the weather happens to be unusually cold. At the moment we write, there are neither ends to the streets nor tops to the houses. Steeples, and monuments, and towers, and chimney-stalks, have gone off in smoke. The sun at noonday is no longer a type of clearness. Everything is a blank. In the centre of the thronged thoroughfares, we are as much out of sight of land as a vessel in mid-ocean. But what strange shapes flit and loom about us! On every side there is a series of dissolving views in continual process of exhibition. Beef-eating compounds of undeniable flesh and blood are threading the mist-like phantoms. We are revelling in a dance of shadows. Whichever way we turn, individuals appear and vanish like witches on a blasted heath. What a phantasmagoria of dim and vapoury forms! What a universal game at blind-man's buff! Strange freak of nature!—a populous city partially stricken with blindness—men's visions contracted to an ell's length—every street a dark passage—everybody cautious and groping. Who's there? No answer. Perhaps a lamp-post—perhaps a pump. What frosted lights are these? Is that a house, a shop, a square, a bridge, or a river? Where are we? Which direction is south, and which north? Is this a man or a minibus? The largest objects are only to be scanned by the touch, as a near-sighted person reads small print with his nose on the paper. Lights, links, and lanterns!—we shall be in the canal! It is plain that man is an imperfect animal, and wants tentacula [it should be antennæ]. There's a horse's head in our neck. We are in the heart of a cloud that, seen afar off, would be sufficiently alarming. What a cover for a retreating army! Stop thief! "That handkerchief did an Egyptian to my mother give!" The thief and the handkerchief, however, are both gone. Two strides, in fact, constitute an *abissi*. Charity is almost at a stand-still, for so dense is the fog, that it is impossible for the left hand to see what the right is doing. We have also been informed of an individual who had been suddenly prosperous in the world, passing through some of the principal streets without recognising a single old acquaintance."—*Glasgow Citizen*.

To vulgar and commonplace minds all things are vulgar and commonplace. Sunbeams strained through them would come out woollen threads. See how this is verified in the following extract from Kohl's Travels in Scotland:—"I was much annoyed that circumstances would not allow me to pay a visit to Abbotsford. "You may make yourself easy about that, sir!" began one of our inside passengers, addressing me, after he had taken off his right leg for greater convenience, and placed it behind him in a corner of the coach—he had a wooden leg, to wit—"make yourself easy about that, sir! There are prettier seats in Scotland than this Abbotsford; and if you have seen Taymouth Castle, Dunkeld, and Dalkeith, you may travel past this comfortably enough. Walter Scott, as I know myself, purchased this house when it was a little farm, upon which at first he built only a very confined and small mansion. The greater his means became, the more he extended his habitation, until it became at length the irregular and wonderful little seat you now see before you. Besides, the house is no longer in the condition in which the Great Unknown, or rather the Great Well-known, left it. More than this; I cannot comprehend how people can be so incredibly curious about *souvenirs* and memorials of Sir Walter Scott. Believe me, sir, people have exaggerated the fame and praises of Sir Walter Scott, as they have exaggerated the fame of other celebrated persons, in an inconceivable manner. Who, then, was Sir Walter Scott? He was clerk to the writers to the signet. Haven't I seen him myself, every other morning, coming out of the Parliament House, or over the hills there? He had nothing of the English gentleman about him—nothing so fine and distinguished. On the contrary, he had

a very plain, common, old Scotch face, little eyes, round, big, thick nose, that always looked as if it were a little swollen. And then he did not look quite so clever as people represent him. His broad, somewhat hanging lips, gave him rather a somewhat stupid appearance. He had, besides, very clumsy feet, and walked a little lame. If any one accosted him, he usually returned a blunt Scottish good-day. 'How d'ye do, sir?' was his usual mode of salutation, uttered in a gruff tone, and laying the stress of the accent on the 'do,' just like the common people. He could not pronounce the 'r' properly, and made something like a 'ch' of it, while he emitted the sound from the back part of his mouth. When he wished to say 'rock,' it sounded almost like 'cock.' In a word, if the good man did not happen to be dead, and could you see him there, walking towards you as I have described him, in his coarse, green old greatcoat, with large metal buttons, which he used to wear at Abbotsford, you would fancy that you were looking at a farmer rather than a poet."

Heroic versus Industrious Policy, is well exhibited in the following remarks from the *Spectator*:—"French statesmen seek to extend the manufactures and commerce of their country, and increase its wealth, with a view to increase its naval and military power. English statesmen seek to render the defensive establishments of their country by sea and land more perfect, in order to protect its manufactures and commerce. The statesmen of both countries direct their attention to the same objects; but what is the means with the one is the end with the other. An interesting paper on the mining statistics of France, by Mr Porter of the Board of Trade, which has just been published in the journal of the Statistical Society, affords an opportunity of contrasting the results of what may be called the direct and indirect processes for increasing national power. A strong steam navy has become an object desirable in both countries. The most important material elements of a steam navy are coal and iron. The French government has set itself with energy to construct war-steamer; and has laboured strenuously, by a system of artificial protection, to increase the internal production of coal and iron, in order that, in the event of war, it might be independent of foreign supplies. The protection afforded to the iron trade of France has been prompted less by a desire to increase the national wealth, than to obtain a home supply of materials for war. Meanwhile the English government, though not inattentive to augmenting its force of war-steamer, has pursued, with respect to the coal and iron trades, a course of policy which had in view solely the general development of the national resources, regardless of their bearing upon our means of defence. While the French government has been hedging its iron trade round with fiscal protection, the English government has gradually been stripping its iron trade of every vestige of protection. The French government, with an eye to contingent wars, has been labouring to insure a stock of warlike materials: the English government, with an eye to turning peace to the best account, has left the day of war to care for itself. The result has been, that in 1841 the quantity of coal raised in this country was at least ten times the quantity raised in France; and that in the same year four tons of iron were made in this country for every ton made in France. The coal consumed in the iron works alone of Great Britain rather more than doubled the whole quantity of coal raised in France. In Great Britain, the average quantity of coal raised within the year by each person employed in coal mines was 253 tons; in France it was only 116 tons. In France, 47,800 persons were employed in producing one-fourth the quantity of iron produced in Great Britain by 42,400. The prices of iron to the consumer in France are from 200 to 250 per cent. higher than in England. France has not even succeeded in making herself independent of foreign supplies: the quantity of coal imported in 1841 was within a trifle of half the quantity raised; and nearly 50,000 tons of British iron were imported, pig-iron being subject to a duty of L.3. 2s. 6d., and plates, bars, and rods, to a duty varying from L.8. 7s. 4d. to L.16. 14s. 9d. Britain, in whose policy war has been scarcely taken into account at all, possesses at this moment a more abundant and cheap supply of materials for its steam navy than France, which, by the artificial encouragement given to its iron manufacture, has diverted industry and capital from other branches of trade, voluntarily sacrificing wealth to increase its warlike force. France has, in consequence, only its royal steam navy to rely upon; while the steam navy of our wealthier traders could, at a short

notice, supply a formidable body of war-steamer. If French statesmen would take a leaf out of the British book, and adopt a commercial policy really and sincerely intended to promote their country's commercial prosperity, without any *arrière pensée* of war, they would find this indirect way of increasing the national strength by far the most certain."

YEARNING FOR WONDERLAND.

[FROM THE GERMAN OF SCHILLER.]

Ah! that I could wing my way
Through earth's valley—deep and dreary—
Ah! that I could float all day,
Pinions never tired or weary,
O'er the everlasting hills,
And the ever-gushing rills,
Where come blight and sorrow never,
Ever green, and youthful ever!

Where Heaven's harmonies resound,
Holy Peace for ever singing;
Where light Zephyr sports around,
Odours from the flower-buds wringing;
Through the trees' dark foliage dancing—
O'er the fruit all golden glancing—
By no wintry blast affrighted—
Kissing the soft flowers delighted;
Flowers that never lose the sun,
Never close the laughing eye;
With existence never done;
Know not what it is to die!

Wo is me! what rolls between?
'Tis a rapid river rushing—
'Tis the stream of Death, I ween,
Wildly tossing, hoarsely gushing;
While my very heartstrings quiver
At the roar of that dread river!

But I see a little boat
The rough waters gently riding;
How can she so fearless float?
For I see no pilot guiding.
Courage!—on!—there's no retreating:
Sails are spread in friendly greeting.
On then, on!—in love we must,
Without pledge or warrant, trust!
The white-armed sails a message bear:
'There are wonders everywhere!
The wondrous faith wherein you stand
Must bear you to the Wonderland!'

January 11, 1845.

E. L.

A NOBLE TASK FOR THE TRUE POET.

And whom shall we look to first but the masters of thought? Surely the true poet will do something to lift the burden of his own age. What is the use of wondrous gifts of language, if they are employed to enervate, and not to ennoble their hearers? What avails it to trim the lights of history, if they are made to throw no brightness on the present, or open no track into the future? And to employ imagination only in the service of vanity or gain, is as if an astronomer were to use his telescope to magnify the pot-herbs in his kitchen garden. Think what a glorious power is that of expression, and what responsibility follows the man who possesses it. That grace of language which can make even commonplace things beautiful, throwing robes of the purest texture into forms of all-attractive loveliness: why does it not expend its genius on materials that would be worthy of the artist? The great interests of man are before it, are crying for it, can absorb all its endeavour, are indeed the noblest field for it. Think of this; then think what a waste of high intellectual endowments there has been in all ages from the meanest of motives. But what wise man would not rather have the harmless fame which youths on a holiday scratch for themselves upon the leaden roof of some cathedral tower, than enjoy the undeniable renown of those who, with whatever power, have written, from slight or unworthy motives, what may prove a hindrance to the wellbeing of their fellow-men?—*The Claims of Labour.*

A FEW DAYS IN A FRENCH CHATEAU.

BY A LADY.

I OFTEN wonder at what has been a thousand times wondered at already—the remarkable resemblance between the course of events in English and French history. A king possessing many good qualities, falling on evil times, is carried by his people to the scaffold. Next follows a pretended republic, which merges in a military despotism. This ends, and then comes back the old reigning family. But this family not conducting itself properly, loses the popular affection, is turned adrift, and a far-off cousin is elected king. To make the parallel pretty nearly complete, the family of the dethroned monarch lives in a distant land, hoping for better times, and retains a hold on the loyalty and compassion of certain old families of distinction, whose feelings cannot brook an unhesitating submission to the powers that be. One thing more, indeed, as respects France is still wanting to render the resemblance complete—an insurrection led on by these old-fashioned loyalists, and fruitless in everything but utter ruin to their expiring cause.

No such mad freak having yet occurred, the legitimists of France, as they are pleased to term themselves, occupy a position parallel with the Jacobites in Scotland and the Cavaliers in England, a short time before their annihilation as a party by the rebellion of 1745. In the same manner that these sturdy Jacobites and Cavaliers used to shun the court of George I. and II., and live in grumbling retirement in their old castles and halls, so do the legitimists of France eschew the court of Louis-Philippe, and shutting themselves up in their chateaux or their town mansions, live but for their families, and dream only of a second restoration. James III. was 'the king over the water,' who, the Cavalier party declared, should one day 'enjoy his own again;' the young Duke of Bordeaux (nominally Henri V.) is the object of veneration among the saddened adherents of the Bourbons.

Visionary as everybody now allows the projects of the Cavaliers and Jacobites to have been, nothing can make me disbelieve them to have been a noble set of men—gentlemen of high principle, brave, generous; their very misfortunes making one almost love them in spite of their manifold errors. Had I lived a hundred years ago, I tressay I should have attended the ball of 'the prince' in Holyrood, at least if so gallant a personage as Fergus M'ivor had asked me. I am certain I should have wept the fate of Lords Kilmarnock and Balmerino and Charles Balcille; and even now I have a degree of tender regard for the 'bonny white rose,' the emblem of the unfortunate house of Stuart. Of such poetical inclinations, it will not be thought surprising that, on a late visit to Paris, with a party of friends, I should have wished to see and know something of the old loyalist families who still cling to the *fleur-de-lis*—the De Sullys, the De

Montmorencys, the De Choiseuls, and other remnants of the shattered noblesse.

In ordinary circumstances it is no easy matter to become acquainted with these families; for they do not mingle much in general society. The few who dwell in Paris reside in the Faubourg St Germain, a *quartier* which has now become synonymous with their party, and the inhabitants of which are associated in the mind with the brilliant court of Louis XIV. The loyalists who have retained their fortunes display their taste for magnificence only in the sumptuous adornment of their palace-like houses, and in the splendour of their equipages. The brilliant *toilette*, so dear to all other Frenchwomen, is by the ladies of these families discarded, and replaced by the neatest and most simple attire. Their manners partake of the same simple character; they are frank, and at the same time polite; merry without being boisterous, and never exacting; for they have been schooled by that best of teachers—adversity.

A previous acquaintance in London with certain members of one of these ancient and noble families, was now fortunately instrumental in bringing us an invitation to spend a few days with them and their venerable relative at their seat in the country; and as life in a French chateau can be but little known in England, I propose—adopting, as may be supposed, fictitious titles—to attempt a sketch of what fell under our observation at the chateau of our new but valued friend.

The Comte de Beaulieu, one of the sons-in-law of the nobleman to whose country house we had been so hospitably invited, offered to come to Paris to escort us to Linière; but this stretch of politeness we positively declined, and only would consent to meet him at Versailles, where we intended to remain for a few days previous to quitting France. Behold our party, then, at Versailles, where on the appointed day the comte made his appearance; and after an interesting stroll with him through some of the private apartments of the palace, to which he had special access, we set off for Linière early in the afternoon, and under as bright a sun as ever shone on la belle France, being preceded by the comte, who drove an elegant open carriage, built from a design of his own, and drawn by a pair of fine English bay horses. The excursion was short and delightful. Passing through a district of country tolerably wooded, we had here and there a glimpse of an old chateau, whose white walls contrasted finely with the bright green of the trees which surrounded it, and were thus prepared for what we might expect at the conclusion of our drive. On we went, and in about two hours arrived at the park gates of Linière. At the head of an avenue of trees stood the mansion, a fine pile of building, with a spacious flight of steps in the middle, from the top of which, on each side, branched off a terrace with a balustrade of stone running across the front

of the chateau. The steps at both sides were flanked by quantities of geranium and other fragrant plants in full bloom, which imparted an air of elegance to the scene.

At our near approach, the venerable master of the house, the Marquis de Tourville, accompanied by another of his sons-in-law, the Vicomte de Saint Prosper, descended the steps where they had been waiting some time. The truly hospitable and kind manner in which we were thus welcomed, could only be equalled by that which we experienced from the ladies, when a few moments after we arrived at the vestibule, where they reiterated the same kind expressions in the most engaging manner. We then walked through the antechamber and billiard-room into the drawing-room, where we chatted for a short time, and then adjourned up stairs, preceded by the Marchioness and the Countess de Beaulieu, who pointed out our individual apartments, and quickly retired, warning us that we had not much time before dinner for the duties of the toilet. In a short time the great dinner bell rung, and when the ladies tapped at our door to conduct us to the drawing-room, we were not quite prepared to descend. When we made our appearance in the drawing-room, we found all the family assembled; therefore, whilst waiting for the announcement of dinner, let me describe our host, hostess, and family. The marquis numbers more than seventy years, although he does not appear so old: from his military bearing, no portion of his height is lost, and this, combined with an aquiline nose and eagle eye, give him such an imposing presence, that one cannot approach him without feeling a degree of awe. From infancy he had been in attendance upon Marie Antoinette, as his family was one of those who enjoyed the intimate acquaintance of that unfortunate queen.

The marquis in early life joined the allied army, and is linked in the dearest bonds of friendship with some of our brave old generals with whom he had served. After the Restoration, he was reinstated in his former rank and position, and succeeded in regaining a great part of his fortune. When Charles X. ascended the throne, he was intrusted with a high and responsible command of great honour, which he filled up to the moment of the Revolution. He has ever since lived apart from the court, and never takes his seat in the Chamber of Peers unless some question involving the vital interests of his country is to be agitated. The marchioness is the descendant of one of the most renowned families in France: her mother and grandmother both perished under the guillotine. She has passed middle life, is peculiarly graceful both in person and manner, has a sweet but sad expression of countenance, and in youth must have been beautiful. She dresses to perfection; never tries, by any youthful denudings, to take one year off her age; and wears her own nice gray hair. Her family consists of three daughters, who are all married. The eldest, the Countess de Beaulieu, always resides with her parents; she is an elegant, self-possessed, intelligent woman, with a very engaging expression, and excels in music and painting. She has six children. The comte, who is the heir of a house as ancient as that of his wife, is a handsome, dark-complexioned man, and highly accomplished. The youngest daughter, who was staying here, resembles a lovely young Englishwoman: she is a beautiful blonde, and is married to the Vicomte de Saint Prosper, eldest son to the Duke de Saint Prosper, with whom they reside nine months every year, the other three being passed at Linzière. The vicomte is a tall, handsome, fair-complexioned man, and so much like a John Bull, that he has frequently been mistaken for an Englishman. They have also six children.

On dinner being announced, the marquis politely offered one of us his arm, with the air of an old cavalier, and the rest of the company followed. According to French custom, the host and hostess sat at opposite

sides of the table, on which the display was simple and tasteful, the eye being feasted as well as the palate. I was particularly struck with a large and handsome basket occupying the middle of the table, and filled with the most beautiful flowers. As soon as the soups were despatched, and the covers removed, an immense joint of roasted beef, as a compliment to us, stood revealed, towering over all the delicate dishes. After three courses, which would have done credit to Ude himself, the table, with the cloth still on, was replenished with the most delicious fruits, sweetmeats, and iced creams.

The conversation during dinner, which lasted about two hours, was lively and entertaining. A number of merry stories were related of the mistakes made by English people in France, and *vice versa*; indeed the Comtesse de Beaulieu told some very laughable anecdotes of her own experience in London. After finger-glasses were handed round, we were all escorted back again to the same order to the drawing-room. On the way, we saw eight lovely little girls, all dressed alike, playing in the billiard-room. They accompanied us into the drawing-room, and as soon as coffee was dispensed, the party quickly broke into little social knots. Music, conversation, and looking at the gentlemen playing billiards in the adjoining apartment, made the evening pass most agreeably. When the drawing-room was lighting up, a new contrivance struck us as having a pretty effect. Two brilliant lamps were placed in superb china vases on each side of the mantel-piece, throwing down a light upon a pyramidal stand of flowers, which entirely concealed the fireplace. Tea was served at a late hour. The marquis told us that, although they always had this beverage in Paris, they had not yet habituated themselves to it in the country. Tea, indeed, is still a rare luxury among the French.

We had been so long accustomed to the narrow and uncomfortable beds in French hotels, that when, on having retired for the night, we sunk in capacious down couches, with linen akin to cambric, and pillows trimmed with fine lace, we could scarcely credit our senses that we were really in France. We arose early to enjoy the delightful view from our windows. The beautiful park, studded with lofty clumps of trees, reminded us of merry England. At eight o'clock the waiting-maid of the marchioness brought in a large tray covered with a napkin, upon which were placed tea, coffee, hot rolls, butter in curious devices covered with pieces of ice, and sundry kinds of cakes quite hot. The cups and saucers were each ornamented by a marquis's coronet, and were of the finest Sèvres china. The entire establishment being conducted by many servants, with the exception of the respective waitresses and nursery attendants, was the reason that the marchioness, in consideration of our English prejudices, was so kind as to let her own maid bring in our breakfast; which we enjoyed very much.

Fain would we now have rambled about the grounds, but, knowing that it is customary for the ladies to stay in their own rooms until the bell for the *grand déjeuner*, or general breakfast, summons all the family, we constrained ourselves to conform to the rules of the house. By adhering to this plan, each separate family is enabled to make their own private arrangements, and give their orders for the day, the remainder of which they spend together free from household cares. The ladies have each a cup of coffee at eight o'clock, or earlier, and the gentlemen also when they are indisposed, but not otherwise. Prevented from going out, we took the opportunity of taking a look round the apartments allotted for our use. Our bedrooms were very large, carpeted all over, and superbly furnished with footstools, arm and small chairs, sofas, marble-topped cabinets, chests of drawers, dressing-tables, and last, but certainly not least in our estimation, capacious mahogany bedsteads, terminating at each end in Greek scrolls, and provided with two sets of curtains, appended to a gilt coronet fastened into the wall, the outside hangings light-coloured silk, to match the window-curtains, the inside ones fine

clear white muslin. In the centre of each bedroom stood a library table, furnished with writing materials, matches, wafers, almanacs, wherein the saints' days were peculiarly notified; and these articles complete the list, with the addition of hanging pin-cushions at each side of the large looking-glass which stood on the mantel-piece. Attached to each sleeping apartment was a handsome dressing-room, leading to another small apartment designed for a waiting-maid, from which there is an exit to the corridor. Each visitor therefore may be said to have a cluster of two or three private apartments. The other parts of the mansion are on the same princely scale. It was built in the reign of Louis XIII., and consists of a centre two storeys high, with a wing at each side of the same height. Staircases lead to the long corridors, which run from one end of the chateau to the other, and from which all the bedrooms are entered. The lower corridor is hung with family portraits—knights and belles of 'high degree'—and is lighted by the windows which form part of the façade. The lower floor of one of the wings contains the suite of rooms appropriated to the marchioness, the other those of the marquis, and the entire upper part of each is occupied by the children, their servants, and English governesses. The drawing, billiard, and dining-rooms are noble apartments, and, with antechambers, run the full length and breadth of the chateau. In one of the drawing-rooms is placed a marble bust of the Duke de Bordeaux, in a most conspicuous position. It is valuable both as a likeness, and as a fine work of art. Luxury and comfort are singularly combined in this charming room, from which the grounds can be entered by means of a flight of steps.

The ladies had the kindness again to call at our door, to convey us down stairs as soon as the bell rang for breakfast. We found all the family assembled in the drawing-room. Some of the gentlemen had been walking in the grounds, others in the village, and the intellectual comte had been giving his accustomed German lessons to his daughters. We were all conducted in the same order to the dining-room as we had been in the preceding evening. We found the beautiful polished table covered by a delicious mélange of poultry, joints of roasted meat, bread, cakes, potatoes in divers forms, and most recherché made dishes. Tea, coffee, and chocolate were poured out from silver pots by servants at each person's desire, the cups and saucers alone being laid on the table. Eggs, poached and dressed in oil, were found to be delicious: they were, however, served only in small earthenware pipkins with handles, which certainly appeared rather incongruous amongst such a brilliant display of plate. Sweetmeats of the rarest and most curious description, strawberries, cherries, and various fruits, some of them iced, were also present; likewise wines and liqueurs—the whole reminding me of the far-famed breakfasts of the Scotch. The absence of a table-cloth, however, gave a foreign air to the repast. After-glasses, as at dinner, was the signal for rising from table, when we were again marshalled to the drawing-room, where all the children were assembled, preparing to their walking out. They breakfast at half-past seven o'clock, and have all their lessons over by eight, after which they take exercise and dine. Music, singing, and different kinds of needlework occupy them till five o'clock, when they take some light supper, appear in the drawing-room, after their parents' order, for about an hour—a custom which is infinitely contrary to the English habit of admitting a troop of children into the dining-room during the dessert. Having settled ourselves in the drawing-room, some of the party sat down to embroidery, and others to sewing, the table being covered with newspapers just brought from Paris; whilst we visited by invitation the apartments of the marchioness, which, as before mentioned, occupy all the ground-floor of the left wing. I entered her library from a door in the drawing-room leading into it, and were much pleased to find such a choice collection of French translations of Eng-

lish works, as madame cannot read them in the original. Sir Walter Scott's works occupied a large space. We were much amused, on opening one of his novels, by seeing an attempt at a translation of Edie Ochiltree's Scotch; and a very queer attempt it was. In a recess stood a handsome bedstead, draped with pale blue *gros de Naples*, covered by the most beautiful and delicate lace-work of that species called *application*. The coverlet and toilet-cover were likewise of the same material; the former was flounced round in a corresponding pattern. All these elegant specimens of needlecraft have been the result of the marchioness's own industry. In the middle of a large bow-window stood the toilet-table, covered by a profusion of silver, gold, china, Venice glass, and coloured stone dressing utensils. Near the fireplace is hung a rosary, in a glass-case, which was pointed out to us with pride and veneration, as it is believed to contain a piece of the true cross. The beads are formed from precious stones. This interesting object was presented to an ancestor of the marchioness by the celebrated Père Joseph, the friend and agent of Richelieu.

The gentlemen and the marchioness having proposed a walk through the grounds, in order to show them to us, we readily assented, and were greatly pleased with the excursion. The walks were diversified, and so well laid out, that from different points of the higher grounds we had charming prospects of the country around, including the old village and church of Linière. Finally, we visited the orangerie and hothouses, and were then conducted by the marchioness to her favourite spot, laid out to resemble, and called an English garden. She showed us a small parterre of pretty Scotch roses, which had been sent her as a present from the venerable Lord Lynedoch, a brother in arms of the marquis. We had scarcely returned to the house, when we were told to prepare for a drive, as they wished us to see some of the neighbouring chateaux. When we were ready, three handsome equipages drove up—a caleche, Brougham, and the Comte de Beaulieu's favourite, each drawn by a pair of fine English horses. We visited two chateaux. One of these contained a rare collection of paintings by the old masters, hung in a gallery evidently copied from the Louvre. The luxury of everything there was regal. Precious bronzes and antique marble busts were distributed through the apartments. The dining-room was worthy of Lucullus. The house had belonged to one of the ancient noblesse, whose widow, after his decapitation, had been obliged to sell it for a trifle to a citizen. This man had a daughter, in whom all his wealth centered; she married a young member of the old aristocracy, and is now a widow with two children. Some years back, her husband was sent as ambassador to England by Louis XVIII. We were particularly struck by the sofas with awnings dispersed through the grounds, and by an octagon room, some of the windows of which opened upon the lawn; they had also awnings over them, and at each side of the steps flowers in vases. A beautiful ornamented cottage in the grounds was most tastefully furnished, and would make a charming summer abode. The riding-house and some of the stables are built with the stones which once formed a part of the celebrated convent, the 'Port Royal,' where the virtuous Arnaulds flourished so long, both as reformers and as the great supporters of Jansenism. At the other chateau the garden pleased us most. The noble duke who is the proprietor seldom visits it; therefore it presented a very different appearance from the one we had just quitted. On our return we entered a very ancient church, with most exquisitely painted windows. Madame de Beaulieu was much pleased at her eldest daughter, nine years old, being able to recognise and narrate the different Scripture histories set forth thereon. As soon as we arrived within sight of the great altar, all our friends, gentlemen as well as ladies, dropped upon their knees, and appeared for some minutes to be lost in devotion. After a delightful drive, we returned to Linière just in time to dress for dinner.

As I have now detailed our proceedings for one day, it would be only a vain repetition to continue to do so, as nearly every hour was spent much in the same manner, with some exceptions; as, for instance, when the day was wet, we each took our work and had some interesting conversation. The marchioness was engaged upon the finest piece of needlework we ever saw, which is intended as a cover for the great altar in her own church at Linière. Every day, after our first breakfast, we read until the general one, always over night providing ourselves with the books which we desired to peruse. During a morning excursion we visited the ruins of one of the strongholds of the bold Jean de Montford, Duke of Brittany, celebrated in one of the ruthless wars of the fourteenth century.

During our stay we had many animated discussions relative to the difference both in manners and customs of our respective countries; but they all ended, as such conversations generally do, by leaving each individual wedded to the opinion expressed at first. One part of French chateau life had for some years puzzled us, but we think we understand it now; I allude to the harmonious manner in which many branches of one family reside under the same roof. The Marquis de Tourville, one day when speaking on this subject, said he rejoiced to entertain us at his chateau, that we might witness the patriarchal manner in which he lived with his daughters and their husbands and children, among whom never a jar occurred. I am inclined to ascribe this felicity to the strict etiquette and habitual politeness of the French. Although all relations, and living together in one house, each branch keeps itself to itself, and no one takes undue liberties with another. I observed that the two sons-in-law of the marchioness always addressed her as *maman*, or *ma chère maman*. One tolerably obvious reason for this clubbing together of families is narrowness of fortune. It will also be recollected that, by the new law of inheritance in France, properties are divided equally among the children, and all seem to maintain an equal hold on the paternal feelings. While acknowledging that this practice of equal division seems the most reasonable and just, I have, after all, doubts of its general efficacy. It no doubt appears scandalous, that, by our law of primogeniture, while the elder son gets all, the younger sons get nothing; yet it causes universal exertion, and is probably best for the nation at large. Few things are more striking to a stranger in France than the hosts of genteel idlers everywhere—men waiting for slices of their fathers' fortune; and it would not, I think, improve society in England to fill it with such a class of persons. I am, however, no politician, and speak diffidently on a question of such moment.

At the chateau, a German gentleman had been invited to meet us, and to remain for some days, as he had the reputation of speaking English fluently. When this worthy man, however, was placed next one of our party at dinner, not a word could he muster in our language; and he appeared to discover for the first time that reading and speaking a foreign tongue are two separate things. He, however, conversed fluently in French; and being a very well informed man, we considered him a great addition to our little society. He bore the jokes passed upon his failure of English with much good humour. The perfect harmony which prevailed in this family was delightful to witness. The venerable marquis was considered by the children as common property during the hour they remained in the drawing-room after dinner. One beautiful urchin climbed his knee; a little girl seated herself on the other; one pulled his hair; another mounted on his back: in fact, he resembled Gulliver when the Lilliputians covered him all over. The parents were likewise besieged; but the instant the time for going to bed arrived, there was no hankering, no shuffling, to gain half an hour. Strict obedience was demanded, and, I must say, cheerfully paid. The Comtesse de Beaulieu's two eldest daughters played the piano remarkably well. The second, who is only eight

years old, is quite a musical genius. Both conduct themselves like women. They asked us such intelligent questions relative to our country, which they are most anxious to see, that it was a pleasure to answer them. They both speak and write our language correctly. The young vicomtesse has two lovely little boys who were beginning to lisp English; and from what I saw and heard here and elsewhere, I should imagine the time is not far distant when every one among the higher classes in France will be able to speak English as well as ourselves. The constant intercourse with England and America is forcing on this result.

I am now brought to the conclusion of my visit. The day of our departure from this charming mansion arrived, and we were obliged to bid adieu to our friends, whom we quitted with much regret, mingled with gratitude, for the very kind and hospitable manner in which we had been treated during our stay in the chateau.

'THE TRADE'

SECOND ARTICLE.

BOOKSELLING AFTER THE INVENTION OF PRINTING.

SOME time between the years 1430 and 1445, there lived in Mayence a rich goldsmith, whose name was John Fust or Faust, the first man who sold a printed book. His name has always been associated with that of Gutenberg and Schoeffer as one of the *inventors* of printing; but, as is reasonably to be inferred, erroneously; for in all the evidence with which the annals of typography supply us, he appears as the capitalist by whose pecuniary advances Gutenberg was able to bring his art into practical operation. Having vainly endeavoured to produce good print in Straasburg, after expending a fortune, Gutenberg returned to his native town, Mayence, and opened his mind to Faust. The goldsmith—manifestly a shrewd man of business—saw, from the progress his fellow-citizen had made in his new method of producing books, that the thing was likely to turn out a good speculation, and warmly embarked in it. A partnership was speedily entered into, and in 1445 a printing-press was set up in Mayence, for taking impressions from the wooden blocks with which Gutenberg commenced his art. The goldsmith and his associate worked in secret, and for some time without success; till Peter Schoeffer, an illuminator of manuscripts, and a confidential person in their employ, hit upon the expedient of making moveable metal types by means of punches and matrices. Faust was so delighted with Schoeffer for his ingenuity, that he not only took him into partnership, but gave him his daughter in marriage. This happened in 1452. Much patience and capital were expended even after this advance in the art made by Peter Schoeffer. The first book they tried the new system on was the Latin bible, and before twelve sheets of it had been printed, Gutenberg and Faust had expended upwards of 4000 florins. Still they persevered, and after three years of laborious exertion, the bible was completed.* A good number of this—the first of all first editions—having been struck off ready for the market, the next thing was to devise means for disposing of them, and it was determined that Faust should travel with copies, *calling them manuscripts*. 'It is certain,' says Lambinet, 'that Faust, Schoeffer, and their partners, sold or exchanged in Germany, Italy, France, and the most celebrated universities, the books

* This bible—the first perfect printed book which ever was issued—was a folio, in two volumes, consisting of 637 leaves, printed in large Gothic or German characters. It has no date, and is known by biblioplists as the 'Mazarine bible,' a copy of it having been discovered, long after it was printed, in the library of Cardinal Mazarine, in the *Collège des Quatre Nations*. Several other copies have since turned up. It is executed with wonderful accuracy and neatness, considering it was the first specimen of the press.

which they had printed.* This was a matter of very great difficulty and delicacy. The process by which the books were produced was a secret, which every person whom Guttenberg or Faust took into their employ was bound by oath not to divulge; to say that the bibles were produced otherwise than by the usual plan, would have partly divulged the secret, and it was for that reason that the whole of their work was executed in exact imitation of writing. The bible was printed on parchment, the capital letters illuminated with blue, purple, and gold, after the manner of ancient manuscripts, and they were sold as such at manuscript price—namely, sixty crowns.

About the year 1463, Faust set out on a bookselling expedition through Italy, Germany, and finally to Paris, with a stock in trade, consisting chiefly of bibles and psalters. In each place there is every reason to believe he not only busied himself in selling his bibles and psalters, but organised agencies for the sale of his wares in his own absence. Having disposed of as many of his folios as he could to the Parisians at sixty crowns, he—unwisely perhaps—reduced their price, first to forty, and then to twenty crowns. This naturally excited the apprehension and the ire of the *libraires* and scribes, of whom Paris was at that period the head quarters, there being no fewer than six thousand persons who subsisted by copying and illuminating manuscripts. It was not in nature that this large and important body—who held their privileges under the university—should sit tamely by and see a man selling for twenty crowns what they got from sixty to a hundred for. The rapidity with which Faust produced his pseudo-manuscripts, so as to supply the constant demands which his low charges produced on his stock, gave rise to a suspicion that he dealt with the Evil One. This suspicion was strengthened when the transcribers—who were principally monks—set about comparing the various copies of Faust's bibles. They found a degree of resemblance in each of the books—even to the minutest dot—which they concluded could only have been produced by supernatural means. The enmity of the scribes against Faust as an underselling bookseller now threatened to become a religious persecution. The fraud once discovered, however, Faust's case was taken up by the civil power, and he was obliged to fly from Paris, to escape the officers of justice. He returned to Mayence, but found no rest there; wherever he had sold his books, he had of course practised deception, and the agents of justice were equally clamorous for him in his native town. He withdrew to Strasburg.

In the meanwhile, Mayence was taken by storm by Adolphus of Nassau. By this event Faust and Schoeffer's journeymen were dispersed, and deeming themselves absolved from their oath of secrecy, they carried the invention into various parts of Europe, many of them setting up presses of their own. Then, and not till then, Faust made a merit of necessity, and wrote and circulated a work in which he described the whole process by which his books were executed. That there should be no further doubt or ambiguity as to whether the productions of himself and partners were manuscripts or print, he placed at the end of his little book the following colophon or inscription:—'This present work, with all its embellishments, was done, not with the pen and ink, but by a newly invented art of casting letters, printing, &c. by me, John Faust, and my son-in-law, Peter Schoeffer, in the famous city of Mentz upon the Rhine.' In this, as in every other instance, honesty proved to be the best policy; for now that Faust had cleared up the mystery, he was no longer pursued as an impostor; and ultimately we find him in 1466 in Paris, making arrangements for establishing a permanent agency for the sale of the productions of his own and his son-in-law's press. This, as we shall presently see, he effected. In the midst of his labours, however, death overtook

him. In that year the plague raged in the French capital, and John Faust fell a victim to it, far away from his home and his friends.

Such is a bare outline of the career of one of the parents of printing, and the sole father of modern book-selling. John Faust (otherwise John *Hand*) was the very reverse of such a necromancer and personal friend of the Evil One as tradition and error have succeeded in picturing him. The truth is, he is often confounded with Jean-Frederic Faust, a charlatan and almanac-maker, who lived about a century after the goldsmith's death, and upon whose history Goëthe, the German poet, constructed his celebrated play. Nothing could be more opposite than the characters of the two men: the one a plodding, yet withal liberal and far-sighted tradesman; the other a quack, but one, we may mention, not quite unconnected with the mysteries of the book-trade. To insure his almanacs a large sale, he advertised them as having been annually dictated to him by Beelzebub. The confounding of the two men took its rise most likely from the cunning of the monks, after the Reformation; of which, there is no question, the diffusion of the bible, by means of the press, was the primary cause. They therefore owed John Faust no good-will for the part he unwittingly took in destroying their system, and tried to defame his memory by mixing up his life with that of a mountebank.

The venerable goldsmith, printer, and bookseller, did not depart this life till he had placed the Paris agency on a secure footing. The name of the agent he employed was Herman de Statten, and the agency was carried on at the house of one John Guymier, as we learn from a curious document found in a copy of Faust and Schoeffer's edition of the Latin bible. It is a deed of sale of the book to Tourneville, bishop of Angiers, and runs thus:—'I, Herman, a German, workman of the honest and discreet John Guymier, sworn bookseller of the university of Paris, acknowledge to have sold to the illustrious and learned master William, of Tourneville, archbishop and canon of Angiers, my most respectable lord and master, a bible, printed at Mentz (Mayence) upon vellum, in two volumes, for the price and sum of forty crowns, which I have absolutely received, which also I ratify by these presents, promising to abide by the same, and guaranteeing my lord, purchaser of the said bible, against any one who would dispossess him. In ratification of which I have hereunto affixed my seal, this 5th day of the month of April, in the year of our Lord M.CCCCLXX. Herman.* By this we perceive that since they first came into Paris, the printed bibles were elevated in price.

It happened, unfortunately, that Herman de Statten failed to obtain any legal instrument of naturalisation in France; and when he died—which he did a few years after his master Faust—his effects were confiscated as the property of a foreigner. The books intrusted to him by Schoeffer, and amounting in value to 1100 francs, were included in the confiscation. Schoeffer, however, obtained restitution through the liberality of Louis XI. It is a striking illustration of the value and scarcity of money at that period, that the king of France found it inconvenient to pay the sum—equal only to L.45, 6s. 8d.—at once; but did so in two yearly instalments!

The distribution of Faust, Schoeffer, and Company's workmen at the siege of Mayence in 1462, began by this time (1470) to operate throughout Europe, by supplying printers to various continental cities. At this early time most printers sold their own books; and if we state the different periods at which printing was introduced into various countries, we shall show also when books of print began to be sold in each place. The first introduction of this invention into Italy was at Subbiaco, in 1465; into Paris, in 1469; into England (Westminster), in 1474; into Spain (Barcelona), in 1475; into Abyssinia, in 1521; into Mexico, in 1550; into the East Indies (Goa), in 1577; into Peru (Lima), in 1586;

* *Recherches sur l'Origine de l'Imprimerie*—[Researches on the Origin of Printing].

* Dr Dibdin's *Bibliotheca Spenceriana*, vol. I. page 16, note.

into North America (Cambridge, Boston, and Philadelphia), in 1640. One of the most active of the German printers and booksellers, between 1473 and 1513, was Ant. Kober, at Nuremberg, who had 24 presses, and nearly 100 workmen in his employ, and kept open shops at Frankfort, Leipsic, Amsterdam, and Venice, all conducted with the greatest regularity and order. He had on sale not only works of his own publication, but also works of other publishers. At Ulm and Basle there were likewise several booksellers carrying on an extensive trade. The many pilgrimages (Wallfahrten) to holy places in the interior of Germany—which were then as much frequented as the sacred shrines in India, and are so still in some Roman Catholic countries—offered them good opportunities for disposing of their books, particularly of those having a religious tendency, which were printed on cheap linen-paper, instead of the expensive parchment formerly in use.

Wherever we turn, we shall find that, once introduced into a country, the press was kept in extraordinary activity, and books were spread in all directions. There were in England, from the time of Caxton to 1600, no fewer than three hundred and fifty printers. Ames and Herbert have recorded the titles of ten thousand different works printed here in the same interval; the yearly average number of distinct works issued and sold in the hundred and thirty years was seventy-five. The number of copies of each was, however, in all probability small, for the early booksellers were cautious. Even Grafton only printed 500 copies of his complete edition of the Scriptures (that of 1540); and yet so great was the demand for the English bible, that there are still extant copies of 326 editions of it which were printed between 1526 and 1600.

In Italy the works of the old classic Roman authors were rapidly printed, when means for doing so were introduced. In Switzerland, especially at Geneva and Basle, a great number of books, chiefly of a religious character, were printed and sold immediately after presses were set up. Indeed the trading talent of the Swiss manifested itself in the beginning of the sixteenth century very prominently in reference to books, for they supplied booksellers even to Germany—to which we must now return.

In the dawn of literary commerce, wholesale trade, in whatever article, was chiefly conducted at fairs, which took place once, twice, or thrice a-year. To these great meetings manufacturers and agriculturists brought such produce as was not of a perishable character, and which was purchased by retailers, who either came from different parts of the country, or employed local agents to purchase on their account. Amongst other manufacturers, the printers brought their goods, which were bought by retailers, and distributed by them throughout the country. At first the greatest quantity of booksellers' stalls was assembled at the Frankfort fairs, where multitudes of strangers and merchants met. Ant. Kober of Nuremberg, Ch. Plantin of Antwerp, and Stephanus (Etienne) of Paris, are recorded as booksellers visiting the Frankfort fair as early as the year 1473. From this period Frankfort gradually became the great book-mart. In 1526 Christopher Froschauer, from Basle, wrote to his principal, Ulrich Zwingli, informing him of the rapid and profitable sale of his books at Frankfort, to persons who had sent for them from all parts. In 1549 Operin of Basle, publisher of the classics, visited Frankfort, and made a profitable speculation. At this period appeared Luther, the great champion of the Protestant world, protesting loudly and openly, both in speech and in writing, against the many abuses that had crept into the church of Rome; and the great cause of the Reformation, while it derived great assistance from the printing-press, repaid this benefit by contributing largely to its development and extension. Saxony, with its enlightened universities (Wittenberg and Leipsic), now became the seat and central point of free theological discussion and investigation, and the booksellers soon found it worth their while to visit also the Leipsic

fair. Besides, the literary intercourse in that country was free and unfettered, whilst at Frankfort it had to contend, in later years, with several difficulties, arising from the peculiar situation of a smaller state, and the restrictions and vexations of an Imperial Board of Control (Kaiserliche Bücher Commission) established by the German emperor, through the influence of the Catholic clergy. Archbishop Berthold of Mayence had previously (in 1486) established a similar censorship in his dominions. The chief object of that board was to watch and visit the book-shops—which, in Frankfort, were all situated in one street, still called the Buchgasse—seizing forbidden books, claiming the seven privilege copies ordered by law to be presented to the universities, and, in fact, exercising the power of a most troublesome police. Against this the booksellers often remonstrated, but without success.* At length the principal part of the book-trade withdrew to Leipsic, where general fairs were held thrice every year, and where—next to Frankfort—the greatest number of books was sold.

The earliest accurate information obtained respecting the sale of books at Leipsic fair refers to 1545, when we find the printers Steiger and Boskopf, both of Nuremberg, repairing thither with their 'wares.' A few years later, the fame of this market as a place of sale for books spread over the rest of the continent, and in 1556 it was visited by the Paris bookseller Clement, and in 1560 by Pietro Valgrisi from Venice. From the accidental mention of these visits and names in the annals of the Leipsic fair, we may infer that booksellers from other parts of the world also frequented it habitually, although no record of their presence has been made. The different languages which they spoke had little effect upon the sale of their books, the greater part of which, wherever printed, was in Latin. In 1589, the number of new works brought to Leipsic was 362, of which 246, or 68 per cent., were in the Latin language. The literary tastes of that time may be guessed from the fact, that of the whole number of these literary novelties, 200 were on theological subjects, 48 on law and jurisprudence, and 45 on philosophy and philology.

The trade in books carried on in Leipsic increased so rapidly, that it banished traffic in other articles from the fair. No fewer than fourteen printers and booksellers had, by 1616, taken up their residence in the city. The names of these individuals have become dear to the modern bibliomaniac, from the rarity of the works bearing their respective imprints.† These 'publishers' (for by this period the wholesale bookseller was distinguished from the retailer by that expression) brought to the Easter fair of 1616 no less than 153 new works, the productions of their own presses. Of other publishers in various parts of Germany, eight resided at Frankfort-on-the-Maine, seven belonged to Nuremberg, four to Jena, three to Ulm, and the same number to Hamburg; Wittenberg, Strasburg,‡ Gotha, Cologne, Breslau, had each two, and Lübeck, Golar, Heidelberg, Rostock, and Lüneburg, one.

The Easter fair held at Leipsic was now exclusively devoted to books. The booksellers had already organised a system, by which they were enabled to print a catalogue of every new work that was to be sold at the fair, so that purchasers had no difficulty in making their selection; and Leipsic Easter fair became the great book-mart for the whole continent.

Having brought our notices of 'the trade' in Germany down to that great era in its existence, the establishment of the Leipsic book-fair, and in England to the unhappy time when our country was torn by civil war, and the book, with all other trades, was in a struggling and depressed condition, we shall, in succeed-

ing articles, offer some interesting facts concerning the modern system of bookselling, as practised in various countries where any very considerable literary commerce is carried on.

THE LOST NEW-YEAR'S GIFT.

BY FRANCES BROWNE.

It was the last day of the year—the last dress of Lady Fitzalbert's costly mourning had just been finished, and the working girls of one of the largest millinery establishments in London were dismissed to seek their distant homes at three o'clock on a December morning. The frost was clear and keen, and the wind, which swept through the now silent and deserted streets, sent a chill to the hearts of that worn-out company, as on they passed by many a noble mansion, and many an ample warehouse. None spoke, for they had talked themselves out in the workroom; none looked up, though the London sky was for once without a cloud, and the stars were shining there as they shone when London was a forest. But heart, and brain, and eye had been exhausted by two days of continued labour, and they thought of nothing but hurrying home to sleep. One after another parted from the group with a murmured good night, as they reached their respective dwellings, till at last none was left but Lucy Lever, whose home happened to be the most distant of all.

Lucy was a young and beautiful girl of eighteen, whose bright blue eyes, golden hair, and fair transparent complexion, might have graced a prouder station. She was the daughter of a poor country tradesman, who had some years before removed to London with his family, in hopes of bettering their fortunes, but died soon after of one of those fatal epidemics which so often visit the poorer habitations of our large towns. The mother had struggled on, through poverty and toil, to have her eldest girl instructed in needlework, and to maintain two younger daughters; but a severe attack of rheumatism, which at length became chronic, had totally unfitted her for her laborious employment as a washerwoman, and the whole burthen of the family support fell upon Lucy, whose small earnings were barely sufficient to keep them from absolute want.

They had one friend in London, the sister of Lucy's mother, who was married to a small shopkeeper, accounted rich among his class; but, like too many of the rich in every class, possessed of a griping and covetous disposition. They had no family, and the man's affections turned so much on saving, that it was only by stealth his wife could afford any little assistance to the pinched and poverty-stricken household of her sister. This, however, she did at times, particularly to Lucy; for the childless woman was much attached to her beautiful niece, and had lately given her the present of a crown to buy what she liked best as a New-Year's gift.

Lucy had not seen so much money to call her own for many a day, as the pressing wants of the family required every penny as soon as it was earned. The crown was therefore carried home, and shown in triumph to her mother, who agreed it would be very useful, but advised Lucy to take it in her pocket to the workroom, that the girls might see she could have money about her as well as other people. She had done so; and now, cold and weary as she was, the young girl could not help taking out her prize to look at it, and thinking how much it would buy, to beguile the way. Ah! blessed power in the heart of youth, to draw streams of joy and comfort from the first mossy rock it can find in the desert of life! Time may have bright things in store for those who outlive the early darkness of their destiny, but never can bring back the dews of that clouded morning, or the greenness of those blighted springs.

Lucy Lever was but a poor dressmaker's girl; yet she found more pleasure in contemplating that crown than many a monarch can gain from his, as she thought how,

after purchasing a cheap shawl for her mother, and pinafores a-piece to the little girls, something might be saved to buy a watch-ribbon, or peradventure a pocket-handkerchief, for William Seymour, a young man of her own station, who had given her a pair of gloves last New-Year's day. They had been long acquainted, and report said there was a promise between them; but William had a mother and little sisters to support as well as Lucy, and marriage could not be thought of till better days.

Lucy paused, and put up her crown, for she had now reached the narrow, close, and steep staircase which led to their single room. She knew her mother would be waiting for her, and hastily mounted the steps, but started as the light of an opposite street lamp, which shone into the narrow entrance, fell full on the face and figure of a woman, who rose at the moment from her very feet. She was young as Lucy herself, but much taller, and strikingly handsome, though her face was ghastly pale; and there was in the large dark eyes an expression of great inward suffering; but it seemed past. Lucy was much struck with her appearance, and her wretched clothing for such a night. It consisted of nothing but a soiled muslin cap, an old worn-out calico gown, and shoes for which the lowest pawnbroker would not give a penny.

'Why do you stand looking at me, girl?' demanded the stranger in a low and husky voice, but with a manner commanding and stern. 'Have you never seen a woman in poverty before? But perhaps,' she added in a milder tone, 'you also wish for a seat on the steps?'

'Oh no,' said Lucy; 'I am going home.'

'You have a home, then,' rejoined the woman quickly; 'and so had I once, but never will again.'

'Yes,' said Lucy, alarmed at what she considered symptoms of insanity. 'We live here, and I am a dressmaker's girl.'

'I was a merchant's daughter,' said the woman. 'I had a father and mother, ay, and sisters too.'

'And why are you so poor and lonely now?' said Lucy, who, in spite of her weariness, felt interested in the desolate condition and singular conversation of the stranger.

'I have fallen from my first estate, girl. It is a common story. I loved and trusted, and was betrayed, and now all is past. I have lost one place in life, and have sought for another in vain. But two choices still remain to me, and I am sitting here to deliberate which I shall take.'

'And what are they?' earnestly inquired Lucy.

'The Thames or the streets, girl,' said the woman sullenly, as she once more took her seat on the cold and frosty stones.

Lucy's heart grew sick within her. 'Oh, don't think of the like,' she said. 'Remember the precepts you must have been taught in better days. Would you destroy yourself both in this world and the next?'

'There is no other choice, girl. I'm starving. For the last week I have sought employment in vain. I have pledged every article on which I could raise anything; and my long black hair, that was braided for many a ball, I have cut it off and sold it for bread. Oh, well may the miser value money,' continued the stranger with energy; 'for half the price of one of the handkerchiefs I used to have would now save me from destruction.'

Lucy stood still, for she could not go. She feared what her mother would say if she ventured to ask the stranger in under such circumstances; but she could not leave the desolate woman there.

'Girl,' said the stranger, after a minute's pause, 'you are the first that has cast a friendly look on me; and will you now, for the sake of charity, if you have it, lend me a few shillings, or one, even one—for one would save me?'

Lucy hesitated. She knew that the dressmaker owed her one-and-sixpence, which she could not get that night, because her mistress had no change. She

felt her aunt's New-Year's gift in her pocket; but how could she part with it? Oh, if it were morning, for it would be impossible to get change at that hour; but where would the woman be in the morning?

'Lend it to me if you can,' continued the stranger; for Lucy's hand was already in her pocket. 'I will pay you, if ever it is in my power, a thousandfold.'

Lucy thought of her mother and her little sisters, and then of her aunt, and what she might say; but the woman's dark imploring eye was upon her, and, without another word, she took out the treasured coin, dropped it into her lap, and darted up the steps like one pursued by an enemy. Reader, in the days of the old world's faith, when charity was said to be the key of heaven, that single act might have purchased a passport through many sins, and secured the right of entrance for ever. But Lucy had no such thoughts. When she cast her bread upon those troubled waters, it was with no expectation of finding it again, either in time or eternity. She gave freely from her own heart's impulse, and fled for fear of thanks. When Lucy reached her mother's door she found it closed, but not fastened, and entered without noise. Her two little sisters slept on their low bed in the corner; but they moaned and trembled at times through their sleep, for the cold was too great for their scanty covering. The mother sat still by the hearth, where now only a few embers were flickering. Before her was a table, with a turned-down candle, and some humble preparation for Lucy's supper; but, worn out with watching, the poor woman had dropped the little frock she had been mending, leant her head upon the table, and had fallen fast asleep.

'Oh, mother dear, it's late,' said Lucy, gently waking her.

'It is, child; but why did you stay so long? I thought you would never come. But there's some coal here still, and I'll get something warm for you in a minute.'

'Oh, never mind, mother. I'm very sleepy, and will go to bed. But you know,' continued Lucy, 'Lady Fitzalbert wanted her mourning to appear in to-morrow; and as she didn't know which of the dresses she should choose to wear, we had to finish them all.'

'Then, if I were a great lady, I would pay poor girls something over for a hurry.'

'Ay, mother, but there's many a thing great ladies ought to do that they won't,' said Lucy, as she laid aside the last of her garments; and in a few minutes more the over-wrought girl and her mother were both fast asleep.

'It is well you have not to go early to work to-day, Lucy,' said her mother, as the family assembled round their humble breakfast-table at a rather advanced hour in the morning. 'But we have very little bread,' continued she. 'Did you get the one-and-sixpence, dear, you were speaking of?'

'No, mother,' said Lucy; 'Mrs Simson had no change last night.'

'If you would change that crown your aunt gave you, we might take the price of a loaf out of it and make it up again,' said her mother.

'Oh yes, Lucy,' cried the two little girls, speaking together, 'and tell us what you will buy with it, for to-morrow's the day, you know.'

This was a great trial to Lucy. She knew not what to say; for her mother was looking to her for the price of a loaf, and she feared to tell her what had been done with the crown. 'I'll go myself, mother,' said she, taking down her well-worn cloak and bonnet. 'Eat you and the children what is in the house till I come back; it won't be long; and be sure I'll not come without a loaf.'

Lucy was down the stairs before her mother could reply, and lost no time in hastening to the dressmaker's, from whom she hoped to obtain at least as much as would supply the present necessity.

'You're just come in time,' said Miss Lucy the forewoman, in answer to Lucy's good morning; 'for we

have got a very large order, and I was about to send for you.'

'Thank you, ma'am,' said Lucy (who, as may have been observed, was one of the living-out girls, as those are called who take their meals at home); thank you, ma'am; but I have not got any breakfast yet.'

'No breakfast yet,' said Miss Lucy, who thought herself privileged to make what remarks she pleased on inferiors. 'Bless me, what an idle set you must have at home.'

'My mother's neither idle nor lazy,' said Lucy, while her cheek crimsoned. The last word, inadvertently used by her, was particularly obnoxious to the forewoman, because a thoughtless young lady, whose dress was not finished in time, once, in the hearing of the girls, applied it to her instead of her own name, which in sound it much resembled.

'No lady cares about you or your mother, miss,' said the queen of the workroom, while her eye flashed fire; 'but since you are clever enough to be pert this morning, what is your business here?'

Lucy was young, and though a dressmaker's girl, her spirit was still unbroken; and not knowing how she had offended Miss Lucy, she could not help feeling angry at what she considered unprovoked insolence. She therefore answered rather proudly that she did not come to quarrel with Miss Lucy, but to inquire if it were convenient for Mrs Simson to give her the trifle she had earned, adding that she would not trouble her but to supply the necessities of the family. The latter part of her speech was unheard by any but the girls in the workroom, for Miss Lucy had flounced out in a great passion, but returning in a few minutes, she gave Lucy the money, saying, 'There's all Mrs Simson owes you, and you need not come here again, for she does not like impertinent people.'

Poor Lucy felt that any remonstrance would be in vain. Though insulted, and probably misrepresented to her employer, she had no redress, and therefore taking the paltry recompense of many a weary hour, which was now the only dependence of the family, she went forth to traverse the crowded streets of London in search of employment. Her heart would indeed have found relief in pouring out its painful feelings to her mother; but fearing the old woman's thoughts might again revert to the crown, she determined, if possible, not to go home without at least the prospect of another situation. The promised loaf, and all that remained of the money, were accordingly sent home by an acquaintance who was going that way, and Lucy requested her to tell her mother she had something to do, and would not get home till the evening.

The winter day wore on; street after street was traversed, milliner after milliner applied to, but all without success. One had as many girls as she could employ, another had all her work done by apprentices, and a third never employed any girl whose character she did not know. Many a question of low curiosity, many an insulting look and censorious remark, were borne by that young searcher 'for leave to toil,' till at length she discovered an establishment where her services were acceptable; but they did only inferior work, and allowed scarcely half the usual remuneration. 'I will come if I can do no better,' said Lucy on hearing the terms.

'Oh do,' answered her proposed mistress, a rather coarse and plain-spoken woman; 'people who can do no better just answer us; and while there are so many depending on the needle, we are always sure to have plenty of them; but remember you must come to-morrow.'

Lucy promised she would; and, through the fast closing night, and a heavy shower of snow, worn out and dispirited she returned home.

'Oh Lucy, child, you are frozen,' cried her mother; 'but did you hear the news?'

'No, mother; what is it?'

'Why, about the Seymours. William was here to-day himself, and told us all. Their rich old aunt in Plymouth is dead, and has left them her fine shop and

furnished house, and I can't tell you how much money in the bank; besides, they have got ten pounds—whole ten pounds, Lucy, to pay their expenses, and take them down decently.'

'It's a great deal of money,' said Lucy; 'but is it long since William was here?'

'Oh no, just an hour ago; and he inquired for you, and said he would call again to-morrow, and bring you a New-Year's gift,' said Sarah, the eldest of the children. 'But have you laid out the crown yet? Ah, Lucy, tell us what did you buy?' Lucy was spared the trouble of answering by her mother's inquiring—'Where have you been, child, all day; for Mary Jenking told me that she heard you dismissed from Mrs Simson's.' Bad news travels fast, and Lucy was now obliged to explain to her mother the transactions of the day, and also the situation she had at last obtained. The mother listened with that silent patience which many trials had taught her; but when Lucy mentioned the miserable payment, the natural pride of the old woman rose. 'You won't work for that, Lucy,' cried she; 'indeed you won't, and you such a capital needlewoman: they ought to give you something more than a common girl.'

'Mother, they do only common work, and would give no more to any one.'

'We'll wait for a day or two, and look out for a better place. Sure you have your aunt's crown; and if the worst should come, we could live ever so long on that.'

'I lost it, mother; I lost it,' said Lucy; but the words nearly stuck in her throat; yet the old woman caught the sound, and springing from her seat with an agility which only the excitement of the moment could give her, she cried, 'Lost, Lucy; did you say you lost your aunt's crown—the whole crown, Lucy? Where did you lose it? Tell me, tell me fast, and I'll ask everybody; perhaps Thomas the postman might see it, for he finds everything.'

Small things are great to the poor, and Lucy's mother was hurrying to the door to raise a general alarm about the lost crown among her neighbours, who were known to be generally honest and industrious people, when Lucy stopped her. It was the first deceit she had ever practised, and sore were the stings within, between her unwillingness to deceive her mother and her fear to tell her the truth. Yet it was not a storm of angry reproaches which she dreaded; it was the reproving look of that sad patient face—it was the sight of her little sisters pinched and pining from day to day on her now reduced earnings, whilst they knew that she had given away what might have purchased so many comforts for them all. Her aunt, too, kind as she was, was a woman of most violent temper, and should the story come to her ears, it might have had consequences for the family. These terrors prevailed, and grasping the old woman's skirt, she cried, 'Stay, mother, stay; the money is lost, and will never be found; there is no use in making a noise about it.'

'You're not sure of that, child; some of the neighbours might find it. Do let me go and tell them.'

'Oh no, mother; I didn't lose it in the neighbourhood.'

'And where, then, child? Do you know the place?'

'I do not, mother; I do not,' said Lucy, drawing her hand across her brow, which now ached and burned between the fatigues of the day and the suffering of the moment; 'but don't mention it to my aunt, and we will try to live without it.' But the mother and little sisters were not so easily satisfied. Question followed question regarding the time, the place, and the manner of her loss. Many were the schemes suggested for its recovery; many an ill contrived falsehood and clumsy excuse had poor Lucy to make in her endeavours to quiet them, and conceal the real cause of the crown's disappearance. At length the mother agreed that it was best not to mention their loss to her neighbours, lest her sister might hear of it, who, she well knew, could never forgive what she would consider Lucy's carelessness of her present. But the old woman kept it as a subject of secret conversation and wonder for herself and the children;

and many a search they had in the streets and corners, in the vain hope of discovering the lost treasure. Next morning, when ladies were receiving gifts, and gentlemen presenting them, when friends were wishing each other happy New-Years, and people preparing for parties, Lucy was preparing to enter on her new employment with the same worn cloak and broken bonnet.

There was a quick tap at the door, and a tall good-looking young man, dressed in an unmistakably new suit, stepped into the room: it was William Seymour. 'A happy New-Year, Lucy,' said he: 'it is well I came in time.'

'A happier year to you, William, with all your good fortune,' said Lucy, as her pale face brightened up; for Lucy had grown pale and thin of late. 'But sit down, and tell me is it all true?'

'It is indeed, Lucy,' said William; and he repeated what her mother had told her the evening before, adding some hints 'that one could now please one's self, and a man was never settled in life till fairly married. But we must go,' said he, 'by the Plymouth stage, and I only came to bid you farewell. Farewell, darlings; and William, as he kissed the children, put something into the hand of each.'

'A whole sixpence,' cried little Susan, running to her mother.

'And I have got one too,' echoed her sister.

'Oh, William, why do you waste your money with the children?' said Lucy; for the Levers were still a little proud.

But William would not hear that: he shook hands with the mother, hoped her rheumatism would be better when he came back, paused, thrust his hand into his pocket, and seemed as if he would say something more, but got ashamed; and at last asked Lucy if she would see him down stairs. Many a time those same stairs had been their meeting-place. Smile not, reader; for, whether amid mountain heath or city smoke, holy are the spots hallowed by our young affections: the exile revisits them in dreams, the old man's memory wanders back to them through many changes, and, it may be, over many graves.

William and Lucy talked long together, with many a promise of letters, and many a hope for the future. William vowed to come back with the ring as soon as he could get things settled; and then Lucy would never have to work, nor her mother and little sisters want again. 'They'll all live with us, Lucy,' said he: 'But the times are hard now, and perhaps you can't earn much.' The young man drew out some money as he spoke.

'Oh no, William,' said Lucy, whose womanly pride would not allow her to accept any assistance from him; 'we don't want for anything, and I have got a new situation. Besides, you will have need of all you have to go decently to Plymouth, among such great friends as I know you have there.' William felt half-offended; but he reiterated his promise of returning soon, gave Lucy a new handkerchief to wear for his sake, and a seal with 'Forget-me-not' on it, which she promised to use on all her letters. In return, poor Lucy had nothing to present him with but a braid of her own bright hair tied with a morsel of blue ribbon, for constancy, which William promised to keep as long as he lived; and so they parted.

Days passed on, as winter days are wont to pass in London, with frost, and fog, and sleet, and rain, and sometimes snow by way of variety. The festivities of the season went on, the fashions came and went, and Lucy Lever toiled on, day after day, and often night after night, for a pittance which scarcely supplied the little family with the necessaries of life. Often did she deprive herself of bread that they might have enough; often did she practise those stratagems which necessity teaches the poor, to make the shortest means go the longest way: but all her exertions would fail at times; and then, like a dagger to Lucy's heart, came her poor mother's repinings for that lost crown. She did not

speak of it before Lucy, for she knew the subject was painful; but often, when most pressed by want, she would talk in her sleep like one who searched for something she could not find, and exclaim, 'Oh, if I could come upon poor Lucy's crown.' As the season advanced, coal grew dearer, the clothes of the family were wearing out, and there was no fund to replace them. Their aunt could now afford them no assistance, as her husband had discovered some transactions of the kind, and kept a stricter eye upon her than ever.

But amid all these trials, Lucy had still one source of comfort in the letters of William. Pleasant it was to hear the postman's knock when she chanced to be at home, pleasant to hear her mother's announcement, when she returned late from her weary work, 'Lucy, there is a letter for you to-day.' At first these letters came frequently and regularly, full of true love and vows of unchanging constancy; but by degrees they became less frequent, and spoke more of his own wealth and grandeur, and the fine acquaintances he had found in Plymouth.

Alas! the men of the earth are not the men of our early imaginations. But spring came at last, and London sent forth its thousands to meet her by the broad rivers and the beathy hills, and the tokens of her far-off reign came like the breath of a distant blessing to the crowded homes of the city poor. The wants of winter were no longer felt; the children went out to play in the retired streets and lanes, and complained no more of their scanty clothing: Lucy had longer days to work, and the walk to her place of labour was more pleasant, for the cold mornings and stormy nights were gone; but to her sleep there came dreams of the green sunny slope where their old cottage stood, and strange yearnings came over her at times to see once more the violet bed at the foot of the green old mossy tree where she had played in childhood; but it was far away in the country, and Lucy must sew for bread. Summer came with its dewy mornings, its glorious days and long lovely twilights, rich with the breath of roses from greenwood dingle and cottage wall; autumn with its wealth of corn, its gorgeous woods, and the pride of its laden orchards; but the seasons brought no change to Lucy, save that her cheek had grown paler, and her step less light. William's letters had grown fewer and colder too, and at length they ceased altogether. Winter returned, and with it came the news that he had married a rich shopkeeper's daughter with good connexions, red hair, five hundred pounds, and a piano.

Lucy heard it and said nothing; but her acquaintances observed that from that time she grew more silent and thoughtful, and never wore a handsome handkerchief which they had always remarked on her neck before. 'Don't go to work to-day, Lucy,' said her mother on a winter morning whose dim light was scarcely visible through one continuous torrent of sleet and rain. 'Don't go to work to-day; you know we have threepence in the house. Oh, child, you're growing pale and thin, and cough so much at night, it breaks my heart to hear you.'

'It's only a cold, mother, and will soon be over.'

'Ay, Lucy, but you don't laugh and talk as you used to do when things were as bad with us.'

'I'm growing old, mother, and maybe wiser,' said Lucy as she stepped out, for her employer had warned her to come, as there was a great deal of work in haste to be finished; for common people can be in haste as well as ladies.

'Old,' said the mother to herself; 'God help the girl, and she not nineteen yet!'

Oh, it is a weary thing to feel the grayness of life's twilight coming down upon the heart before we have reached its noon; to see the morning of our days pass from us unenjoyed, and know that it can never return. The evening came, but Lucy didn't arrive; the mother sat up, for she could not sleep: but the night wore away; and when the gray light was breaking, her low knock was heard at the door.

'Come to the fire, Lucy, child; you're wet to the skin.'

'Oh no, mother, let me go to bed; I never was so tired; but this will buy something for to-morrow,' said Lucy, as she put a shilling into her mother's hand.

That shilling was the last of this world's coin that Lucy ever earned. All day they kept the house quiet, that she might sleep; and so she did, except when disturbed by a deep hollow cough which came at short intervals. Next morning Lucy talked of going to work, and tried to rise, but could not. Another day passed, another, and another, till a long week rolled away, and still Lucy grew worse. Meantime the funds of the family were completely exhausted, and the few articles left from better days had been sold to raise money sufficient for the rent.

It was another night of December, clear and cold like that on which our story commenced, and almost as far advanced in the season. There was no light in the Levers' room; the fire had died for want of coals; the children had crept together in a corner, for they had no bed now; the mother sat on the floor, with her head leaning on her knees, close by the bed where Lucy lay as usual without complaint or moan. The old woman slept, and talked to herself in her sleep about the lost crown, which still haunted her memory as a golden one might that of a dethroned monarch. 'There it's—there it's,' said she; 'that's poor Lucy's crown; she lost it this time last year.'

'Mother, mother,' said the girl; for she was wide awake, and the cry was loud enough to waken the mother also. 'Mother, dear, I cannot die and deceive you. Forgive me that one falsehood—I did not lose the coin, but gave it to a starving woman I met on the stairs.'

'Oh, the wicked woman, where is she?' cried the mother, starting up in the darkness, as if her vision of regaining the crown had been realised; but at that moment a loud impatient knock came to the door.

'Open the door, mother; that's the knock of the postman.'

The old woman mechanically did so, and the postman indeed presented himself; for Lucy knew his voice as he called loudly, 'Have you no light here? Here is a letter for Miss Lucy Lever, and a shilling on it.'

'A shilling!' said the mother; 'we have no money.'

'Well, there's money enough in it,' said the postman.

'Money!' said the mother. 'Is it God that's sending money to us?'

'What's that, mother,' said Lucy, raising herself by a great effort in her bed.

'It's money!' cried the mother, rushing to her child; 'it's money, and you'll be saved yet!'

'God be praised, mother!' said the girl, falling back, the old woman thought heavily, upon her breast; 'and take it with thankfulness, for it is the payment of my lost New-Year's gift.'

The postman, who was in some degree acquainted with the family, had by this time procured a light, which he gave with the letter to one of the astonished children, saying he would call for the postage some other time. But some minutes after a wild piercing cry startled the neighbourhood. It came from the Levers' room—and those who rushed in to see what was the matter, found the mother still holding Lucy in her arms; but the girl was dead, and an open letter containing a bank bill for ten pounds lying before her on the floor—the relief had come too late.

By whom it was sent was never known, for the letter merely stated that the money came from one who owed it to Lucy. The mother survived her loss as she had done so many trials; but the hand of poverty never again pressed on her or hers. Further supplies were sent from time to time; and in the following season, the passage of the family to America was paid by the same unknown hand. There, it is said, the mother has at last found a grave, and Sarah and Susan have grown

up almost as handsome as their lost sister, and expect to be provided for by the lady who has brought them up, a respectable milliner of New York, who is said to have been the daughter of a London merchant, and the same who received Lucy's Lost New-Year's gift.

SCRAWLERS.

THERE is a class of persons, who, owing to some deficiency in their early education, or an absorbing attention to other pursuits, have unfortunately so far neglected the valuable attainment of a plain and unmistakeable handwriting, as, however great their talents or genius, to deserve the appellation of scrawlers. The mysterious hieroglyphics which they use in expressing their thoughts are a constant source of puzzling vexation: an uncertainty rests upon the minds of the most experienced decipherers of their enigmatical characters, and a probable guess is all that the uninitiated can attain to.

Various and amusing are the peculiarities of handwriting in these people. Some join one word with another along the whole breadth of the paper, so as to resemble a very uneven line. Others ingeniously, with a tortuous pen, make those parts of their letters thin which should be thick, and *vice versa*. Some, of still more original genius, form their letters perpendicularly, or the reverse of the usual angle, their characters resembling music rather than writing. Others are so impatient, that they cannot afford time to finish their words, and this adds very amusingly to the perplexity of the reader, rendering it almost necessary that the writer should append a key to his system of shorthand. Some, as if still more to mystify their epistles, use neither points nor attempt to form sentences, so that the ambiguities afford a pleasing exercise for the reader's patience and ingenuity. Such is a glimpse at the vagaries of this vexatious class of persons.

Great is the trouble and annoyance, and many are the mistakes, which such people cause in social and commercial life. Many a letter is handed about at the post-office, from one clerk to another, in the vain hope of puzzling out the direction, and, after the most sagacious have shrugged up their shoulders in despair, has been consigned to the mouldy repositories of the 'dead-letter office.' Many a postman travels needless miles, worries the inmates of unknowing houses, and brings the servant maids down from their 'two pair,' all in vain, because the direction on his letter is written in such vague characters. Many a friendly epistle is turned over from one member of a family to another, and despairingly dismissed with a 'Well, we can guess what he means;' and the pleasure of receiving a letter from such a correspondent is thus sadly lessened by the difficulty of deciphering it. The meaning of many a business letter is provokingly mistaken, confusion created, and loss sustained, because the order or the directions for executing it were so obscurely written; and many a pleasant appointment irrevocably lost. Nay, so foolishly affected are many people in the style of their own signatures, that these are utterly illegible save by those to whom habit has rendered them familiar. We have known instances where the personal property of travellers was lost simply because no one could be found to decipher the autograph of the owner; and we venture to assert, that for two ordinary individuals who can make out the names of the cashiers and secretaries on our Scottish bank-notes, there will be found twenty to whom the curves and blotches of ink called characters will remain an inextricable mystery.

Of all scrawlers, those are the most annoying who affect bad writing as fashionable, and deem a scrawl one of the indications of a gentleman. Of all silly distinctions, none can be more childish than this, or argue less for the sense of those who affect it. To wear one's coat inside out would be a distinction certainly, but such a distinc-

tion as any one of the least sense or sanity would avoid. Whatever is worth doing at all is worth doing well; and to write badly and illegibly, is surely indicative of pitiable incompetence, or blameable carelessness, or, worse than either, a despicable affectation. A laboured school-boy's squareness of every letter is certainly not desirable; but writing may surely be legible without being puerile, and easy and business-like without appearing as if scrawled with a skewer.

To those who are accustomed to write for the press, a plain handwriting is of great importance, though literary men are often sadly deficient in this respect. We have known instances, indeed, of authors being utterly unable to read parts of their own manuscript, and who have been compelled to erase whole sentences, and substitute something else. Authors whose manuscript is very bad have to pay an additional charge for the extra trouble they give to the printer, besides what they have unavoidably to pay for the many corrections which works printed from such writings almost invariably require. The process of printing, necessarily slow, and always liable to error, is still more retarded, and the chances of error fearfully increased by an author's obscure manuscript. The compositor—the person who arranges the type—is generally too intent upon the mechanical process of picking up the letters, to bestow much pains in deciphering his vexatious 'copy,' and even the sleepless vigilance of the corrector of the press, or 'reader,' as he is termed, may sometimes inadvertently pass over an error where there is so much to puzzle and perplex. When it is remembered how many millions of letters are used in the pages of a very thin book, it is wonderful that even ordinary correctness is attained. When it is considered, also, how important is the transposition of even a single letter, several hundreds of which are used in every page, the difficulty of final correctness, even under the most favourable circumstances, must be apparent, and certainly need not be increased. A most important and ludicrous mistake may be occasioned by the transposition or omission of a single letter. The word 'hops' for 'hopes,' 'tailors' for 'sailors,' 'voracity' for 'veracity,' 'cows' for 'vows,' 'cats' for 'oats,' 'tongs' for 'songs,' 'poets' for 'poets,' 'dairies' for 'diaries,' and a thousand others, though they might seem to an ordinary reader sufficiently stupid mistakes, yet might all be produced by the error—omission or transposition of one letter. Surely, where correctness is so desirable, and error so easy, an author cannot well be too careful in preparing his manuscript for the press.

If authors who write illegibly could see their works in an incipient state as they leave the hands of the compositor, they would tremble, and not without reason, for the final correctness of their tropes and metaphors, as they beheld their pathos whimsically transformed into bathos, and their sublimest figures into figures of fun. When such ludicrous errors (to mention only two out of a host we could adduce as having actually happened within our own knowledge) as 'gaiters and garters' for 'gaieties and gravities,' and 'primroses and pears' for '*primores et pares*,' are made, well may the author tremble for the inaccuracy of a work the manuscript of which is obscure. Fewer would be the 'errors of the press' if the manuscript of the author were as unmistakeably plain as manuscript written to be printed ought to be.

But the schoolmaster is abroad, education is being settled upon a more intelligent basis, and the time, we may hope, is fast approaching when the tribe of scrawlers will be extinct, and when no one will be allowed to arrive at maturity without being taught the valuable art of making known his thoughts in characters not only to be understood, but not to be misunderstood. Men will see the absurdity of wholly devoting their time to the attainment of Greek and Latin, while incapable of writing their own language in an understandable manner. In proportion, also, as a healthy common sense prevails, the fashionable affectation of

scrawling will pass away, and will no more be esteemed a desirable distinction than an impediment in the speech which should prevent the speaker from being understood.

THE ROMANS IN NORTH BRITAIN.

AN able and highly readable volume has just appeared on the transactions of the Romans in Scotland, and the remains they have left behind them in that part of the island.* It has been remarked that the Roman occupation of Britain was of far more consequence than is generally supposed, extending as it did over a tract of time as great as from the reign of Henry V. to the present day. It forms also a peculiarly interesting portion of our history, as it presents an example of a rude nation brought under the influences of civilisation through the efficacy of human passions. The occupation of lowland Scotland by the Romans commenced in the year 80, under Agricola. That energetic people formed roads, camps, and even towns. Few who now live in Mid-Lothian bethink them that Roman citizenship and luxuries once flourished on the hill of Inveresk, or that 'Jove the most excellent and the greatest' had an altar smoking to him at Cramond. Yet the baths and wine-cellars of the former place were found only about sixty years ago, and Jove's Cramond altar now stands in the Advocates' Library. In the year 140, while Antoninus Pius was emperor, the army formed that singular monument of their country's grandeur—a fortified wall across the island, the object of which was to shut out the annoying tribes who dwelt in the Highlands. From this they were, seventy years afterwards, obliged to recede to the Tyne, where a second and similar bulwark was formed; but at a still later period (A.D. 367) the northern wall was re-established by the general Theodosius, and such continued to be the limit of the empire as long as the Romans remained in Britain, which was till about the year 422. In the latter part of the Roman sway, the south of Scotland formed a regular province of the empire, under the name of Valentia.

The little that is known of the acts of the Romans in Scotland, and of the state of the people in that age, is stated by Mr Stuart in a graceful and flowing narrative, in which (upon the supposition that he is a young man) we are inclined to trace the augury of future distinction in literature. The view which he gives of the country, at the time when it was yet a sylvan wilderness, occupied by tribes not much different from those of Missouri and Araucania, is like a chapter in some beautiful romance. The roads and camps are all traced carefully, even unto Ptoroton and Bona (Burgh-head and Loch Ness), and an ample chapter at the end is devoted to the wall of Antoninus. The author modestly acknowledges that his first design was to give only what has been discovered or learned respecting these antiquities since the publication of the works of Horsley, Gordon, and Roy in the last century; but he was ultimately induced to present a view of the whole subject, from a consideration that those works had long been extremely scarce. His volume is thus to be regarded as partly a compilation, and partly a work of original observation: in both characters we esteem it as far above respectability. The scholar has here a satisfactory account of the Roman antiquities of Scotland, illustrated by numerous draughts (in lithography); while the general reader is presented with a work which he may peruse for the sake of its information, without ever feeling it in the least dull.

Taking up the latter part of the work first—the great wall of Antoninus, extending (as our present author thinks) from Carriden near Borrowstowness on the Forth, to West Kilpatrick on the Clyde, and thus mea-

suring about twenty-seven miles, was formed upon the basis of a line of prætorium, or military stations, previously erected by Agricola, but subsequently reconstructed by Antonine's general, Lollius Urbicus. Not only is the island here narrowest, but there is a sort of valley stretching across nearly the whole way, the south side of which presented some natural advantages in point of fortification. The work was performed by the soldiers of two legions, the sixth and the twentieth, and is believed to have been executed in a much shorter space of time than might be supposed; probably not more than a year. It consisted, in the first place, of an immense fosse or ditch—averaging about forty feet in width by some twenty in depth—which extended over hill and plain, in one unbroken line, from sea to sea. Behind this ditch, on its southern side, and within a few feet of its edge, was raised a rampart of intermingled stone and earth, strengthened by sods of turf; which measured, it is supposed, about twenty feet in height, and twenty-four in thickness at the base. This rampart or *agger* was surmounted by a parapet, behind which ran a level platform, for the accommodation of its defenders. To the southward of the whole was situated the Military Way—a regular causewayed road, about twenty feet wide—which kept by the course of the wall at irregular distances, approaching in some places to within a few yards, and in others receding to a considerable extent. Along the entire line, from West Kilpatrick to Carriden, there were established, it is believed, nineteen principal stations or forts; we cannot be quite certain of the number, because, towards the east end of the wall, the traces of their existence have, for two centuries at least, been either very indistinct or entirely obliterated. Calculating by those whose remains have been plainly perceptible, the mean distance between each may be stated at rather more than two English miles. Along these intervals were placed many smaller *castella*, or watch-towers, of which only some two or three could be observed in the year 1755. While the continuous rampart seems to have been little more than a well-formed earthen mound, it is probable that many, if not all of the stations, were either rivetted with stone, or entirely built of that material. In some places it would even appear that the *valhum* itself had been raised upon a stone foundation—probably in situations where the ground was low and marshy, and where it was necessary to form drains beneath the works, to prevent the accumulation of water on their interior side.

The stations along the line were of various size and appearance, some being small and slightly fortified, while others were defended by a succession of ramparts and ditches, and seem to have had towns connected with them. These stations, in all instances but one, were within or to the south of the wall, thus having the benefit of its protection. In most places the vestiges of the whole work have been obliterated by modern cultivation; but in a few moorland districts, and in the pleasure-grounds of Callander and Bantaskin, it is still possible to trace the ditch, accompanied by a slight mound; of the stations, Kirkintilloch alone has left any remains. In the course, however, of the last century and a half, a great number of stones containing inscriptions and devices, as also stone altars bearing the names of deities and their votaries, have been dug up at various stations: there have also been found remains of tombs, of baths, of granaries, and other buildings, the whole of which, being faithfully delineated and described in this book, bring forcibly before us the reality of Roman cohorts posted in Stirling and Dumbartonshires, with all their various ideas in religion and polity so different from our own. Here we see bodies of these soldiers erecting tablets in honour of their purpled Cæsar amidst the wilds of Dumtocher and Kilsyth; modestly adding that they had accomplished the construction of so much of the wall. There we find Quintus Plesintius Justus dedicating a similar stone to the Eternal Field Deities, 'his vow being most willingly performed.' At

* *Caledonia Romana; a Descriptive Account of the Roman Antiquities of Scotland*, &c. Edinburgh: Bell and Bradburne, London: Pickering. 1845. 4to, pp. 304. [The dedication is signed by Robert Stuart.]

a place called Auchindavy, Marcus Cocceius Firmus leaves, huddled into a hole under-ground, four altars which he had himself dedicated—one to Jove, a second to Mars, Minerva, and the Field Deities, another to Diana and Apollo, and the last (*Genio Terra Britannice*) to the genius of the British soil. Shirva, near the same place, exhumes for us the monument which Salmaanes raised 'to the shade [*dis manibus*] of Salmaanes, who died at the age of fifteen'; a father's tribute, doubtless, to a lost son. Castlecary, in like manner, presents an altar inscribed—'To the God Mercury, the soldiers of the Sixth Legion, the Victorious, the Pious, the Faithful—Natives of Sicily, Italy, and Noricum: their vow being most willingly fulfilled.' Men from the Upper Danube, from the plains of Megara and Agrigentum, as well as from Italy, had come to spend their lives as stipendiaries of Rome amidst these Caledonian deserts; where now, such is the change which fifteen centuries will bring, we see the bustle of a 'station' of the Edinburgh and Glasgow Railway! A votive altar found at Nether Croy is inscribed by the vexillation (or soldiers of the standard) of the sixth legion to the Nymphs or Genii of the woods and streams, the deities most apt to occur to their minds in such a situation. 'The inscription,' says Mr Stuart, 'is well executed, and seems to belong to the second century. The fairy spirits to whom it was dedicated were no doubt supposed to trip, with invisible steps, the thickets around—pleased with the votive offerings of military devotion, and not unmindful of their worshippers amid the dangers of the service. It mattered not where the ancient Roman might be placed, as the thousand guardian deities of his prolific religious system were ever around him. Among the forests of Britain, as in the desert plains of Africa, he addressed himself to the *genii locorum* in perfect confidence of spirit, satisfied that the Immortals were of no particular clime, but alike open to his aspirations in every quarter of the world.' A more curious discovery than any of these took place at Castlecary in 1771; namely, a large hollow in a rock, containing nearly a hundred quarters of wheat, 'quite hard and black, and mixed with numerous pieces of charred wood, as if the whole had been exposed to the action of fire. It was scattered about the ground, and some of it lay exposed for many years: a few particles, indeed, may still be seen about the spot, by turning aside the tufts of grass under which they are concealed. So large a quantity of grain would never have been thus abandoned, unless by the hasty and final departure of those who were alone acquainted with the secret of its existence; hence the common opinion which supposes it to have formed part of the stores of the Roman garrison.'

It is surely matter of more than antiquarian interest—matter that touches some of the deepest springs of our moral nature—thus to find such clear-speaking memorials of a people who passed off the field of existence so many ages ago—voices, as it were, left by the long dead to tell us that they once had living feelings and thoughts like ourselves. And these people, too, the countrymen of Tacitus and of Seneca, dwelt for ages upon the very grounds now daily ploughed by our simple Scottish swains, the whole system to which they belonged having vanished into the sepulchres of history for above a thousand years.

It would ill suit, we fear, with our light pages, to go more minutely into Mr Stuart's account of the Roman antiquities; but a short extract from his supposed journey of a stranger into Scotland before the days of the Roman invasion, may not be reckoned superfluous. Trusting to the unpurchased faith of a simple people, the visitor might have leisure, he presumes, to observe the natural productions of the country. 'The oak, the fir, and the graceful birch, would rise by his side, or hang above him from the rocky cliffs; the hazel and matted bramble would obstruct his way as he laboured through the thickets; and, when resting by some sheltered stream, he might, if so disposed, have gathered a variety of the same wild fruits as may yet be found in au-

turn within the silent coppices of our Highland glens. Wherever, in an open district, any considerable grove appeared, there in all likelihood would he find the rude tent-like habitations of the people, clustered for shelter and safety within the margin of the wood. Around these villages browsed their tame cattle, protected by the vicinity of the owners, whose places of abode were in general strongly fortified; while far away, in the deepest glades of the forest, reposed the wild herds of the island—quick of ear to catch the most distant sound, and to start in flight while the tread of the hunter was yet far off. One prominent feature of the scenery, peculiarly calculated to strike his attention, would be the symmetrical clusters of oak which were held sacred to the rites of religion. These were numerous throughout the country, and wherever found, must have proved objects of much curiosity to the stranger. The profound mystery which ever hung over them, the jealous care which guarded their precincts from his approach, the reverential awe with which the Briton regarded it, as he pointed to the spot where stood the monuments of his faith, all would conspire to throw over the Druid's secluded temple an interest greater perhaps than ever extended to the marble fane of Rome's time-honoured gods, the "blue-eyed Pallas and the Olympian Jove." Within these groves may also have been situated the houses of the priests—probably the only ones in the land arranged with any pretensions to comfort, in our idea of the term; but, as their owners courted mystery and seclusion, the passing wayfarer could have no opportunity, we may suppose, of becoming either a guest of the priesthood, or at all acquainted with the arcana of their domestic arrangements. Beyond the isthmus of the Forth and Clyde lay the great forest of *Celyddon*, which gave, in the Celtic dialect, its name to the Western Highlands, and which, when altered by the Romans to "Caledonia," became the designation of the whole country situated to the north of the wall of Antoninus. From the district of Athol, in Perthshire, it spread over the mountainous interior as far as the county of Sutherland, descending on the west coast to the peninsula of Cantire, and thence stretching eastward to the banks of Loch Lomond. If the country through which he had already passed had been too bountifully supplied with its "leafy mantle-green," and somewhat difficult to penetrate, here the troubles or dangers of the traveller must have been greatly increased. The respected Camden, indeed, on the faith of more ancient authors, endows the Caledonian forest with so many terrors, that we may believe our tourist to have been brought to a stand upon its verge, as even a Roman nerve might have shrunk from the task of entering that gloomy stronghold of the *horribiles ultimosque Britanos*. Impervious from the thick growth of trees and underwood, it was, we are told, infested with wolves, wild bulls, and boars; and, according to some accounts, the grizzly bear had even been known to revel within its dark recesses. Bleak craggy mountains, and dismal swamps of great extent, may have afforded some variety to the landscape, although they added nothing to its attractions. Within those forbidding wilds, however, a considerable population seems to have existed in early times; and, from the many Druidical remains discovered in that part of the country, it appears evident that its inhabitants were not entirely savages, and not quite such unapproachable monsters as the poet Claudian declares them to have been; for it is well known that, wherever the Druids had power, they introduced many customs which tended to humanise and otherwise improve the character of the people; and however selfish may have been the hidden objects of their implied theocracy, their system of religious rule certainly did much to smooth down the salient angles of original barbarism.

In a region, however, such as this, the population was doubtless small when compared with the extent of their gloomy possessions. Unlike the tribes of the Lowlands, the inhabitants of the forest did not probably

apply themselves in any great degree to the rearing of cattle, but subsisted chiefly on the produce of the chase, or on the attractive, if not most creditable amusement, of plundering their wealthier neighbours. Within their own inaccessible bounds roamed the wild white cattle, a race not yet extinct, and of which a considerable number now find shelter in the noble woods at Hamilton Palace. The red deer and boar were also plentiful in this district, with the wolf, the hare, and many smaller animals which nature threw in his way, to supply the Caledonian of old with food and raiment. Brought up from childhood as a hunter, he became, in a high degree, nimble, expert, and daring—in any situation an enemy of no mean repute, but on his native hills, it may be said, invincible; and, such as it was, his native forest—the stronghold of many tribes—required no fabled terrors to render it the best defence possessed by our primitive ancestors against the oft-recurring encroachments of foreign ambition. Within its recesses were foiled the exertions of the best troops the world could then produce. On one occasion only was it traversed by the Roman legions. At their approach, its spreading oaks were levelled, its morasses drained, its mountain torrents made passable, and the heart of the wilderness was gained; but only to be again abandoned with immense loss—the frequent attacks of the natives, and the extreme hardships to which the soldiery were exposed, in struggling through so difficult a country, having annihilated the greatest part of the invading army.

‘Leaving on his left this region—to him another dread retreat of Cimmerian gloom—the lone adventurer, whose course we follow, may be supposed to have proceeded by Strathearn to the Tay, and thence along the eastern sea-coast towards the extremity of the island. Throughout the first part of his progress, the way was probably beset, as usual, with many difficulties; the rich alluvial valley drained by the Earn being then in all likelihood widely covered with woods and thickets: but whenever he approached the sea, beyond what are now the boundaries of Perthshire, the scene would materially change, and the hitherto abundant vegetation give place to a long extent of open moorland country; for such appears to have been the general aspect of that part of Scotland, from the mouth of the Tay as far as the Moray Firth—an extensive track, naturally bleak and sterile, from its exposure to the keen blasts which swept the German Ocean. Wandering by those shores where beat the angry waves which, he might imagine, were rolling on to bury themselves amid the sluggish waters of “Thule,” the solitary traveller would at length find himself on the coast of Nairn or Banff, where we shall suppose him to have brought his journeyings to a close. Little more was open to his curiosity in this remote corner of the world. The northern part of the island, Sutherland and Caithness, was, in ancient times, nothing but an immense morass, here and there covered with trees. It was, besides, much infested by wolves; and, take it all in all, it must have been a region of the most forbidden character, from which the wearied stranger might gladly turn away.’

ADVENTURES OF A FOOT-SERGEANT.*

MR T. MORRIS appears to be the son of respectable parents, residing in the very heart of Cockaigne, and near to that redoubtable garrison the Tower of London. He acquired a thirst for military renown at the time of Napoleon's threatened invasion, when the brave shopkeepers of Great Britain flew to arms, and enrolled themselves in various regiments of volunteers in defence of their hearths and liberties. Volunteering, though eminently useful in deterring the enemy,

produced many odd associations and ludicrous incidents. A vast majority of the male population above sixteen in years, and five feet two in height, appeared at least once a-week in regimentals. The current talk in every town was that of the mess and barrack-room. Marching, counter-marching, and every species of manoeuvring and stratagetic, were discussed from the squire's drawing-room to his stable—from the mayor and corporation in the town-hall to the gossips at the tea-table. Ladies had their drapery measured to them by majors on the staff, and gentlemen were frequently indebted to bombardiers of artillery for the fashion and make of their coats.* Nor was all this military ardour a mere empty and vainglorious ebullition of patriotism. Hundreds died in defence of British liberty; not, it is true, by the sword of an enemy, but from severe colds caught during inclement field-days, when military discipline forbade the use of greatcoats, or even of umbrellas. Despite, however, all such dangers, the enthusiasm was intense while it lasted, and amongst others whom it inspired was Mr T. Morris.

At the earliest possible age—sixteen—and in the year 1812, this aspirant became a volunteer; ‘and oh!’ he exclaims, ‘how proud did I feel when, having gone through my course of drill, I was permitted to join the ranks. Even now, I often think of the delightful sensation I experienced on our forming on the regimental parade-ground, and marching from thence to the Tenter-ground, in Goodman's Fields—at that time a most convenient place for the exercise of troops, and where our evolutions and martial exercises excited the admiration and wonder of crowds of nursery-maids and children, who invariably attended on such occasions. Then, how delightful, on our return home, to parade the streets in our splendid uniform, exhibiting ourselves as the brave defenders of our country, should the Corsican attempt to carry into effect his threatened invasion of England.’ But these, after all, were but insipid raptures compared with those experienced in ‘a grand sham fight between us and the Ratcliffe [Highway?] Volunteers! The ground selected for the event was where Fairlop Fair is held [in Epping Forest], and on the day appointed we left town at six A.M., in the midst of the greatest excitement, accompanied by a great number of our friends, as also by sundry wagons for the conveyance of the sick or wounded, together with some covered carts and a brewer's dray, containing abundance of ham, beef, and bread, as well as a plentiful supply of ale and porter; which good things, it was understood, were for distribution among us, if we should perform our duty manfully in the encounter. How exhilarating, on our road to the scene of action, to be saluted by the cheers of the crowd, the waving of handkerchiefs, the shouting of boys, the thrilling tones of the bugle, and the merry fife and drum. On our arrival at the ground, we found our antagonists had already taken up their position. We were allowed some half-hour's breathing-time, during which the band of the Tower Hamlet's Militia—whose services had been specially retained—enlivened us by the performance of some martial airs calculated to inflame our minds with that enthusiasm so necessary to constitute the character of the soldier. At length the time for action arrived. We fell in, and commenced the duties of the day, which consisted in marching and counter-marching, attacking and retreating, forming squares to repulse imaginary attacks of cavalry, and firing some thirty pounds of blank cartridges at each other. At last the moment came which was to close our operations by a grand charge with fixed bayonets. The two regiments faced each other in line, and after each firing a volley, the men being directed to fire low, that their shots might be more effectual, the

* Recollections of Military Service in 1813, 1814, and 1815, through Germany, Holland, and France; including some details of the battles of Quatre Bras and Waterloo. By Thomas Morris, late Sergeant of the 3d Battalion of the 73d Regiment of Foot. London: James Madden and Co. 1845.

* The Royal Artillery Company of London was incorporated by Henry VIII., and has always been considered the most distinguished of militia corps. It is still a highly effective force. Its members are, with very few exceptions, tailors.

lines advanced, the word "Charge!" was given, "Forward, forward!" and on we went with the desperate determination of men resolved to conquer or die. When we had arrived within about twenty paces of each other, our commanding officers, fully satisfied of our coolness and bravery, and unwilling to expose us to unnecessary danger, gave the word "Halt!" and thereby relieved the apprehension of those who thought a collision unavoidable. Having performed our evolution to the satisfaction of our commanding officer, we were permitted to retire beneath the ample foliage of the forest trees, there to enjoy ourselves with the good things provided for us; and there being no restriction in the serving out as to quantity, we were able to invite those of our friends who had accompanied us from town: and after doing ample justice to the stock of provisions, we formed into parties, and indulged in the merry song and dance. When it was thought we had sufficiently enjoyed ourselves, we were ordered to prepare for the march home; but whether it was the effects of the weather, or the potency of the ale or porter, truth compels me to admit that our return was not of the orderly soldier-like description of our journey outwards in the morning; and many of the men were compelled to avail themselves of the conveyance of the wagons. However, we returned in safety, deposited our colours at the major's residence, and retired to our respective homes, much satisfied with our trip.

Whether from an augmented love of glory, communicated by this inspiring sham-fight, or satisfactory reminiscences of the admirable commissariat arrangements of the brewer's dray, Mr Morris, on returning to the purtious of the Tower, determined to *play* at soldiers no longer, but to become a warrior in earnest. With this view he enlisted in his majesty's 73d, a Highland foot regiment. Having been properly drilled at the depot at Colchester, Morris was 'passed' as fit to join the service companies, then about to embark for the Peninsula from Yarmouth. Arrived at Stralsund, the 73d was afterwards ordered to co-operate, under the command of General Gibbs, with a body of German troops led by Count Walmoden. On the plains of Gordo, near Danenberg, Morris had the first opportunity of comparing a real with a sham battle. The gallant 73d met with the French, whom they helped to defeat. After the fight, Morris doubtless sighed for the covered wagons and bottled stout of Epping Forest; for the hungry soldiers had to sleep on the bare ground drenched with rain. As this was his first 'affair,' the worthy sergeant evidently thinks it was of as much importance to the operations of the war as it was to himself; for he complains that historians have been so unkind as not to take the smallest notice of it.

From Germany the 73d passed into Holland, seeing occasionally very severe service. At length (in 1815) the Anglo-Prussian army, commanded by the Duke of Wellington and Blücher, was concentrated in Belgium, and Morris was quartered with his comrades at a sweet village three miles from the town of Soignes. On the 15th of June, some of the officers and men were playing at ball against the gable-end of a house in the village, when an orderly dragoon brought despatches from General Halket, who commanded a brigade, ordering us to fall in immediately, and proceed to the town of Soignes. The men were scattered about, variously engaged; but they soon understood, from the roll of the drums and the tones of the bugles, that their attendance in marching order was immediately necessary. About four o'clock the order came, and by six we had fallen in and were off. On our arrival at Soignes we found the town filling fast with troops. There was evidently something extraordinary in this sudden movement, but no one knew the cause. About nine o'clock that night we had one day's provision served out, and as the meat was raw, we thought it advisable to cook it, not knowing how we might be situated next day. At twelve o'clock at night we fell in, and in another hour had left the town behind us, and soon entered what is very appro-

priately called the "dark wood of Soignes." In fact, they were on their way to commence that series of actions by which the peace of Europe was to be secured. Urged forward with the utmost celerity, they at length reached the scene of strife, at Quatre Bras, and took part in the action, as a portion of Sir Colin Halket's brigade. During the fight, a circumstance occurred which plainly shows that, from the intensity of the excitement, a man may be wounded unconsciously. It affords, moreover, a pretty little episode. 'Ensign Deacon, of our regiment, was on my right, close to me, when we were charging the enemy, and a private on my left being killed by a musket-ball through the temple, the officer said, "Who is that, Morris?" I replied, "Sam Shortly;" and pointing to the officer's arm, where a musket-ball had passed through, taking with it a portion of the shirt sleeve, I said, "You are wounded, sir." "God bless me! so I am," said he, and dropping his sword, made the best of his way to the rear. After getting his wound dressed, he went in search of his wife, whom, with her three children, he had left with the baggage guard. During the whole night he sought her in vain; and the exertion he used was more than he could bear, and he was conveyed by the baggage-train to Brussels. The poor wife, in the meantime, who had heard from some of the men that her husband was wounded, passed the whole night in searching for him among the wounded as they passed. At length she was informed that he had been conveyed to Brussels, and her chief anxiety then was how to get there. Conveyances there were none to be got; but, encouraged by the hope of finding her husband, she made the best of her way on foot, with her children, exposed to the violence of the terrific storm of thunder, lightning, and rain, which continued unabated for about ten hours. Faint, exhausted, and wet to the skin, having no other clothes than a black silk dress and light shawl, yet she happily surmounted all these difficulties, reached Brussels on the morning of the 18th, and found her husband in very comfortable quarters, where she also was accommodated.'

Early on the morning of the 17th, the British army retreated upon Waterloo. 'As soon as the troops reached that part of the Brussels road nearest to the farmhouse of La Haye-Sainte, the different brigades filed off to the right or left, to take up their respective positions; and it was now understood that this was to be our battle-field, if the enemy should think proper to engage us. Our brigade was placed about midway between La Haye-Sainte and Hugamont; the foot-guards were on our right; the whole of the ground was covered with corn, and the soil of so loose a nature, that, owing to the heavy rain which continued to fall, we were literally knee deep in mud. We could perceive the enemy taking up their position opposite to us, at the distance of about a mile and a half. Their artillery began to play on us, and did some, but not much damage. One of their large shot killed two of our light company; it struck one of them on the cheek, and the other was killed with the wind of the passing ball, as effectually as if he had been struck by it. As the storm continued, without any signs of abatement, and the night was setting in, orders were given to pile arms, but no man was on any account to quit his position. Under such circumstances, our prospect of a night's lodging was anything but cheering, the only provision we had being the remnant of the salt meat served out on the 16th. Having disposed of that, we began to consider in what way to pass the night; to lie down was out of the question, and to stand up all night was almost equally so. We endeavoured to light some fires, but the rain soon put them out, and the only plan we could adopt was to gather armfuls of the standing corn, and, rolling it together, make a sort of mat, on which we placed the knapsack; and sitting on that, each man holding his blanket over his head to keep off the rain, which was almost needless, as we were so thoroughly drenched: however, this was the plan gene-

rally adopted and maintained during the night.' Such was the condition in which thousands of candidates for 'glory' passed the eve of the memorable 18th of June 1815. By six o'clock the next morning, however, the storm had cleared away, and under the cheering influence of a powerful sun, the 73d began to clean their muskets for the coming strife. Morris narrates—with a degree of naïveté only to be appreciated when we reflect he was on the eve of a battle which all knew would be a tremendous struggle, and that he was up to his knees in mud—that, having shaved himself and put on a clean shirt, he felt tolerably comfortable.

The 30th and 73d regiments of foot formed together one of those solid squares by which it is well known the battle was won. Three times in the course of the day did Napoleon's terrible cuirassiers charge this indomitable square of human beings without success. At the fourth, says our sergeant, 'they deliberately walked their horses up to the bayonet's point, and one of them, leaning over his horse, made a thrust at me with his sword. I could not avoid it, and involuntarily closed my eyes. When I opened them again, my enemy was lying just in front of me, within reach, in the act of thrusting at me. He had been wounded by one of my rear-rank men; and whether it was the anguish of the wound, or the chagrin of being defeated, I know not, but he endeavoured to terminate his existence with his own sword; but that being too long for his purpose, he took one of our bayonets which was lying on the ground, and raising himself up with one hand, he placed the point of the bayonet under his cuirass, and fell on it.' Presently the French infantry were brought against them, and the two regiments were ordered to retire. While doing so, 'Sergeant Mure of the grenadiers, a very brave and good soldier, in turning round to have a look at the enemy, received a musket-ball in the forehead, and fell on his back a corpse. A cousin of his, named Morrison, on hearing of his death, ran back, in the face of a most destructive fire, to where his cousin lay, kissed his cheek, let fall a tear or two, and then joined us again.'

When the battle was won, the British troops marched towards Paris. During the occupation of that city by the allies, Morris, while quartered in the neighbourhood, was promoted to the rank of sergeant. About the middle of December the 73d received the route for England, and they arrived in the regimental dépôt at Colchester before the end of the year. Some time after, the company to which Sergeant Morris belonged was ordered to Wolverhampton, and the reception they met with in that town shows the enthusiasm felt respecting the recent services of the army. 'The people at Wolverhampton were all excitement when they heard that part of a Waterloo regiment was coming among them; and as soon as I had announced myself to the constable whose duty it was to prepare the billets, he gave me one on the "Eagle and Child," a decent public-house near the old churchyard; and when the news circulated that one of the Waterloo-men was actually there, people flocked in in such numbers, that the house could not accommodate them. Hundreds of them shook hands with me, and if I could have eaten and drank gold, I might have had it. The house was kept open very late that night, and I was obliged to remain, explaining the nature and circumstances of the battle; and was not sorry when the house closed, and I was suffered to go to bed. The next morning the house of the constable was beset by publicans, who, instead of striving, as they do in London, to shift the burden from them, were anxious to have men billeted on them, finding that it would for a time bring "grist to the mill."

In 1819 Sergeant Morris's allotted term of seven years' service having expired, he quitted the army, and soon, unassisted, attained a respectable rank in civil society.' We congratulate him on the change, and offer our best commendations on the successful manner in which he has 'fought his battles o'er again' in the volume which we are now closing.

GOODNESS OF HEART.

There was a great master among the Jews who bade his scholars consider and tell him what was the best way wherein a man should always keep. One came and said that there was nothing better than a good eye, which means in their language a liberal and contented mind; another said a good companion was the best thing in the world; a third said a good neighbour was the best thing he could desire; and a fourth preferred a man that could foresee things to come, that is, a wise person. But at last came in one Eleazer, and he said a good heart was better than them all. True, said the master; thou hast comprehended in two words all that the rest have said; for he that hath a good heart will be both contented, and a good companion, and a good neighbour, and will easily see what is fit to be done by him. Let every man then seriously labour to find in himself a sincerity and uprightness of heart at all times, and that will save him abundance of other labour.—*Bishop Patrick.*

THE ITALIAN BOY—A SONNET.

BY S. W. PARTRIDGE.

CHILD of the South, I love thy smiling face,
Serenely glowing as thy native sky,
Nor sourly would thy tinkling airs decry.
Gentlest and soberest of the nomadic race,
Not uselessly thou saunterest through life's maze,
For, poor dispenser of cheap luxury,
Thy notes still soothe the exhausted Labour's sigh,
And Sorrow's wrinkles for awhile erase.
Amid the scuffle dire for place and gain,
With noiseless steps thou track'st thy placid way;
And, though the child of insult and disdain,
Plo'd'st mirthfully, among the gayest gay.
Here, Luxury, health, with scanty fare behold;
Here, Avarice, here contentment without gold.

ANECDOTE OF THE ANT.

Mr Kirkby, in his *Bridgewater Treatise*, relates, on the authority of Colonel Sykes, the following anecdote of an Indian species of ant, instancing in a wonderful manner their perseverance in attaining a favourite object:—When resident at Poonah, our desert, consisting of fruits, cakes, and various preserves, always remained upon a small side-table in a verandah of the drawing-room. To guard against inroads, the legs of the table were immersed in four basins filled with water: it was removed an inch from the wall, and, to keep off dust through open windows, was covered with a table-cloth. At first the ants did not attempt to cross the water, but as the strait was very narrow—from an inch to an inch and a half—and the sweets very tempting, they appear at length to have braved all risks, to have committed themselves to the deep, to have scrambled across the channels, and to have reached the objects of their desires; for hundreds were found every morning revelling in enjoyment. Daily, vengeance was executed upon them, without lessening their numbers; at last the legs of the table were smeared, just above the water, with a circle of turpentine. This at first seemed to prove an effectual barrier, and for some days the sweets were unmolested, after which they were again attacked by these resolute plunderers. How they got at them seemed totally unaccountable, till Colonel Sykes, who often passed the table, was surprised to see an ant drop from the wall, about a foot from the table, upon the cloth that covered it; another and another succeeded. Thus, though the turpentine and the distance from the wall appeared effectual barriers, still the resources of the animal, when determined to carry its point, were not exhausted, and by ascending the wall to a certain height, with a slight effort against it, in falling, it managed to land upon the table in safety.

NOTE.

We have pleasure in stating, upon the authority of a correspondent, that the poem entitled 'The Wife to her Husband,' lately reprinted in the *Miscellany of Tracts*, and formerly in the *Journal*, is by Mrs Gillies, formerly Mrs Lemar Grimstone, author of *Clock, Character*, and other novels of acknowledged merit.

Printed by William Bradbury, of No. 6, York Place, and Frederick Mullett Evans, of No. 7, Church Lane, both of St. Paul's Churchyard, in the parishes of St. Andrew, St. Dunstons, and St. Martin, in the city of London; and Published (with permission of the Proprietors, W. and E. CHAMBERS,) by WILLIAM HONERVILLE ORR, Publisher, of 2, Abchurch Lane, at No. 2, ABERN CORNER, both in the parishes of Christchurch, and in the city of London.—Saturday, March 6, 1846.

PRICE 1½d.

PRIDE—OFFENSIVE AND DEFENSIVE.

The French have two words to express pride, *La Fierté*, and *L'Orgueil*. A lady being asked to define the difference, replied very promptly and happily that the first was 'defensive,' and the second 'offensive pride.' The distinction is important. Of the first, it is impossible to have too much; of the second, it is equally impossible to have too little. Defensive pride is that proper self-respect which will not allow its possessor to commit an unworthy, a base, or a mean action. It is that which keeps us from making friends and companions of the vicious, the dishonest, and the disreputable. It is that which urges us to distinguish ourselves above the crowd of the idle, the ignorant, the dilatory, and the variable, by our industry, our wisdom, our perseverance, and our constancy; and which prompts us to win the applause of our fellows by our goodness, and consequent greatness. Defensive pride is the shield with which we keep off the assaults of those who, openly or insidiously, would bring us down to a lower moral level than our judgment and our conscience inform us we ought to hold: it is the amulet with which we preserve ourselves from the machinations of evil, and the perfume by aid of which we may walk amid the haunts of vice without contamination. Without a due proportion of pride like this, in some one of its various developments, no man yet has ever arrived at distinction, or left behind him a name which the world holds in honour. It is the nurse of emulation and ambition, and, like the antagonism of which we spoke in a previous article, becomes, when properly or opportunely excited, the spur to urge the timid or the sluggish to do the good which another has left undone; the steel upon some flinty nature, eliciting heat and light which might otherwise have remained latent for ever. Pride of this kind sits as well upon the humblest as upon the loftiest. It is the pride of a man independent of his rank, his wealth, or his station; the pride of the gold, and not of the stamp upon it. Pride of this kind has found its most poetical, and at the same time its best and truest utterance in the song of Robert Burns, 'A man's a man for a' that.' Every one who feels his heart glow at the sentiments expressed in that glorious lyric, feels defensive pride; and if he continues to feel it, and makes it the guide of his life, he becomes—though he toil all day, and far into the night, for hard and scanty bread; though he 'wear a shen gray,' and dwell in a hut scarcely sheltered from the winds and rains of heaven—an ornament to his kind, and a blessing to himself.

Offensive pride, on the other hand, shows the little mind, as defensive pride exhibits the great one. It is the pride of externals, as defensive pride is that of internals; the pride of the adventitious circumstances in which a man is placed, and not of the qualities of the

man himself. Offensive pride assumes various forms, and is in all of them equally a proof of ignorance, presumption, and heartlessness. To the man of sense, it is always ridiculous; and wherever it does not excite the anger, it is sure to excite the contempt of the well-minded. When we see a man proud of his high lineage, and expecting that we shall do homage to him for the virtues of his ancestors, although he have none of his own, we despise him all the more for the highness of his name: his pride and his lordly airs gall us, if we are of stern nature; and provoke us to laughter, if we are of the number of those who can find amusement in the contemplation of human folly. Proud men of this class have been happily compared to turnips and potatoes; all the best part of them is under ground.

Equally, if not more offensive, is the pride of wealth. This pride is the parent of every meanness. We may be quite sure, when we see a man proud of his money, that he has gained it in a dirty manner, and that he makes really, though not perhaps visibly to all men's eyes, a dirty use of it. If he have a large house, it is not for use but for ostentation. If he have fine carriages, valuable horses, and footmen in gay liveries, it is that he may excite more attention from the frivolous and unthinking, than some one else who has hitherto rivalled him. If he give splendid entertainments, it is that he may make the earls or the barons who condescend, or the poor dependents who fawn and cringe, to appear at them, envious of the wealth which their own can never equal. If he give charity, it is that it may be blazoned abroad; for he will refuse five guineas to a deserving object if the donation is to remain secret, when he would give a hundred to a less deserving one if the fact could be trumpeted in the newspapers. Such a man pays for the publication of his charitable deeds; and not only does not hide from his left hand what his right hand does, but fees the common crier of the streets to promulgate it with embellishments. Such a man is not proud of being charitable, but of being thought so—not thankful for wealth, because it enables him to do good, but proud of it, because it gives him the means of attracting more worldly attention than better men, and enables him to ride and drink wine when superior merit walks and can only afford small beer.

There is also a pride of beauty, a pride of strength, a pride of skill, and a pride of talent, which all become offensive if they are loudly expressed, and are unsupported by other qualities which it is the province of a defensive pride to foster in the mind. When a woman is proud of her beauty, and has neither wit, nor sense, nor good nature, nor any charm of mind that will endure when beauty fades, her pride is offensive. When a man is proud of his physical strength, and acts the giant, and has no mental strength, nor thinks it worth

the cultivation, his pride is offensive. When another vaunts his skill in any particular pursuit—a skill which may be undoubted—and thrusts it inopportunistly and pertinaciously forward, his pride is offensive: and when a man who has gained some credit for talent is always fearful that he will lose it, unless he daily and hourly impresses the recollection of it upon those with whom he may be brought in contact, his pride is offensive, and is that of a little talent only, and not of a great one. Combined, on the contrary, with defensive, and not with offensive pride, beauty, strength, skill, and talent become enhanced in our eyes. Beauty then knows and acts upon the knowledge that goodness will lend her additional charms; physical strength learns not to be proud merely of that which it has in common with the brutes, but to be strong in mind; and skill and talent, conscious that self-praise is no recommendation to the world, resolve to win the world's applause by future good deeds, and not by boasting vaingloriously of the deeds that are past.

There is another great difference between defensive and offensive pride; which is, that while the one invariably keeps its thoughts to itself, the other as invariably shouts them into all men's ears. Defensive pride never makes a boast; but offensive pride is never easy but when the boast is on its tongue. The one is silent, the other is loquacious. Defensive pride is retiring; offensive pride is forward; and the one lives upon the rewards of conscience, while the other only exists upon the babble of the crowd.

There are other kinds of pride which are as offensive as those already mentioned. We would cite, especially, 'sensitive pride,' and the 'pride that apes humility.' Sensitive pride is founded not upon a proper self-respect, but upon inordinate vanity, linked with some degree of cowardice. If it has taken root in the breast of a poor man, or one of inferior station in society, it leads him to imagine insults from the rich and the lofty which are not intended, and to suppose that all the world are thinking how they can show him disrespect, when, in fact, the world is not giving itself the slightest concern about him. But this truth never enters into his mind; for if it did, he would be still more miserable. His consolation is, that the world hates him, and tries to trample him down, and he flies to that rather than to the thought, annihilating to his vanity and self-conceit, that the world most likely does not even know of his existence. In a rich or powerful man, this pride generally springs from some defect, physical or moral, but most often from the former, as in the case of Lord Byron and his lameness. Upon this point his pride was ridiculously sensitive and offensive, and laid bare the weaknesses of his mental constitution—a vanity pained to be conscious of a physical deformity, which rendered him less perfect than the most perfect of his fellow-creatures, and a cowardice that prevented him from rising superior to the possible sneers of the thoughtless or unfeeling.

Of the 'pride that apes humility,' it may be truly said that it is, of all kinds of pride, the most offensive. In addition to the bad qualities inherent in a false and unfounded estimate of self, it possesses that of hypocrisy; and no junction can be more odious than that of hypocrisy and pride. Foolish pride may offend, but hypocritical pride offends and disgusts us. The pride of wealth, of rank, of power, of beauty, or of talent, though they may be unjustifiable, at least lean upon something that exists, or is supposed to exist; but the pride that apes humility leans upon a lie, which it knows to be a

lie. It unites the bad qualities of every other kind of pride, and is, in a manner, the concentrated essence of offensiveness.

GARDEN FAVOURITES.

'One does not now hear,' says Bosc, 'of 20,000 francs being given for a tulip; of a florist depriving himself of his food, in order to increase the number and variety of his anemones, or passing entire days in admiring the colours of a ranunculus, the grandeur of a hyacinth, or trembling lest the breath of an over-curious admirer should hurt the bloom of an auricula.' Certainly not; but cool and calculating as we of the nineteenth century are, it may at least be matter of curiosity to glance at the history of some of these favourites, and to learn the extravagant prices which they frequently brought during the period of their ascendancy. And first of the hyacinth, whose fibrous-rooted bulb and delicate blossoms are now adorning the crystal vases of our parlours and drawing-rooms.

The *Hyacinth*, which belongs to the same natural order as the lily and tulip, is a native of the Levant; but has been cultivated in Britain for nearly three hundred years. It is in Holland, however, that the plant is reared in perfection, the florists of that country carrying on a regular trade in the bulb, and using every effort and device to increase the varieties. Mr Knight, who travelled in the bulb district in 1830, saw more than a hundred acres of hyacinths in bloom between Leyden and Haarlem; and some of these bloemestries had been established for upwards of a century. At first, only single hyacinths were cultivated, but about the middle of last century attention was paid to double flowers; and some of the earliest of these varieties brought the high price of 1000 florins, or £100 per bulb. As the art of cultivation improved, so rose the mania to possess rare varieties, and as much as £200 has been known to be given for a single root. The passion for this, as well as for many of our older favourites, has long since declined: other exotic novelties have taken their place; and it is now rarely that we hear of more than £8 or £10 being given for the finest hyacinth. The ordinary price for good bulbs is indeed seldom beyond eight or ten shillings; and what are called common mixtures may be had, as imported, for £2 or £3 per hundred. The criterion of a fine double hyacinth, according to the Botanical Magazine, is as follows:—The stem should be strong, tall, and erect, supporting numerous large bells, each suspended by a short and strong peduncle, or footstalk, in a horizontal position, so that the whole may have a compact pyramidal form, with the crown or uppermost part perfectly erect. The flowers should be large, and perfectly double; that is, well filled with broad bold petals, appearing to the eye rather convex than flat or hollow; they should occupy about one half the stem. The colours should be clear and bright, whether plain red, white, or blue, or variously intermixed and diversified in the eye; the latter, it must be confessed, gives additional lustre and elegance to this beautiful flower. Strong bright colours are in general preferred to such as are pale.

Tulips.—These fine showy plants are considered to be natives of the Levant, and are very common in Syria and Persia, where they are known by the name of *thoulyban*, from which our word is evidently derived. The Persian word also signifies a turban, and was probably applied to the tulip on account of the resemblance between the form of the flower and that article of dress.

It was first brought into Europe in 1554 by Busbequius; and Conrad Gessner describes it as blooming in gardens at Augsburg in 1559. The period of its introduction into England is uncertain; but Gerarde, in his *Herbal*, 1597, speaks of it in the following manner:—'My loving friend, Mr James Garret, a curious searcher of simples, and learned apothecary in London, hath undertaken to find out, if it were possible, the infinite sorts by diligent sowing of their seeds, and by planting those of his own propagation, and by others received from his friends beyond the seas for the space of twenty years, not being yet able to attain to the end of his travail, for that each new year bringeth forth new plants of sundry colours not before seen; all which, to describe particularly, were to roll Sisyphus' stone, or number the sands.' Though the tulip was somewhat earlier cultivated on the continent, it was not till about the middle of the seventeenth century that it reached the meridian of public favour; and then, what had hitherto been an object of legitimate regard among gardeners and amateurs, became in the Netherlands a source of extensive gaming and mad speculation. To such a height did the passion for tulips arrive in 1637, that at a public auction which took place at Alkmaar, one hundred and twenty bulbs were sold for £7875; and one sort alone, the viceroys, was exchanged for articles valued at 2500 florins—£1901. Beckmann, in his 'History of Inventions,' gives an account of this tulipomania, during which tulip bulbs were sold and re-sold after the manner of stocks on the stock exchange of our own country. 'The species *Semper Augustus*,' says he, 'has been often sold for 2000 florins; and it once happened that there were only two roots of it to be had, the one at Amsterdam, the other at Haarlem. For a root of this species one agreed to give 4600 florins, together with a new carriage, two gray horses, and a complete harness. Another agreed to give twelve acres of land for a root. Those who had not ready money, promised their moveable and immoveable goods, house and lands, cattle and clothes. The trade, in which 60,000 florins were sometimes cleared in one month, was followed not only by mercantile people, but also by the first noblemen, citizens of every description, mechanics, seamen, farmers, turf-diggers, chimney-sweepers, footmen, maid-servants, and old clothes women. At first every one won, and no one lost. Some of the poorest people gained in a few months houses, coaches and horses, and figured away like the first characters in the land. In every town some tavern was selected, which served as a 'Change, where high and low traded in flowers, and confirmed their bargains with the most sumptuous entertainments. They formed laws for themselves, and had notaries and clerks.'

The object of these speculations, however, had nothing to do with the desire to possess or cultivate the plant; it was a mere gaming for money, and totally unconnected with the feelings which prompted the first purchasers. It was a theme which drove the grave, the prudent, the ponderous Dutchman as wild as ever did the South-Sea Bubble his more excitable and less calculating brother, John Bull. 'A speculator,' continues our authority, 'often offered and paid large sums for a root which he never received, and never wished to receive. Another sold roots which he never possessed or delivered. Oft did a nobleman purchase of a chimney-sweep tulips to the amount of 2000 florins, and sold them at the same time to a farmer; and neither the nobleman, chimney-sweep, nor farmer, had roots in their possession, or wished to possess them. Before the tulip season was over, more roots were sold and purchased, bespoke and promised to be delivered, than in all probability were to be found in the gardens of Holland; and when *Semper Augustus* was not to be had, which happened twice, no species was oftener purchased and sold. In the space of three years, more than 10,000,000 florins were expended in this trade in only one town in Holland.' The bubble, however, burst at last: the ultimate purchasers failed to meet the demands made upon them, and as many were then ruined as had previously

made fortunes. The Dutch government interfered, and a decree was passed, ordering that every seller should produce and offer his bulbs to the purchaser, and in the event of the latter refusing to receive them, the vender had it in his power to retain his tulips, and sue for damages. This laid the axe to the root of the tulipomania of the Netherlands; but the passion for the flower from which the mania arose still continues to influence the floriculturists of that country, who are, without doubt, the best bulb-growers in the world. The taste for tulips in England appears to have arrived at its climax about the end of the seventeenth and beginning of the eighteenth centuries; and they still remain flowers of considerable value among florists; for, according to Mr Hogg, a moderate collection of choice bulbs cannot now be purchased for a sum much less than £1000, at the usual prices.

In its habit and structure, the tulip is closely allied to the lily, and is therefore ranked under the natural order *Liliaceæ*; by some botanists it is itself regarded as the type of the order, which is then known by the name of *Tulipaceæ*. In cultivation, tulips are classified according to the character of their perianths or floral portions thus:—1. *Byblemens*, such as have a white ground variegated with purple, the edges well feathered, the leaflets of the perianth erect—the whole forming a well-shaped cup; 2. *Bizzæres*, having a yellow ground, variegated with scarlet, purple, rose, or velvet, and well feathered round the edge; 3. *Roses* with white ground, variegated with rose colour, scarlet, or crimson; and, 4. *Sels*, or plain-coloured tulips of a white or yellow ground, without any marks. As it is solely for ornament that the tulip is reared in our gardens, the great object of florists, for nearly three centuries, has been variety, rarity and delicacy of pencilling, and perfection of form. For these ends tulips seem to possess a peculiar adaptation; and thus at the present moment we have, by carefully selecting and crossing, a variety and exuberance of colouring which is almost inconceivable. Nor is it to be presumed that this Protean power in the tulip is exhausted: we know as little of the limits of vegetable adaptation as we know of the cause which determines the form of the leaf or the colour of the blossom.

Dahlias.—'These splendid plants,' says Maund, 'are natives of Spanish America, and though noticed by the Spaniards about the middle of the seventeenth century, did not attract much attention till they had flowered at Madrid in 1790, when Cavanilles described them in the first volume of his *Icones*. In 1802 he sent plants to Paris, where they were successfully cultivated by M. Thouin, who shortly afterwards published coloured figures, and a description of them. The first introduction of the dahlia into England was by the Marchioness of Bute in 1789; but the plants, it may be presumed, were soon lost. In 1802 and 1803 others were sent from Paris, and in 1804 seeds from Madrid; yet for several years they were scarcely heard of amongst us. Their habits being unknown, their increase was slow, whilst on the continent innumerable and splendid varieties were produced; so that, after the peace in 1814, they were poured upon us in all the variety of their present tints; exciting the astonishment of every beholder, and the joy of those who could number such beauties amongst their own collections. Since that time they have been rapidly increased and improved, and England can now boast of varieties as superb as any in the world.' The dahlia takes its name from Andrew Dahl, a Swedish botanist, and ought to be pronounced with the *a* open, as in far, to distinguish it from a very different genus, *dalea*, called after our own countryman, Dale. It belongs to the natural order *Compositæ*, and is now so common, that anything like minute description is unnecessary. 'In form and stature,' says a recent writer, 'it is a Proteus; in tints it is a vegetable prism. Neither are the form nor colours constant in the same individual. The first flowers will be single and of one colour, and the last double and of

another hue; and such is the versatility of the self-colour of a parent, that its seedlings will be edged, or striped, or blotched, and altogether as unlike the mother as change of colour can make them.' We are not aware of a blue variety having been reared; and according to De Candolle, the production of such a hue in the dahlia is impossible.

Ranunculus and *Anemones*, which have long been favourites in our gardens, both belong to the same natural order, *Ranunculaceæ*, of which the common yellow crowfoot of our meadows is the type and representative. The garden ranunculus belongs originally to the milder climates of the Mediterranean, but has been cultivated in England for nearly three centuries. Gerarde reared them in 1594; Parkinson, in 1629, enumerates eight varieties; and Ray, in 1665, increases the list to twenty-five. It was not, however, till between the middle and end of last century that ranunculuses reached their meridian in England, when hosts of new sorts were reared, and florists, as Bosc informs us, became absolute idolaters of the beauty and variety of their colouring. The anemone is a native of the same region as the ranunculus, and was brought into England from Italy about the end of the sixteenth century. Like most other plants, the anemone, in its wild state, has its flowers single; but the corolla can be multiplied almost indefinitely by the conversion of its stamens and pistils into petals, under a judicious system of culture. Both the Dutch and English florists have excelled in this course, the former indeed having sometimes reared varieties with stems half a yard in height, and with blossoms six inches across. The anemone derives its name from a Greek word signifying wind-flower, an appellation actually bestowed upon it by our ancestors, from the circumstance of its naturally growing on open plains or exposed situations, where its feathery grains produce a singular shining appearance when waved by the breeze. The single-leaved varieties are generally known as *poppy anemones*, and the double sorts as the garden, star, or broad-leaved anemones. When first introduced, there were only a few species, but now art has so increased the varieties of this light and graceful favourite, that florists have ceased to distinguish them by individual names. The colours of the ranunculus and anemone are clear, rich, and brilliant, partaking of almost every hue—are either in single uniform tints, or mottled with stripes and patches.

The *Auricula* belongs to the *Primulaceæ* or Primrose tribe, and is found wild on the Swiss and Tyrolean Alps, and on the Caucasian and other mountain ranges of Southern Europe. It was early cultivated in Britain under the name of bears' ears or mountain cowslips; and even in 1768 a gardener near Colchester is said to have reared them in such perfection, that he could boast of not fewer than 133 flowers on a single stem. England, indeed, seems to have carried the palm for the cultivation of auriculas; for about a hundred years ago we used to supply the Dutch florists, though they at an after period re-supplied us with the progeny of our own flowers. The plant is certainly worthy of all the care that has been bestowed upon it; and the more so, that it is as often found gladdening the tiny front-plot or window-sill of the artisan, as the flower garden of the rich and great. The colours of the flower, in its wild state, are yellow, purple, and variegated; but these can be broken by cultivation into a vast variety of hues—yellow, purple, red, scarlet, and bluish coloured, with edgings of gray, green, or white. The delicate velvety texture, which adds so much to the beauty of the auricula, is easily tarnished by wind and rain; hence the great care necessary to protect them from stormy weather, and yet afford them that full exposure to light and sun upon which their perfection so much depends. It may strike the uninitiated as an anomaly, that a native of Alpine regions should require so much care and shelter when brought to the less exposed plains of England. The explanation is thus given by Dr Lindley:—'In Alpine districts, it might be

supposed that it experiences intense cold in winter; but this is probably not the fact; for it is covered early in the winter with a thick coat of snow, under which it lies buried till the return of spring, protected from the severest cold, and screened from the stimulating effect of light. When the snow melts, it begins to feel the excitement of brilliant light, and to unfold beneath a pure and equable atmosphere, perpetually refreshed by the breezes that blow over it, and rooting into rich vegetable mould, which is kept continually damp by the melting snow; but never becomes wet, on account of the steepness of the situations in which the plant delights to dwell. Under the same circumstances they flower and perfect their seeds: the drier weather of summer arriving, they cease to grow with vigour, and in autumn have reached a state of complete torpidity.' To imitate these conditions, the cultivator in the plains must have recourse to artificial means; the snow blanket he provides by a frame of glass and ashes, sheltered by mats; the perpetual moisture he supplies by his watering pan; the moistened soil he imitates by a compound of rich mould laid on broken pottery; the light and sunshine he affords them at the proper season, so often as our unstable climate will permit. Even with all this trouble, the care of the florist is not ended. 'The auricula,' says one of the first cultivators, 'must be bred as high as a race-horse, by a corresponding attention to pedigree; and it is for want of this attention to high breeding that so many persons fail to obtain a single good variety from a thousand seedlings.'

Hollyhocks.—These magnificent plants are natives of most eastern countries, being found in China, India, Africa, and even Siberia. At what period they were introduced into England is unknown. Dr Turner speaks of them as familiar plants in 1564; and Gerarde, in 1597, observes that they were then sown in gardens almost everywhere. There can be no doubt that they were very early cultivated, their majestic height and splendid flowers rendering them special objects of attention. In a wild state, their corollas are generally single, and of a red, white, or yellow colour; but by transference to more fertile soil, and to a favourable situation, their flowers can be doubled to any extent, and, by care on the part of the cultivator, brought into almost every hue. 'We have but few flowers,' says Phillips in his *Flora Historica*, 'that contribute more to the embellishment of large gardens than the hollyhock, although its hardy nature and easy propagation has rendered it so common, that it is much less regarded by the generality of florists than it deserves. It yields to no flower for the grandeur and beauty of its appearance, as well as for the great variety of its colours, which embraces all the shades of the rose, from the palest blush to the deepest carmine; from a pure white the yellows are equally numerous, until they reach to the richest orange, from which the colour is carried on to a dark chestnut. Others are dyed of a pale reddish purple, running up to a black. The noble stalks which these plants send up, like so many floral banners garnished with roses, render the hollyhock particularly desirable for ornamenting the borders of plantations, and for giving gaiety to the shrubbery in the latter season of the year, since it generally continues its succession of flowers until the time of frost.' Botanically, the hollyhock belongs to the order *Columnifera*, and to the genus *Alcea*, which takes its name from the Greek word *alkē*, on account of its supposed medicinal value in dysentery, &c. The English name is derived from the Saxon hollyoak or holihec—a term, the appropriateness of which is not very perceptible. Besides their floral beauty, hollyhocks are of great utility to bees, as they flower at a season when most other blossoms have faded. The fibrous bark of the flower-stalks furnishes no mean substitute for hemp; and a blue dye, little inferior in beauty and permanence to indigo, can be obtained from the whole plant.

Such is the history of some of our commonest garden pets—such the care, and toil, and anxiety which a few comparatively valueless objects of ornament may cost.

when vanity, ambition, or emulation is concerned in their production. The above, however, is a mere glimpse at an almost inexhaustible record, from which we may hereafter glean another chapter.

THE ROMANCE OF AN AUTHORESS'S CHILDHOOD.

I SHALL here relate a simple story, not so much to show the heart of a young child, as those little quaint pictures of life and nature in which a child's heart found faith and strength: to teach anew, in a story divested of all its intermingled pain, that the very strength acquired by us through circumstance, does but increase the debt of usefulness we owe to society; and that our faculties, our opportunities, and our industry, bind us only the more to turn them to account by increasing the happiness of those we may influence.

I was born in the west of England, and am an only daughter. The circumstances of my birth were those of tribulation and sorrow—a time of commercial distress, that pressed heavily upon the middle classes of society; the failure of my father's only brother, a merchant till then of prosperous fortunes, who had held in his hands the savings of my father's more fortunate and early years; and my father's entrance upon a new scene of professional labour, with all its cares and anxieties.

I was sickly from my birth, but I had a tender nurse in my eldest brother. He taught me to walk, to talk; even before I could understand him, he used to place me in a corner and tell me tales. But before this time, we had left the town where I was born, for another in an adjacent county, and, for a season, more prosperous events had come about. I slept in a little closet adjoining my brothers' room, and could hear them beginning to talk at break of day. I knew the eldest was entertaining the others with some long story, and I used to sit down outside their room door and hear what I could. There were two standard tales, the Black Dwarf, and Robinson Crusoe; but the latter was the favourite. When it was put up to vote which tale should be told, it was always 'Robinson Crusoe, and don't forget the footstep in the sand.' Morning after morning this same thing was said; yet when I knew the 'footstep in the sand' was coming, I grew breathless, and would creep nearer and nearer the door. The 'footstep' was an incident that never could grow old. At length I was found one morning. From that time I became one of the licensed auditory.

The country in which we lived is one of pre-eminent beauty of scenery. Its grand features are mountain and woodland. The 'sedgy' Severn flows swiftly through it, skirting the town in which we lived, and flowing onward through vales and pastures as silent and lonely as the untrodden valleys of the far-west. All the hours my brother could spare from school were devoted to angling. He was an indefatigable fly fisher. I was mostly his companion in his long rambles; for he would carry me miles in his arms, with his creel swung across his back. No ford was too deep to wade, no rock amidst the waters too inaccessible, no little island too overshadowed for our retreat. Solitude and silence became accustomed things; for I have sat whole hours watching the fly upon the dancing waters, only pressing my brother's hand, or looking up into his face, when it would sink far down the stream, and drawing the line swiftly from the reel, make me sure that another fish was ready for the basket. The newly-taken fish often made us our dinner, broiled in true fisherman style across a fire made from the dried sticks shaken by the winter's winds from the very tree that then afforded us shade from the summer's sun. A little ale, from such a road-side inn as Nasmyth painted, was our drink, or a cup of milk from some farm upon the uplands. Bright days were these: at the distance of years the heart grows young again, and the spirit gains an accession of elasticity and joyousness, by the mere memory of that green and unforgotten past.

I believe it was upon a little island in the Severn that I first learned to read. My spelling-book was a thumbed copy of Cowley, not trimly decked in morocco, but smelling of the fresh-plucked grass and cozy trout, with here and there, tucked between the leaves, a hackle, or a wing of some bright-coloured bird. Often during the heat of the mid-day sun, whilst my brother prepared his Greek or Latin lesson for the next school-day, I, too, had some task to learn—generally a verse of poetry—till, soothed by the sound of the falling waters, I would nestle to his side, and sink into the sleep of childhood. One of these noonday lessons was, I well remember, a little hymn by Kirke White, beginning, 'When marshalled on the nightly plains;' another, Wordsworth's 'We are seven.' I was thus, as it were, insensibly taught to read and love poetry together. From such a summer's life by stream, and in the far-off woods, lessons from the great book of nature were learnt and understood. Birds, fishes, flowers, the change of the seasons, the colour of the waters, the tints of the sky, the hue of the woodlands, the clustering fruits of autumn, were so many glorious things, that in their freshness and beauty spoke to the child of the love and divinity of God.

In these rambles we often met with adventure and characters. Sometimes in the braken, where no human foot seemed near, we would find some worthy brother of the angle. There seems a kind of freemasonry among the craft. The little courtesy of a borrowed line or float would often lead to a conversation that might have delighted Cotton or his worthy father Walton. From habit, I was quite expert at judging the difference between a May fly or a June fly, a gnat that suited the shallow ford, or a worm for the deep waters. Many a thank these worthy brothers of the angle would bestow on me; and I still remember that tinted dragon-fly, and that passage of Cowley, which brought me kind words from one illustrious as a philosopher. To the dialogues that often arose from these fishing adventures, I was always a silent listener, till the moon, rising in the heavens, would cast upon the trickling waters its silver light, or the nightingale, raising its clear notes in the upland coppice, would warn us that home was far away. Surely in the glory of such an hour, when peace had fallen upon the earth, and nature herself seemed to worship the great Spirit of the universe, the heart of the young child must have prayed too. The visible presence of thanksgiving in the rippling stream and nightingale's voice, might well make father Walton sing, 'Lord, what music hast thou prepared for thy saints in heaven, when thou affordest men such music upon earth!'

Old water-mills, with dripping slimy wheel, the foaming waters in the mill-dam, the gutted cottage standing half-way in the stream, the coppice lane, the silent wood, the hewn timber, or the loaded wain, were to me so many things of natural delight!

My brother and I several times narrowly escaped with our lives, by fording the river at flood times. Once by being pursued by an infuriated bull. Roaring and pawing the earth, it had pursued us across several fields, from a shallow rivulet by which we had been sitting. My brother flung aside his rod and creel, and seizing me in his arms, fled with naked feet (for he had been wading) for his life. The bull gained upon us field by field, till his very horns were within a foot of us, when my brother, still holding me tightly, plunged at one bound from the steep bank into the deep waters below, and gained in safety the other side of the river.

Amongst the many that my father's profession made him acquainted with, was a family with whom I became a favourite. There were a father and mother, a brother and two sisters. Their happy home, their love and union, their wise and rational piety, are remembered by me to this hour. The son was a large bookseller, the father agent for the publishing house of Childs of Bun-gay. In this happy home of theirs six days of the week were often spent. As soon as I could read, I used to creep into the shop, and carrying with me the old lady's

footstool, find a quiet unseen corner, where, with a lapful of books, the hours passed by unregarded. As every book was found replaced, I was privileged and allowed to pick and choose at will. My little unseen corner became a sacred spot, from which no inducement of pleasure could win me. At night, there was the cheerfullest hearth to sit by I ever knew. The high-piled fire roared merrily up the quaint wide chimney, and twinkling with ruddy glow across the polished floor, took even from the oaken press and ancient chairs their look of dark-brown age. The supper would be spread, the sisters side by side, the mother in her ancient chair, the father gravely meditating over his evening pipe, whilst within the glow of the hearth stood the tankard of winter ale, its creamy top half hidden by the crisp brown toast. Then after supper would come dropping in, perhaps, the minister, or some grave man, who had been out upon the hills with monthly copies of devout books and holy bibles, who, travel-worn, had yet come to give first greeting to the 'master.' The scatterer of holy Bunyans, large-typed Doddridges, or Divine Meditations, never lapsed into a smile, but ever bore about with him the conscious dignity of his calling: wisely, too, and not unworthily. For the dissemination of a truth is next to its creation; and the apostle of knowledge, like the apostle of old, bore not the burden of truth without consciousness of its holiness.

In a distant part of the house was a very large and ancient room, filled all round from the floor to the ceiling with the grave literature I have spoken of. At times I took my little stool there. I know not how it was, but in that room I rather thought than read, going round the walls, counting the many shelves, and wondering how, and when, and why, men had written so much.

I must now speak of my father; for, as I grew up, I became his companion. I scarcely ever went to school, but rather picked up the rudiments of learning from overhearing my brothers at their lessons, and from an unceasing and unchecked love of reading. To modify a natural feebleness of body, I enjoyed much out-door exercise, and became the chosen companion of my father in many rambles about the country during his spare professional hours. Sometimes from home, sometimes from the houses of country friends, we would visit particular spots remarkable for their scenery, or for the historical or antiquarian events associated with them. All our walks had a pursuit annexed to them. Perhaps a book in the vestry of some ancient church among the hills, perhaps some spot alluded to in Tacitus or Cæsar, or some legend in a county manuscript, might be the object of attraction. One summer we visited Offa's Dyke, not on one day, but on many, seeing and tracing it from many points. This dyke was the boundary of the great Mercian kingdom on its western side. It extended from Flintshire into Herefordshire, and was a defence against the incursions of the Welsh into the kingdom of the Saxon heptarchy. The parts which are yet entire consist of a trench and mound, carried over hills and through almost inaccessible morasses.* The ditch is invariably on the Welsh side; and in many places it yet serves as a boundary line. The mound is seen stretching for miles across the border hills. Many an evening on its lofty height I have sat and listened to its history and origin. With the illimitable distance stretched out to view, the river glinting across the plains like silver threads, the woodlands casting broad shadows over the green-clad valleys, whilst far away the sinking sun shed its last glory on the mountain tops, with no sound of human voice, I have sat and listened till my heart has grown courageous, and my hand strong, as if, in truth, I were the daughter of ancient border chieftain.

Another summer, when I had grown older, we made excursions to Wroxeter, now a mean village, but once the site of Uriconium, the celebrated western city of the Romans during their dominion in Britain. This

was once so extensive, that it covered from three to four hundred acres.* No vestige of it is now left, except the ruins of a gigantic wall, some twenty yards in length. But the buried relics of the city were many. Often has the ploughshare thrown out into the darkened furrows coins, bones, fragments of pottery, and pieces of glass, after their burial of sixteen or seventeen hundred years. Over the streets of this once great city, where temples had stood, where human ambition and human care had toiled, rich harvests of wheat now grow, richer and more luxuriant than common harvests,† because fed by the very ashes of the buried city from household hearths, market-places, sepulchres, and altars. From the distant uplands we have in spring-time traced the outlines of the buried city by the darker fallow and the deeper green of the springing wheat or grass.

Old Roman encampments were often found. Passing through the ferny brake, crushing the young primrose or violet, we would toil up the steep ascent, and resting at last in the inner vallum, drop pebbles down the well, that, still entire, with an old mountain-ash now growing from its side, once supplied the Roman camp with water.

Upon recovering from a severe illness when I was about eight years of age, I was sent for change of air to a relation's in a distant part of England. Every comfort that money or the providing hand of love could procure, was heaped upon me; and, under the care of a friend, I left home one fine morning in May. I spent a whole week with this friend in London, at the house of a city merchant in Crutched Friars. I well remember the old, gloomy, oak-panelled rooms, with staircases and galleries wide enough to have held a coach-and-six. The very number of the stairs, the very patterns of the carpets, the dusty mirrors, the figures on the old Dutch clock in the gallery, are as fresh before me as if I had seen them yesterday.

I was received by my relations with an overwhelming show of kindness, which, as a prodigy, lasted for a whole week. At the end of that time things changed; and the Eden that was to be, proved a wilderness of bitterness. I was weak in health and emaciated in body. At the end of the one week I was stripped of what I wore and what I brought, starved, beaten, and driven from the house, from early dawn till night, to some fields in the rear of the house, with nothing but a hollow pit of sand to hide myself in, or the peas or carrots from the field for food. I, too, who had been reared with all a father's love, who had thoughts so far beyond those who oppressed me, that, hiding them in my own heart, secretly and proudly, like precious jewels, I laughed to myself, and said, 'These ye cannot touch, oppress as ye best may.' I sometimes look back upon those eleven dreary months, and wonder how I lived: yet what were they to what the future was to be! It was soon found out that I was clever at the needle. From thenceforth many days, from early dawn till night, were passed at it, executing narrow embroidery; so that when I did get a day in the fields or the barren heath beyond, it was a coveted luxury. When I would creep back at night, I generally found my day's food thrust upon the step of the staircase; for I was forbidden to return to the house within stated hours. With this I would steal to the garret where I slept. It was the topmost room in the house, with a shelving roof, a narrow window, partly without glass, an old oaken bedstead, a wide chest, and one chair. Often, as I lay sleepless, a large bat, which, during the day, had lodged in the worm-eaten curtains of the bed, would crawl forth, and whizzing past to the window, which it knew would never shut, leave me in a state of terror it were impossible to describe. Sometimes, when the moon was bright, and the night fine, I would draw the chair to the window, where, leaning out upon the roof, I could watch the stars, to wonder perhaps why misery or oppression was on earth, when all above in heaven

† Plymley's Report on Agriculture before the House of Commons.

bespoke peace and uniformity. What wonder was it, then, that I thought, and afterwards wrote, what I then conceived to be poetry? It was a secret which, for years after, I guarded as my life. But I must tell upon what I wrote.

Adjoining to the house where I lived were a Catholic chapel and some cottages, where the officiating priests dwelt. An extensive garden, belonging to the priests, ran parallel for a considerable way to the fields I frequented, and was divided only by a ditch and hedge. Everything, to one so solitary, was soon a matter of observance. I found that, at certain hours of the day, an aged priest came to a little green plot that, shaded in by bushy shrubs, lay at the extremity of the garden nearest the heath. This place was a sodded hollow, in which was a sun-dial, and beds of the rarest carnations. To these the old man attended with assiduous care, watering and pruning, propping and pressing up their bursting flowers with round pieces of card and paper. As these flowers died, the card or paper was taken off. That they might not litter this little dainty plot of ground, they were placed in a corner of the rustic seat upon which the priest daily sat to read. When he had tended his flowers, he usually read a book he brought, mostly aloud, and always in the Latin tongue. I have since thought that that old man might have written on his sun-dial what the monk of old did, *Horas non numero nisi serenas*—'We only count the hours that are serene.' One day, after a storm of wind, I found the pile of card and paper scattered and blown by the wind over the thick hawthorn fence. These little papers seemed like a providential gift. I gathered them, and carefully concealed them in my bosom. That night, in the bright moonlight, with the window-ledge for my table, and a burnt skewer for my pen, I first wrote down my thoughts. My nights were no longer unhappy, or the hours long. The moon was to me like the face of a dear friend in the far-heavens. How to hide these papers became a matter of grave thought. If they were found, I should be beaten; if I hid them on the heath or in the fields, the rain might destroy them: my room contained no hiding-place. At length I found the strangest one in the world: no comic romance could have devised a stranger: it was a worm-eaten hollow in the leg of the bedstead. To me it was the rarest cabinet ever devised; for it safely held all my worldly treasures.

The life I led is too terrible to describe. No Oliver Twist in a workhouse had a worse. I was without friends, without sympathy, without books. I knew my heart was breaking. At length, without warning, one bitter day in March I was hurried to the nearest town, and on to a coach. With a begging letter and half-a-crown I commenced my journey of three hundred miles. My half-crown proved to me an inexpressible torment; my whole thoughts were how to divide it. Every time I saw a guard or coachman dismount, I thought of the necessary shilling. To do the best I could, I changed it for five pence: when the coach stopped in the night, the coachman came for his gratuity; I put a sixpence into his hand, and burst into tears. 'I am very poor,' I said; 'tis all I can give.' He pressed back the sixpence, held up a lantern to my face, left me, and returned in five minutes with a steaming glass of weak brandy and water, and a plate of sandwiches. I had had no food since early morning. He made me eat and drink, thrust the remnant of the sandwiches into my lap, bade me a cheerful good night, and shouting out to the guard, 'I say, Joe, be good to this little 'un, as the Lord loves you,' disappeared within the tavern door. About three o'clock in a drizzling March morning the coach reached the metropolis; I alighted, and had to sit upon my box on the pavement in Oxford Street, whilst the merits of the letter I carried were discussed within the coach-office. At last, after a weary time, I was placed in a hackney-coach with an intoxicated man; my terror was indescribable. One of my sixpences was called for to pay a turnpike gate. At length the

western coach was overtaken, and my journey continued. I had for my companion an aged Jew. As dawn broke, he viewed me very attentively, and vowing that I was like his dead daughter Rachel, invited me to partake of his breakfast, consisting of hard eggs and brown bread. This I declined; but I was an attentive listener to his story—as pathetic, if not so poetical, as that of Jephtha's daughter.

The early morning of another day found me in a large town some few miles from my own. One of my memorable shillings had been divided between two obliging coachmen. I sat with the last in my hand upon a settle within the bar of the inn where the coach stopped. The landlord came to ask me if I would not have breakfast? I resolutely said no. I had then a habit, as I have now, of unconsciously talking aloud. I debated the expenditure of the shilling; I was overheard; the fat landlord reappeared; he took me by the hand, led me to his own breakfast-table, watched whilst the landlady sweetened my tea well, told me some long story about his own boyish travels, and considered my outspoken comment upon the shilling as an amazing joke. I reached the end of my journey with that shilling unbroken.

They did not know me when I reached home. My father wept over me like a child—I was so altered—so broken-hearted. I became insensible from excess of joy. If, like the ancient king, I counted up the number of my happy days, that day of return would be one of them.

THE STREETS OF LONDON.

NO. I.—MONMOUTH STREET.

Among the many streets of London that have a peculiar character, and are inhabited by a peculiar people, one of the most remarkable in all respects is Monmouth Street. It is a somewhat broad thoroughfare, taking a semicircular bend from the top of High Street, St Giles's, south-west towards the intricate regions of Seven Dials on the one side, and of Soho on the other. It is the main thoroughfare of that crowded district, and is crowded and wretched enough in itself; but different in the kind of crowd, and the degree and description of wretchedness, from all that surrounds it. The most careless observer cannot enter it without being struck by the singularity of its appearance. It abounds with dealers in second-hand articles, chiefly of apparel, and is the grand entrepôt for old clothes for the west end, just as Petticoat Lane and Rag Fair are for the eastern quarters of the metropolis. The stranger, on passing through it, is struck with the unhealthiness depicted on the pallid faces of the children, with which it absolutely teems; and with the strange disagreeable musty smell that arises from its overcrowded cellars, and pervades the houses to the very chimney-pots. To those who do know it, and who wish to study human life and character, there is no spot in the whole metropolis that offers a more fruitful subject for observation.

It takes its name from the unfortunate son of Charles II., who was executed for rebellion in the year 1685. Soho Square, in the immediate vicinity, which was built about the same time, was originally called Monmouth Square, in honour of the same personage; but after his execution, its name was changed to that which it now bears. The street retains its first appellation. At that period the neighbourhood was fashionable; but fashion gradually travelled to the west and north, to Gerrard Street and Dean Street, and then upwards to Tyburn; and the whole place, south and east of Soho Square, about eighty or ninety years ago, was left to the lowest of the population of London. At what time the Jews first took possession of Monmouth Street is not exactly known. Gay, in his amusing poem of 'Trivia,

or the Art of Walking the Streets of London,' mentions Monmouth Street as famous for 'old suits' in the year 1712; so that generation after generation of the same race of people, and the same peculiar class of traders, have continued, through all the chances and changes of time and fashion, to make it their dwelling-place. It numbers about fifty houses on each side of the way; and on the right-hand side, on entering from High Street, forty-five at least out of the fifty are shops occupied by dealers in old clothes, chiefly Jews; the remainder being chandlers' shops, to supply the hourly wants of the inhabitants. The other side is not quite so full of Jews; but at least one-half of the shops even there are occupied by them, and the other half by dealers in the cast-off apparel of ladies. Their wares are spread out to the best advantage, and cover the windows to such a degree, that very little light can penetrate into the shops. The doors are also half blocked up by strings of garments, which dangle in the impure atmosphere, and shut out by that inlet also the light which might otherwise enter. In fact, the whole stock in trade of one of these shops is sometimes displayed in front of it; for when you enter, little else is to be seen besides a deal counter, and a beggarly account of empty shelves. Jews have for the most part this striking peculiarity—they love not only to do business, but to enjoy pleasure as much as possible out of doors. Enter the street when the tide of business has most strongly set in, and you will be sure to see before some of the shops the process of a bargain and sale enacted in its minutest details. The actors in the scene are usually the shopkeeper as buyer, and one of his peripatetic brethren—of whom so many perambulate the streets with long bags and incessant inquiries after 'Old Clo'—as vender. Observe the 'diamond cut diamond' fashion with which the negotiation is carried on—'When Jew meets Jew, then comes the tug of war.' It is curious to witness the searching scrutiny with which the purchaser examines the garment. It is a coat. First of all, it is held in outstretched arms against the light, that any transparencies in the texture may be detected in the back and skirts. Then the sleeves are turned up, and the elbows carefully examined as to the number of threads which wear has rendered visible, or the quantity of grease they have imbibed—sure indices of the amount of service the garment has seen. Then comes the important question of price, concerning which a warm discussion takes place. Again the coat is examined, the number of 'thin' places and the quantity of grease about the collar and cuffs carefully estimated. Presently the storm subsides; the coat and a half-crown or two change owners, and the parties separate.

In a day or two that same coat makes its appearance amongst the rest of the stock in front of the shop, and none but an experienced hand would know it again. When it was bought, it was rusty, dirty, and threadbare; now it is to be sold, it is glossy, black, and with a very respectable appearance of nap. It has in fact undergone a mysterious process called 'duffing.' By the aid of soap and turpentine the grease has been removed; a wire clothes-brush has scratched up a nap from the bare threads, whilst a sort of pigment, which partakes partly of the nature of dye, partly of that of blacking, has been rubbed into it; 'and,' exclaims the Jew as he hangs it up exultingly for sale, 'who's to tell it from a new one?'

With baits of this kind, the Monmouth Street shopkeepers have no mean power in attracting and fixing the fancies of many persons who have little to spare for the adornment of the outward man. It is a maxim with the fraternity, that whoever appears in the street is a customer; or if not, that he ought to be. Consequently, nothing is wanting on their part to draw him into a 'transaction.' They pace up and down before their shops, and inquire of every passenger 'if he wants anything in their way?' The answer is generally in the negative: whereupon the adroit trades-

man steps up beside the stranger, and in a confidential manner whispers into his ear, 'Have you anything to sell, sir?' This sort of importunity is not, however, nearly so characteristic of Monmouth Street as of the more eastern depôts of cast-off garments near the Strand or Whitechapel. The truth is, Monmouth Street has a spice of aristocracy attached to it. It is one of the principal media by which the cast-off clothes of the nobility reach, through their servants and valets, the middle and poorer classes. In fact, fortunes have been made in Monmouth Street; its denizens, therefore, are in some small degree more civilised than their brethren of the east.

While it is a rule in Monmouth Street that the old-clothes dealers have the shops, and all the houses above them, the cellars are inhabited by a different race. They are almost invariably appropriated to the sale of old boots and shoes; and the passenger who walks along, and looks down as he goes, will see at the foot of every dirty stair leading from the street an industrious cobbler busily at work. Upon one side up the stairs, boots and shoes of all ages and sizes, rubbed thickly over with wax to hide their manifold deficiencies, are neatly arranged, while the other side is set apart for apples or sweetmeats, or now and then for cheap crockery, to be exchanged for old shoes with those who come to sell and not to buy. These wretched cellars, which receive no other light than the feeble glimmer that penetrates down the stair, are let at the enormous rentals of four, five, or six shillings a-week, unfurnished; and in these a family of eight or ten persons are cooped up, working, eating, and sleeping within the same dark, damp, unwholesome walls. If there is a father to the family, he is generally a cobbler, while the mother plies the mangle; and so 'cribbed and confined' are they of necessity, that the mangle not unfrequently does service for a table at dinner-time, and is made a bed for the younger branches of the family at night. Fresh air there is little or none. The floor is mostly of earth; and when it is not, the dirt has been known to accumulate until it became three inches thick upon the boards; and the whole so damp, that mushrooms have grown in the corners, and mosses in every scanty hole that was not trodden upon by the feet of its superabundant inhabitants. Any one who enters must stoop and walk backwards, like one who descends into the hold of a ship; and if he be not well acquainted with the ways of the place, he runs a risk of overthrowing some hundreds of pairs of old shoes, and—worse mishap still—as many pieces of crockery. Besides these, however, Monmouth Street has its more extensive firms in the second-hand boot and shoe line. There are several respectable people who, under pretence of corns and bunions, declare they cannot wear *new* leather, because it 'draws the feet.' These are the customers of the larger shops. Amongst the above-ground depôts, both for boots and clothes, there are some proprietors well known for their wealth, and who are talked respectfully of 'in the city': the capital they have accumulated in doctoring up boots, they largely employ in discounting bills.

The trade in cast-off ladies' clothes, largely carried on in Monmouth Street, is a mysterious subject, which, it must be honestly confessed, we are unable to fathom. What becomes of the faded satin gowns and crushed bonnets displayed at the door-posts; who may be the consumers of the second-hand artificial flowers, the mock jewellery, the cast-off hair-combs, the dilapidated fans, the broken feathers, the mended kid gloves, the darned lace, and the dirty packs of cards, which are displayed in the windows—we are at a loss to conjecture. The only clue to the mystery which we know of, is presented in the costume of the ladies who perform the fashionable characters at the minor theatres.

Monmouth Street puts on its best face on the Jews' and Christians' Sabbaths. The Hebrews, as we before hinted, have a great liking for the open air; consequently, on fine holiday evenings, some of them are to

be seen seated in chairs on the pavement before their shops, the men smoking pipes, and the women joining in moderate potations of porter; a pewter quart of which stands just inside the door on a little round table. Children are playing about. The whole group is well, perhaps elegantly dressed. Most of the Monmouth Street denizens are Jews, and that race are remarkably fond of fine clothes, disdaining shabby or second-hand articles for their own holiday use, as they love them for 'the sake of the profits' at other times.

In spite of a few cases of affluence, the general effect of the street upon strangers is far from inviting. It smells of old age and squalidness; its atmosphere seems as if no breath of heaven ever stirred it; the very leaves in the chandlers' shops look dirty and musty. The herings that dangle from the windows of the same receptacles appear as old and dried, and out of date, as the garments; the butter has a jaundiced and unclean look; and the eggs are of a yellow as dingy as the thickest fogs of London.

Altogether, Monmouth Street presents features which make it one of the most curious thoroughfares in London. It has been the receptacle of the crumbs and offals of fashion for nearly a century and a half; and a true history of its shops would be a correct history of British costume during that long period. Neither is it without its uses and benefits to the public. It helps to exemplify Mr Fisher Murray's axiom, that 'in London you can get anything you want at the moment you want it.' A man of limited means, having a sudden call for a suit of clothes, for instance, can obtain them at his own price in Monmouth Street at five minutes' warning. It is, we must admit, a dangerous market to deal in; for the Jews invariably ask you double the price which a thing is worth, or what they will, if hard pressed, consent to take. Lately, their trade in cast-off garments has suffered greatly from the introduction of cheap new clothing; some of which is manufactured by a process little better than 'duffing.' Rotten cloth rags, oakum, and other materials of an equally worthless kind, are reduced by machinery to a state which is called (we quote a well-known M.P.) 'devils' dust.' By dint of a vast deal of pressure, and a very little weaving of the fibrous material, a sort of cloth is produced, which, though it has a good outside appearance, possesses very little stability. Garments made of this description of stuff are so cheap that they have withdrawn much business from Monmouth Street.

'THE TRADE.'

THIRD ARTICLE.—BOOKSELLING ABROAD.

In treating of any subject respecting books, it is difficult to get away from Germany. There modern literature first took root, and, nurtured by the press, branched off into the 'utmost corners of the earth.' There also literary commerce has been reduced to a system more complete and effectual than in any other country in which 'the trade' flourishes. It is to Germany, therefore, that our present notices of the book-trade must be for a while confined.

Piracy and fraud are as old as bookselling itself. The ingenious devices of the dishonest kept pace with the extensive development of the book-trade by the printer's art; and as soon as a publisher became famous for the correctness and legible neatness of his editions, his name and 'marks' were fraudulently forged by inferior typographers, to insure a readier sale for works than their own merits would have procured. We must here digress for a moment, to say a word concerning the symbols adopted by the old booksellers, who were (and by the book-fancier still are) so well known by the devices they placed on their title-pages, that neither their name nor place of residence was necessary. Of these marks, the best known are as follows:—The

anchor, the sign adopted by Raphelengius of Leyden; an anchor, with a dolphin twisted round it, was the symbol of the Mavutti of Venice and Rome. The Stephenses of Paris and Geneva put forth the olive-tree; and the Elzevirs of Amsterdam adopted the same symbol. The signs of the Zodiac were likewise appropriated as marks by some publishers; while others constructed rebuses. Thus, Richard Harrison, an English printer, who died in 1563, printed on his title-pages a *hare*, a sheaf of *rye*, and a representation of the *sun*. William Norton, who, besides a bookseller, was treasurer of Christ's Hospital (1593), had a 'sweet *William*' growing out of a *tun*, inscribed with the word *nor*. Others equally puerile might be cited. The literary pirates who forged the marks of the best booksellers chiefly resided in Geneva and Vienna. In the last-named city, one J. Thomas Edler Von Trattner made himself as famous in the book-trade by the daring boldness of his piracies, as the Sallee rovers did amongst the shipping interests of the civilised world. No sooner had a printer put forth a carefully-prepared edition of some valued classic, than these forgers set their presses to work, and produced an exact imitation of it at a much lower price. This system had risen by the year 1765 to a pitch so ruinous to the regular trade, that the German publishers entered into a confederacy to put a stop to it. Erasmus Reich, one of the partners in the Weidmannsche Buchhandlung (an extensive publishing concern), called a meeting at Frankfurt, and proposed certain laws and regulations, the chief object of which was to tie down the booksellers of Germany not to sell any copies of the spurious editions. To this agreement fifty-nine booksellers subscribed. By the year 1797, the association spread its influence throughout the country, and ever since the latter year, no person can sell a book without being a member of the German booksellers' association (Deutschen Buchhändler Verein) of Leipzig, to which place the book-trade has since been concentrated. By means of this concentration, improvements have gradually been made in the organisation of the book-trade, until formed into the system it is at present—an explanation of which will be found interesting.

The book-trade of Germany is divided into three distinct branches—1st, That of the publisher (Verlagsgeschäft); 2d, The booksellers' business (Sortimentshandel); 3d, The agencies (Commissionsgeschäft). The first two branches are frequently united, and often all three are carried on together. The business of the publisher needs little description. He buys the manuscript from the author, and gets it printed, either by his own presses, or by other parties for his account, and sends copies to such booksellers as he thinks likely to sell the work. The invoice is fastened on the outside of the parcel, half folded up, so that only the head, bearing the name of the bookseller to whom it is directed, and the name of the publisher from whom it comes, is to be seen. The parcels are all put in one bale, and sent to the publisher's agent in Leipzig, who distributes them to the different agents in that town. Every respectable bookseller of Germany employs an agent in Leipzig. Such copies of new works are called 'Nova;' on the invoice is put 'pr. Nov.' (*pro Novitate*). They are sent 'on condition' (*à condition*), that is, with the option to keep them or to send them back. The returned books are properly called *remittere*, though more frequently and jocosely *krebee* (crabs). By such conditional consignments, private persons have the advantage of being able to look into the merit of a work before they are called upon to buy it, whereby new publications get to all parts of the country, and at the same price as at the place of publication—a system which is quite peculiar to the Ger-

man book-trade, and which has certainly contributed much to the diffusion of knowledge in Germany. The prices are put down either at the shop price or net price. On the shop price (ordinaire) a discount of one-third, or thirty-three and one-third per cent., is usually allowed by the publishers to 'the trade' for books, and for prints and journals one-fourth, or twenty-five per cent. Books which have been published for some time are seldom sent out 'on condition,' but must be ordered, which is done by sending a small slip of paper (Verlangszettel)—containing the name of the publisher, the name of the bookseller who orders, and the title of the work—to the agent of the publisher, who transmits the work by the first opportunity, and, if quickly wanted, by post. Every publisher of note sends some copies of his publications to his agent in Leipzig, in order that he may execute without delay any orders which may come in; so that the shortest and cheapest way of procuring a work is generally by sending to Leipzig for it.

At the New Year, at Easter, and at Michaelmas, the fairs before alluded to* are held at Leipzig, exclusively devoted to the sale of books. Of the three, however, the grand concentration of the trade takes place at Easter (Jubilatemesse); for that is the time when all accounts are, or should be, closed between the booksellers of various parts of Germany, who either attend the fair personally for that purpose, or send some confidential clerk.

Although the book-trade of Germany is centralised in Leipzig, yet it must not be supposed that it is exclusively conducted at the fairs. New publications, though usually first issued at them, are occasionally forwarded for general distribution in the monthly parcels, of which many thousand bales annually arrive, and are sent away. Thus, wherever a book may be printed, it is invariably published or issued in Leipzig; where every local *Sortimentshandler* has his *commissionär*, or agent. Instead, therefore, of applying directly to the local publisher for a new work, he sends to this commissioner in Leipzig, and through him the order reaches its destination. If a bookseller of Berlin, for instance, has ordered books from Vienna, Strasburg, Munich, Stuttgart, and a dozen other places, they are all transmitted to his Leipzig agent, who then forwards them in one mass much more cheaply than if each portion had been sent separately and directly to Berlin.

The censorship of the press, which is exercised in every state belonging to the German confederation, opposes a great and important hindrance to the prosperity of literature, especially in a commercial point of view. Each journal and publication under twenty sheets, whatever be the subject of which it treats—politics, literature, arts, or science—must be sent in manuscript to the censor, who strikes out what he thinks proper before the printing of it is allowed. The delay, and frequently arbitrary or capricious interference arising from this system, are evident; nor can it be denied that much bad feeling and discontent are thereby created. Moreover, not only all German books published in the country are subject to this censorship, but in some of the states all books imported from other states belonging to the German confederation are similarly treated. In Austria, for instance, all books coming from Prussia, or from the minor states of Germany, are considered as foreign books, and are subject to a second censorship in that country. They are either admitted free by the word 'Admittitur,' or admitted with the restriction not to be advertised ('*Transcat*'); sometimes they are to be delivered only to certain persons to whom the censorship has given special leave to receive them ('*Erga schedam*'); or they are totally prohibited ('*Damnatur*'). In Prussia, all books printed out of Germany in the German language must be laid before the College of Upper Censorship (Ober Censur Collegium) before the sale of them is allowed. These separate interests and separate laws prove very efficacious in encouraging

piracy. In Germany, neither author nor publisher has much chance of making a fortune; each state of the confederation having its own law of copyright, and the protection it affords of course only extends over the territory itself; hence, no sooner does a work of merit appear in one state than it is pirated by the next, and as the same language is common to the whole confederation, nothing more is wanted than a mere reprint. This practice affords an explanation of several peculiarities which attach to German bookselling. The most prominent of which are, firstly, the cheapness of literary labour; for a publisher cannot be expected to give much for a work which, if it be bad, has no sale, and if good, is forthwith stolen. Secondly, the frequency of publications by subscription; for there is no other method by which even authors of the greatest genius can secure a reasonable profit. Thirdly, the coarseness of paper and types for which German books are distinguished; for the publisher has no chance of competing with the pirate except by making his own edition too cheap to be undersold.

Despite these hindrances, however, 'the trade' flourishes. The number of German booksellers has so much increased within the last twenty years, that many of those who have been long established are complaining of underselling and other irregularities; but in that respect the older members of the trade may be said to suffer no more than their compeers in other branches of commerce, whose profits and modes of doing business are interfered with from competition set up through the demands of an augmenting population. The number of booksellers in Leipzig in 1839 was 116; the total number in Germany was 1233, who resided in 337 towns. Besides these, were 49 booksellers belonging to German-Switzerland, and 99 foreigners who regularly do business at the Leipzig fairs.* Since 1839, however, the number of foreign houses in connexion with Leipzig has increased, especially those of Great Britain. Several firms, both in London and Edinburgh, regularly attend at least one of the fairs yearly.

Having disposed of the book-trade of Germany, we now proceed to glance at that of Russia. Here the dawn of literature began with Peter the Great. The first book ever printed in the country was struck off at St Petersburg in 1713, and the first newspaper in the year following. Now there are 25 booksellers and printers at St Petersburg, besides several others at Moscow, Riga, Dorpat, Reval, Warsaw, and Wilna. Among the number are many German establishments, which supply that part of the population who speak the German language, and such of the natives as are fond of German literature, who are pretty numerous. In 1837, the number of new works published in Russia was 866, of which 740 were original, and 122 translated works. There were also 48 periodicals treating of politics and literature. The censorship of the press is extremely rigid.

Of the book-trade carried on in the more southern portions of Europe, Paris is the head quarters: we shall therefore treat of French bookselling in this place. In France there is no such organisation of the book-trade as in Germany. Paris is the great central point where almost all works of any renown are printed, and where the most distinguished men of letters, artists, and authors, are to be found. The booksellers of the departments, it is true, have also their agents in Paris, but they do not maintain such a regular and constant intercourse as those in Germany. Besides, the publishers (*Editeurs Libraires*) seldom send their publications '*à condition*;' the booksellers (*Marchands Libraires*) must order, and generally pay for them in cash. Sometimes, however, a credit of three, four, or six months is granted. The trade allowances are regulated not as in other countries, by the sale price, but by the subjects of the works. The discount on historical, critical, and elementary books, is twenty-five per cent.; that on mathematical and

* See p. 180 of our last number.

* See the Quarterly Journal of the Statistical Society, vol. III.

strictly scientific works, is from ten to fifteen per cent.; while upon romances, tales, and literature of the lighter order, it is often as high as fifty per cent. Literary censorship was early introduced into France, and exercised most severely. Charles IX. published an edict in 1563, by which he forbade printers to issue unauthorised works 'under pain of hanging or strangulation.' The censorship continued to be enforced down to the reign of Charles X., whose unfortunate ordonnance of the 27th July 1830, by which he would have further circumscribed the liberty of the press, produced the last French revolution. From that time the censorship was abolished; but a sort of substitute for it remains, in the very stringent laws against libel. In the year 1830, there were in France 620 printers, residing in 283 towns, and 1124 booksellers and stationers; all of whom are obliged to be *brevetés*, that is, licensed, and sworn to abide by certain prescribed rules. A Paris paper states that their press had produced within the last year as many as 6377 works in the dead and living languages, 1388 prints and engravings, 100 musical works, 54 maps and charts; whilst the copies of newspapers struck off amounted in number to 34,750,000.

In Italy there is no regular intercourse whatever among booksellers. It is only with the greatest trouble and expense that a work published in any part of Italy can be procured in a remote town not belonging to the same government. The counterfeiting of books is so prevalent, that one printed at Milan is counterfeited at Florence, and *vice versa*. The censorship also presses heavily on all kinds of publications, much more so than in Germany. The customs' duty on foreign works is so enormous, that it is cheaper to pirate popular books than to import them. In the kingdom of the Two Sicilies, each octavo volume has to pay 3 carlini, or 1s. entrance duty; a quarto volume 6 carlini; and a volume in folio 10 carlini, or 3s. 4d.

In Holland, the chief seat of the book-trade is Amsterdam, which boasts of 80 booksellers, who have adopted the German system in dealing with their provincial brethren, of whom there are 101. In 1828 there were published in Holland 770 new books. In Belgium, Brussels is almost the only town where works of any note are published. They consist principally of re-publications of French and English works, which are much in demand, on account of their neatness and cheapness. There are several extensive printing establishments at Brussels, and also a joint company of publishers, whose open and avowed aim is the counterfeiting of good French and English works, published often at the same time as the original edition, or very soon after. By the constitution of 25th February 1831, Belgium enjoys an extensive freedom of the press. In the year 1838, there appeared in Belgium 84 periodicals, of which 40 were published at Brussels.* In other continental countries, the trade carried on in books is almost nominal.

Before we glance at the book-trade at home—which we shall do in a concluding article—we must notice the increasing demand for foreign books which has recently taken place in Great Britain. From the continental peace, which, happily, has not been disturbed since 1815, the importation into this country of foreign works has steadily augmented. Free commercial intercourse once established with our continental brethren, intellectual and literary intercommunion followed; and to render this the more effectual, the French, German, and Italian languages have been of late extensively studied. Books in those languages (especially in the two former) have therefore been eagerly read, and a demand for them increases daily. Five-and-twenty years ago, there was no English bookseller who confined his trade exclusively to foreign books; now, there are at least fifty German, French, and Italian booksellers in London alone. In Edinburgh, there are three of 'the trade' who make the sale of foreign works a prominent feature in their busi-

ness. During the last ten years, an average of £8000 has been annually paid for duties on foreign works imported into Great Britain.* The value of such books imported in 1843 was £132,019.

DEER-STALKING IN GLENARTNEY.

[Extracted, with permission, from Sir T. D. Lander's beautiful volume descriptive of the Queen's Vliet to Scotland in 1842. Printed by T. Constable, Edinburgh, 1844.]

CLEAR and beautiful was the dawn of morning on Monday, the 12th of September, betokening weather perfectly delightful for carrying into effect the deer-stalking expedition to the forest of Glenartney, which Lord Willoughby de Eresby had planned for the amusement of his royal guest, Prince Albert.

Glenartney has been already alluded to when passing down Strathern, by Comrie, the river Ruchill there joining the Erne, having its origin in the forest. Let not the Cookney suppose that the word forest necessarily implies a district covered with noble oaks, chestnuts, or trees of any other description. The first meaning of the word may have been that of a wooded country, but in our old times it was applied to a large extent of surface, whether wooded or not, set apart by royal edict for the wild beasts and fowls of chase, certain laws being established within its precincts. A forest, as the word was strictly taken in early times, could not be in the hands of any one but the king; but, in later periods, forests have become the property of subjects, or have been created by them, though without being protected by forest laws. The royal forest in the Isle of Wight, in which there is not a tree, is not the only English example still remaining of the view here taken of this old meaning of the word. Where the soil was rich, such a tract of country, so appropriated, naturally became woodland, and in this way the original meaning of the word may have again become applicable. From this cause, the forests long appropriated in Scotland as a range for red-deer, may have some woods about their lower outskirts, as that of Braemar and some others; but, in general, they are altogether devoid of trees, or even bushes, the defences of the stag consisting in the wild nature of the ground—its bareness, which allows him to see strange objects at the distance of several miles from the spot where he and his hinds may be feeding—and in the strongholds of the steep and lofty mountains, in the seamed parts of which are found those large hollows sloping outwards, surrounded on three sides by high and frequently inaccessible and often shivered precipices, called, in deer-stalking language, by their Gaelic name of corries, in which the deer delight to dwell, and from which they issue to bound upwards to the breezy ridges of the mountains for better outlook, or to follow the rills that issue from them downwards to better pasture below. He who, in painting an ideal picture of a Highland forest, therefore, should select a portion of the noble oak scenery of the New Forest, or of Windsor, for his study from nature, would commit a most lamentable error.

The forest of Glenartney has, on its north and western borders, the high mountains of Stuck-a-chrom, Benvoirllich, and their associates, rising out of the southern side of Looherne. The deer have it thus in their power to occupy some lofty positions, and the intricacies produced by the lower supports of these mountains are such as to give them great advantages. The forest abounds in streams, having rich vegetation on their banks, and its whole surface is naturally good deer pasture. In the words of old Donald Cameron, Lord Willoughby's head forester, who has now been in Glenartney upwards of forty years, 'The nature of the ground is good and healthy, interspersed with heath and rushes, and natural grass, and it is beautiful to the eye of a traveller—that is, to the eye of a traveller who, like Donald, has all his life been looking after deer—or to the eye of the enthusiastic traveller, who loves to look upon nature in some of her wildest forms; but for the eye that loves the deep repose of nature, beneath the giant limbs of oaks, whose thick-set tops, spreading over roofs of ground, produce an ever-enduring shade throughout the whole of the grand aisles of that leafy edifice, supported by their huge and knotted stems, save where a transient sunbeam

* This duty was, on books printed previous to 1801, £1 per cwt.; on those printed after, £5. By the new tariff of 1843, the latter item is reduced to £2 10s. per cwt.

* See the Quarterly Journal of the Statistical Society, vol. III.

may break through some accidental opening above to chequer the solemn ground—such a scene as Glenartney would be absolute barrenness.

It had been announced by Lord Willoughby that Mr Campbell of Monzie, one of the most active deer-stalkers in Scotland, and one who is well acquainted with every foot of the forest of Glenartney, should accompany Prince Albert to the forest, for the purpose of taking him up to a deer. The prince and Lord Willoughby set out in an open carriage and four for the lodge of Dalclathick, at six o'clock in the morning, attended by his royal highness's jüger. The distance to the lodge is ten miles; and, on reaching it at seven o'clock, they found Mr Campbell of Monzie, and Donald Cameron, faithful to *tryst*.

The moment the open carriage stopped, the prince laid his hand on its side, and vaulted lightly out upon the ground. Advancing towards Monzie with the utmost affability, he said, "Mr Campbell, I understand you are to show me the forest, and how to kill a deer?" Monzie replied he had been informed that he was to have that honour. He trusted that the prince would excuse that free-masonry which was essential in deer-stalking, as it was hopeless to attempt to succeed without it, and that for himself he was not one of the court, courtly, and would require the indulgence of his royal highness. The prince assured him that he would place himself entirely under his guidance, and that he would follow it implicitly. He then put some questions about the weather—asked whether it was favourable for the sport, and inquired whether his dress, which was a gray Glengarry bonnet, with a shooting-coat and trousers of the same colour, would do for deer-stalking; and on Monzie assuring him that it was in all respects perfect, he proposed starting immediately for the mountains of the forest, which were seen rising in huge and lofty masses at some miles' distance towards the north. A Highland pony was in readiness, which he mounted. Lord Willoughby and Mr Campbell both offered to carry his rifle, but this he would by no means allow, and he instantly slung it over his own back, saying, 'I am riding, and you are walking,' and from thenceforward the prince continued to carry it himself during the whole day. Lord Willoughby had arranged that the party should include no one but the individuals already mentioned, as nothing is more destructive to deer-stalking than being followed by 'a *taiz*.' It happened, from some accident, that Monzie did not bring any hounds with him.

The party now went rapidly up the side of the forest burn, and after a considerable walk, Monzie discovered a large herd of deer on the brow of Coir-eangain, or the Hindsback-corry. The prince's eye glistened with delight; and certainly never were deer beheld to greater advantage, for the morning sun now shone fully upon them; and there is no position in which those antlered denizens of the mountains appear so gloriously as when thus seen on a breezy brow, high above the hunter's eye, with their coats glistening under as bright a sun as then shone upon them, and with so clear a sky behind—all these circumstances tending to make them look as aerial as those not very deeply learned in the mysteries of deer-stalking frequently find them to be.

As it was manifestly impossible to stalk these deer directly from hence, they hastened up the march burn, with the intention of getting to a pass to the northward of the base of Coir-eangain, with the hope that they might move thither. But they were so wild, and the ground so smooth, that they changed their position, and went too high up the hill to enable the deer-stalkers to effect their object as at first planned. They were now, therefore, compelled to change their strategy, and to make a hasty detour by Leathad-na-Sgeith, or the Wing Brae, so as to endeavour to meet the herd as they were in the act of crossing from Coir-eangain into Coir-gairian. To effect this, they had to go round the foot of Coir-eangain, and then to climb to the summit of the highest ridge of mountains extending round the forest. This involved the necessity of a smart and arduous walk of an hour.

After they had gone about half-way up the mountain, the prince dismounted for the day. The party then moved on in Indian files, and in deep silence, though at a very rapid pace, towards the brow of the hill above Coir-coinean (Coir-coin-thirm, White Hound Corry). The deer made a slight check there, and appeared disposed to break at another part of the hill; but finally, they set their heads straight for Coir-coinean. It then became a race whether deer or deer-stalkers should get thither first; and after a

great deal of toil and fatigue, it terminated considerably in favour of the deer; for just as the prince got to the point whence the shot is usually obtained, the hindmost of the herd were dropping out of sight into Coir-coinean. But Prince Albert seized his rifle, and though the deer nearest to him could not have been at a less distance than 150 yards, and bounding at full speed, he fired and wounded it. It was afterwards found within a few hundred yards of the place where the shot was fired; but at that moment circumstances were too exciting to allow them to look for it, as they expected that some of those in advance would hear the report, and move. The prince, indeed, not aware that his shot had been fatal, was doomed, whilst his rifle was reloading, to experience that feeling of mingled delight and regret to which every deer-stalker is exposed when beholding the glorious spectacle of a noble herd sweeping rapidly into the gloomy shadow of the glen below, the serenity of his passing thoughts being at the same time disturbed by the consciousness that one of them 'hath ta'en a hurt'; and that, after all, his hope of getting him is but small indeed; for every one who has followed this princely sport must know full well that nothing short of instant death, which is but rarely produced, can secure the immediate possession of a deer. The view from the summit above Leathad-na-Sgeith is one of the grandest in the whole forest; for, at the foot of the deep Coir-coinean, the yet more profound and much more rugged Glen-Coinean opens to the eye, and carries it on through a long perspective of barren wildness and magnificence, one huge form succeeding another, till the flight of human vision rests on the snow-clad summit of Benvoirlich. The contemplation of this wild Highland scene, with the dusky deer darting away far off in the glen, called forth a burst of admiration from the prince worthy of the most enthusiastic mountaineer, and which would have gratified any true Highland heart.

Again the party proceeded with great expedition, in the hope of meeting some deer which they saw before them near Stuo-na-cabaig, or the Cheese Cliff. When they had almost reached the top of the Stron, it became necessary to advance more leisurely, and with some degree of caution, and having got to a place a little way from the brow of the hill, they began to move forward on their knees, as there was reason to hope that the deer were at no great distance. As it was absolutely essential that silence should be preserved, Monzie whispered to the old forster, 'Hold the prince back, Donald, whilst I creep to the brow to see where the deer are.' 'Hoo am I to do that?' replied Donald Cameron. 'Just lay hold of his arm if the deer come forward, until it is time to fire.' 'Haud the prince!' said Donald, with a degree of astonishment which, forty years' deer-stalker as he was, had nearly deprived him of his presence of mind—'haud the prince! I'll no do that. Ye mair just grip him yoursel, Monzie, and I'll look ower the broo.' Monzie was obliged to consent to old Donald's arrangement, and, to insure success, was compelled to take the necessary liberty with the prince's arm. The herd did not come forward, but turned back round the hill. Indeed the wind was so unsteady, and shifted so often during that day, that the deer were wilder, and much more difficult to approach, than Monzie, or even old Donald himself, had ever before seen them. But throughout all the vicissitudes of the sport to which the prince was exposed, whilst he was quite as eager as any other young deer-stalker, he exhibited a patience and good-humour under disappointment which few old ones have ever possessed; and well indeed were these qualities tried during that day. Shortly after this they descried a single deer standing by himself on a brow considerably in advance, and somewhat below them. The prince had by this time shown so much promptly-acquired knowledge of the work, that his conductor was anxious he should stalk this deer by himself, and his royal highness was equally desirous to make the attempt. Off he set, therefore, entirely alone, creeping and wading on his hands and knees through a long succession of wet moss hags, sinking deep into their black chaos, now unseen, and then again appearing, until at length, when he had been for some time out of sight, the smoke of his rifle curled up from behind a knoll, its smart crack was heard, and although it turned out that the deer had gone off, it was afterwards retrieved.

The party then proceeded to the Stron-nam-breidhleg, or Cranberry Snout. Just before reaching it, the prince fired at a deer and broke its leg. It has already been said that they had no deer-hounds with them; but one of the

under foresters having joined them a little before this, they left him to look after and watch the movements of the wounded animal, and hurried forward to the brow of a hill at the back of the Stron, as they saw a herd making for a pass in a small rocky burn before them. They were pushing on in Indian file, and in double quick time, through some deep moss hags, the prince walking as if he had been a native of these mountains, when Monzie suddenly descried the points of a horn appearing over a brow below. Thus immediately perceiving that the herd had changed its course, he had just time to seize the prince's arm with his left hand, and to reach the nearest part of old Donald's ancient person with the toe of his right foot—such liberties being considered as quite complimentary in deer-stalking, and at all times extremely gratifying, as conveying the pleasing intelligence that there are deer in sight. The prince and Monzie squatted like hares in their forms, and down went Donald on his back, partly from the kick, and partly from instinctive feeling; but it was this last that twitched up his features into that exquisite grin of happiness with which his countenance was moved as he lay on his back among the heather. All three were thus concealed from the deer, and the herd continued to draw slowly over the brow where they first appeared, and passed round the hill. Now came that glorious and exciting moment in deer-stalking, when the prospect of having your most sanguine hopes crowned with success is immediate, and where, at the same time, the smallest untoward accident may altogether blast them. The prince eagerly demanded, 'What am I to do?' 'Up! up!' cried Monzie. 'Nothing for it now but a rush down that moss hag; never mind the wet!' But he might have spared the latter advice; for before the words were well uttered, the prince was deep in the mysteries of that sable compound of vegetable matter, to explain the nature of which so many large volumes have been written both by philosophical and practical men. Down, down they sped, sometimes running in that most painful of all positions, with the legs straight, and the back bent till the face almost touches the ground, and sometimes ploughing through the black bog on hands and knees, utterly regardless of future personal appearance, as well as of those awkward salutations which their limbs met with from knaggy roots of antediluvian trees deeply concealed in the soft and sinking matter. The deer was all they thought of. And they just succeeded; for, by thus slanting the hill, they were enabled to arrive at a point precisely as the herd was crossing their line of advance at some little distance below them. The prince had only time to discharge one barrel before the herd disappeared from his sight. By that peculiar sound which is so gratifying to the ear of a deer-stalker, it was known that the ball had told, and some hair was observed to be *dusted* out of the point of the shoulder. His royal highness thought he had missed, and seemed somewhat incredulous when Monzie told him where he had seen the ball hit. But all doubt upon the question was speedily removed; for, while they were reloading the rifle, Donald trotted onwards a few hundred yards and came to a sudden stop, and with his eyes fixed on the ground like a pointer on game, began to fumble for his skian-dhu. 'Ha!' exclaimed the prince, 'he stops—he takes out his knife—it is dead!' And dead indeed it was; for on going up to it, there it lay with a hole through the point of the shoulder just as Monzie had said. 'Ah!' exclaimed the prince, 'it is a hind. I am so sorry that it is not a stag, for I promised the teeth of the first I killed to the queen.' The teeth, which are considered by the superstitious as a charm against the evil eye, are likewise preserved as trophies by deer-stalkers, and various little ornaments are made of them, such as beautiful studs or buttons. It must be observed that this was the first deer that had dropped to hand, though those previously fired at were afterwards retrieved.

They now fell back round the hill into Coir-dhu, where much time was lost in waiting in vain for deer. Although every 'dodge' was tried, there was no getting them to move towards the pass. 'Have you killed many deer,' demanded the prince of Monzie, 'for I hear you are a great deer-stalker?' Monzie replied that he had shot about forty last year. 'Ah!' said the prince jocularly, 'that is the reason they will not come to me, for they know you are with me.' They did come at last, however, but so irregularly, and they rattled so rapidly down a hill, that his chance was a very poor one. He fired notwithstanding, and again that short deafened sound, which it is as impossible for an experienced hunter to mistake as it is

to describe, announced that the deer was hit, and he was accordingly found some hundred yards below.

The day being considerably advanced, they now turned their faces homeward, as Prince Albert was most anxious to accompany her majesty in her drive. In their way, they tried for another deer at the back of Leathad-na-Sgeith; but the herd having been previously disturbed, they found it impossible either to stalk or to drive them, as they are wont to do on such occasions; the animals kept continually wheeling round and round in a constant succession of evolutions, such as deer alone can accomplish. Every effort was made by the deer-stalkers, but without success, as, in spite of all their exertions, the herd broke away through a pass leading over the very summit of the mountain, and as the prince was stationed at the bottom of the hill, he was disappointed of a shot; and thus ended the chase.

Prince Albert would not wait for the pony to be brought to him, but proceeded on foot to the lodge at Dalclathick, where luncheon was prepared. His royal highness pressed Lord Willoughby and Mr Campbell to sit down with him, and on their declining to do so, he filled three glasses of champagne, and presenting one to each, drank the third himself to their healths, thanking them at the same time for the excellent sport he had enjoyed. Though Lord Willoughby de Eresby did not always go with the prince directly up to the places where he expected to have shots, yet he followed his royal highness the whole day with a rifle in his hand. The prince and Lord Willoughby got into the carriage, and drove off to Drummond Castle, which they reached by three o'clock. This day's slaughter produced two stags and three hinds, the trophies of which were all collected and sent to Windsor.

MADEMOISELLE LENORMAND.

THE French have been accused of incredulity and want of faith in matters of high and weighty import. How far this may be true we are not now about to inquire; but the sum of 500,000 francs, amassed by Mademoiselle Lenormand, the celebrated fortune-teller, testifies strongly to the credulity of the nation in subjects on which a want of faith might justly be defended. And that credulity, strange to say, was manifested at a time when what were called the fetters of ancient superstition were cast aside by a large portion of society. Moreover, in the character of this far-famed prophetess there does not seem to have been any remarkable elevation, or any great display of intellect. A few fortunate coincidences, an unbounded self-confidence, and considerable shrewdness, were the groundwork of her fortunes, and served to call forth, in a singularly striking form, the weakness of many of the most celebrated characters of the last half century; though it must be acknowledged that her own countrymen alone were not the dupes of her imposture.

The father of Mademoiselle Lenormand was of Falaise; but having married a Mademoiselle Guilbert of Alençon, he established himself in the latter city, where the celebrated fortune-teller was born, besides a younger sister, and a brother who entered the military service. M. Lenormand died young, and his widow, who re-married, did not long survive her second nuptials. The second husband also soon consoled himself for his loss, and took another wife; by which event Mademoiselle Lenormand, her brother and sister, became dependent on the care of a father and mother-in-law; who, to be quit of a young family which did not belong to them, placed the daughters in a convent of Benedictine nuns in the town; from whence, when they had learned all that the good sisters could teach, they were removed to that of the Visitation; and so on through all the convents of Alençon in their turn, after which the future prophetess was apprenticed to a milliner. It was in the house of the Benedictines that Mademoiselle commenced her vocation, by predicting that the superior would soon be deprived of her office; for which ill-boding the young lady was subjected to punishment, and underwent a penance; but the event soon justified the prediction. She continued the career she had begun by announcing the name, age, and various

other particulars respecting the successor of the deprived abbess. There were at the time many candidates for the office, and the ultimate decision remained in doubt and abeyance. Verifying at length the truth of the oracle, it confirmed the pretensions of the damsel to a supernatural power of revealing the events of futurity. But the town of Alençon was too confined a theatre for her aspiring disposition, and the needle too ignoble an instrument for one who aspired to wield the wand of prophecy. She persuaded her mother-in-law to send her to Paris, where her stepfather was then residing; and at fourteen years of age Mademoiselle Lenormand started for the metropolis, with no other worldly possessions than the clothes on her back, and a piece of six francs in her pocket, given to her by her maternal guardian.

Arrived in the great city, her father-in-law obtained for the young adventuress a place in a shop, where she soon gained the good-will of her employers, and *la grosse Normande* became a universal favourite. One of the clerks undertook to instruct her in arithmetic and book-keeping, and gave her some knowledge also of mathematics. Pursuing her studies with great industry, she soon surpassed her instructor, and resolved, after a time, to gain the means of subsistence by her own exertions, and in a manner congenial to her habits and inclinations. To this end she established in the Rue de Tournon a *bureau d'écriture*, which succeeded well, and where she continued to exercise her vocation as a prophetess till the time of her death in 1843. Her success enabled her, after a time, to get her sister married as she desired, and to promote her brother in his military career. It was towards the end of the reign of Louis XVI. that Mademoiselle Lenormand commenced practice. She found the troubles of the times, which unhooked the minds of all around her, and filled them with alarm and anxiety, very propitious to her views. The unfortunate Princess de Lamballe, whose untimely fate she predicted, was one of her frequent visitors; and she possessed a letter from Mirabeau, written from his prison at Vincennes, in which he intreated her to tell him when his captivity would cease. The Revolution followed, and applicants for the benefit of her oracular powers increased. Alarmed at the rapid progress of events, and rendered superstitious by their fears, crowds of anxious inquirers flocked to the Rue de Tournon under various disguises, which it required no great shrewdness or talent to discover. It was at this time that two French guards who had joined the crowd in the attack on the Bastille visited the celebrated reader of futurity: to one she predicted a short but glorious military career, and an early death by poison; to the other the baton of a marshal of France. The former was afterwards General Hoche, whose untimely fate fulfilled the augury; the other the celebrated Lefebvre. The Comte de Provence (afterwards Louis XVIII.), on the night of his flight from Paris, sent to consult the sybil of the Rue de Tournon, 'en qualité de voisine,' previous to his departure.

During the Reign of Terror, Mademoiselle Lenormand continued for some time undisturbed in the exercise of her divination, and was visited one evening by three men, who demanded with smiles of evident incredulity to learn their future destiny. On examining their hands attentively, she became greatly agitated, probably knowing the parties she had to deal with; they encouraged her, however, to speak without fear, as they were ready, they said, to hear whatever doom she should pronounce. For some time she remained silent, and continued to examine the cards apparently with great attention, but evidently under considerable excitement; yielding at length to their encouragement, she foretold their destiny, and, tragic as it was, her visitors received the prophecy with shouts of incredulous laughter. 'The oracle has failed for once,' observed one of them; 'if we are destined to destruction, we shall at least fall at the same time; it cannot be that I should be the first victim, and receive such splendid honours after

death, whilst the people shall heap your last moments with every possible insult.' 'She slanders the citizens, and should answer for it at the tribunal,' observed the youngest of the party. 'Bah!' replied the third; 'the dreams of prophecy are never worth regarding.' The death of Marat, one of the inquirers, soon after, confirmed the first part of the prediction; and the completion of the second alone saved the prophetess from destruction, she being incarcerated when Robespierre and St Just, the other two visitors, met the destiny she had foretold them. How it chanced that the science of Mademoiselle did not guard her against the danger in which she was involved, is nowhere recorded. Occupied, we must suppose, with the destiny of others, she seems to have neglected to read her own, and fell into perils she might otherwise have avoided by examining the lines in her own fair palm, or dealing out the cards for once for her own information and instruction. Yet that she really had faith in her own power of divination, seems to be proved by her conduct with regard to her brother, who, as has been stated, was in the army. Receiving intelligence that he was severely wounded in an engagement, she never ceased seeking, by means of the cards, to know the state of his health; and at length, after having passed a night in various cabalistic researches, she was found in the morning by her attendant bathed in tears, and gave orders for mourning, having ascertained, she said, that her brother was dead; which was soon afterwards confirmed by the arrival of letters.

After the Reign of Terror, the celebrity of the prophetess continued to increase. Barrère was one of her constant visitors. Madame Tallien seldom allowed a week to pass without availing herself of her supernatural powers. Barras frequently sent for her to the Luxembourg. From the access she had to the leaders of all parties, it required no great skill in divination to predict many of the events which took place at that time. The empire was, however, the season of her richest harvest. Josephine, as is generally known, was a firm believer in auguries and prophetic intimations. The early prediction of her future greatness, and its termination, has been so frequently repeated, without receiving any contradiction, that it is become a fact which no one questions, and would easily account for the firm faith she reposed in the oracles of Mademoiselle Lenormand, to whom she constantly sent to ask, amidst other questions, explanations respecting the dreams of Napoleon; and when the latter projected any new enterprise, the empress never failed to consult the reader of futurity as to its results. The disasters of the Russian campaign, it is said, were clearly predicted by Mademoiselle Lenormand; and it was from her also that Josephine received the first intimations of the divorce which was in contemplation, which premature revelation, unfortunately for the authoress, procured for her an interview with Fouché, who, on her being introduced, inquired, in a tone of raillery, if the cards had informed her of the arrest which awaited her? 'No,' she replied; 'I thought I was summoned here for a consultation, and have brought them with me;' at the same time dealing them out upon the table of the minister of police without any apparent embarrassment. Without mentioning the divorce, Fouché began to reproach her with many of the prophecies she had lately uttered; and which, notwithstanding the kindness she had received from the empress, had been employed to flatter the hopes of the royalists in the Faubourg St Germain. Mademoiselle Lenormand continued to deal the cards, repeating to herself in an under tone, 'The knave of clubs! again the knave of clubs!' Fouché continued his reprimands, and informed her that, however lightly she might be disposed to regard the matter, he was about to send her to prison, where she would probably remain for a considerable time.

'How do you know that?' asked the prophetess. 'Here is the knave of clubs again, who will set me free sooner than you expect.'

'Ah, the knave of clubs will have the credit of it, will he?'

'Yes, the knave of clubs represents your successor in office—the Duc de Rovigo.'

The fall of Napoleon brought fresh credit and honour to Mademoiselle Lenormand. She had foretold the restoration of the Bourbons, and received the rewards of divination. The Emperor Alexander visited and consulted her; and her old patron, Louis XVIII., again availed himself of her science and advice. But it was not the monarchs of Europe alone that gave their support to this singular woman. Prince Talleyrand, with all his incredulity, and with all his knowledge of man, and Madame de Staël, with all her boasted talents and wisdom, both were carried away in the general delusion.

It was during the consulate, when Madame de Staël returned to Paris, after a lengthened absence, that she allowed herself to be persuaded to make a visit to the Rue de Tournon. In the course of conversation, Mademoiselle Lenormand observed, 'You are anxious about some event which will probably take place to-morrow, but from which you will receive very little satisfaction.' On the succeeding day, Madame de Staël was to have an audience of the first consul, who well knew her pretensions, and was but little disposed to yield to them. Madame, however, flattered herself that the power of her genius, and the charms of her conversation, would overcome the prejudice she was aware he had conceived against her. The lady was received in the midst of a numerous circle, and fully expected to produce a brilliant effect upon Bonaparte, and all who surrounded him. On her being introduced, the consul abruptly asked, 'Have you seen *la pie voleuse*, which is so much in fashion?' Surprised at the unexpected question, Madame de Staël hesitated a moment for a reply. 'On dit,' he added; 'we are soon to have *la pie sedicieuse* also.' The second observation completed the lady's confusion; and the first consul, not wishing to increase it, turned and entered into conversation with some more favoured visitor. After this memorable audience, Madame de Staël called to mind the observation of Mademoiselle Lenormand, and from that time had great confidence in her skill, paying her many subsequent visits.

The residence of the prophetess for forty years was at the extremity of a court (No. 5, Rue de Tournon), and over the door was inscribed, 'Mademoiselle Lenormand, Libraire.' The profession of a prophetess not being recognised by the code, she took a 'patente de libraire,' to receive her visitors and exercise her vocation, without giving offence to the prefect de police or his agents; and, under the title of librarian, her name is inscribed in the royal and national almanac. On ringing at the door of the oracular abode, a servant appeared, and you were introduced into an apartment in which there was nothing extraordinary. So well was the character of Mademoiselle established, that no additional means of imposture were requisite to support it. Some thirty or forty volumes were arranged on shelves against the wall, chiefly consisting of the works of the lady herself—'Les Souvenirs Prophétiques,' 'La Réponse à Mon. Hoffman, journaliste,' 'Les Mémoires Historiques,' and five or six other works chiefly on cabalistic subjects. Mademoiselle soon made her appearance—a short fat little woman, with a ruddy face, overshadowed by the abundant curls of a flaxen wig, and surmounted by a semi-oriental turban, the rest of her attire being much in the style of a butter-woman.

'What is your pleasure?' she demanded of her visitor.

'Mademoiselle, I come to consult you.'

'Well, sit down; what course of inquiries do you wish to make? I have them at all prices; from six, to ten, twenty, or four hundred francs.'

'I wish for information to the amount of a louis-d'or.'

'Very well; come to this table; sit down, and give me your left hand.' Then followed several queries—'What is your age? What is your favourite flower? To what animal have you the greatest repugnance?' During the course of her questions she continued shuffling the cards; and at length presenting them, desired you to cut them with your left hand. She then dealt them out upon the table one by one, at the same time proclaiming your future fate with a volubility that rendered it very difficult to follow up all she said, and as if she were reading with great rapidity from a printed book. In this torrent of words, sometimes quite unintelligible, occasionally occurred something which particularly struck the inquirer, whose character, tastes, and habits, she sometimes described very accurately, probably in part from phrenological observation. Very often she mentioned remarkable circumstances in their past life with great correctness, at the same time predicting future events, which many of her visitors found to be afterwards realised. Of the failures, probably innumerable, nothing was heard. In justice to the lady, it must however be observed, that her natural shrewdness and observation frequently enabled her to give advice which was of considerable advantage to the inquirer.

Mademoiselle Lenormand, notwithstanding the favours she received from the emperor and Josephine, was a steady and devoted adherent to the elder branch of the Bourbons; and, after the revolution of July, retired very much from her usual business, both in consequence of her age, and from the diminution of her visitors; passing much of her time at Alençon, where she purchased lands and houses, and built herself a residence which she called 'La petite maison de Socrate.' Remembering the little honour a prophet receives in his own country, she refused to exercise her vocation in her native town, saying that she came to Alençon to forget that she was a 'devineresse,' and only calculated horoscopes at Paris.

How far she believed in her own skill, cannot be exactly ascertained; but from the fact relative to her brother's death, she seems decidedly to have had some faith in the revelations she drew from cards. Another instance is recorded in which she acted from some principle analogous to those from which her conclusions were sometimes drawn. At the time of the first invasion by the allies, Mademoiselle Lenormand had beside her a considerable sum of money, and many articles of value, which she was anxious to intrust to some one in whom she could place confidence. The only person who presented himself at the time was not much known to her, but at the moment there was no one else to whom she chose to address herself. 'To what animal,' she asked in her usual routine, 'have you the most repugnance?' 'To rats,' was the reply. 'It is the sign of a good conscience,' she observed. 'And to which do you give the preference?' 'Oh, I prefer dogs far beyond all others.' Mademoiselle, without hesitation, committed the important charge to his care, as one in whom she could place entire confidence.

The prophetess was in person excessively fat and ugly; but her eyes even in age preserved their brightness and vivacity, and the good citizens of Alençon were wont to say, 'Que ses yeux flamboyants leur faisaient peur.' It was never understood that Mademoiselle Lenormand showed the smallest inclination to marriage, nor was there ever a question on the subject; but she was well known to have a great aversion to young children. Besides a large funded property, and her houses and lands at Alençon, she possessed a very handsome house in the Rue de la Santé at Paris; a chateau at Poissy, eight leagues from the metropolis; and a large collection of very good pictures, principally representing the acts and deeds of members of the house of Bourbon; also a vast collection of very curious notes respecting the events of which she was either a spectator or an actress, all written in her own hand, which, by the by, is a most cabalistic-looking scrawl. She had also autographic and confidential letters from most of the evo-

* The Thieving Magpie, a play so called; the same, we presume, as that called in English the Maid and the Magpie.

reigns of Europe, and was in fact a remarkable proof of the credulity of the nineteenth century, and of an imposture which, for its long and continued success, has had few rivals in any age of the world.

Of the two children of her sister, which she adopted after their mother's death, the daughter died young of consumption, and the son is now an officer of rank. On the decease of his aunt during the last year, he inherited all her property.

[The above article is communicated by an English gentleman residing in France. We would be understood as not pledging ourselves for the literal correctness of all its statements, though neither have we any reason to doubt that it has been prepared from the best sources of information which may be available in the case.—Ed.]

READING WORKS OF FICTION.

There has been considerable difference of opinion in regard to the effects produced upon the mind by fictitious narratives. Without entering minutely upon the merits of this controversy, I think that it may be contended that two evils are likely to arise from much indulgence in works of fiction. The one is a tendency to give way to the wild play of the imagination—a practice most deleterious both to the intellectual and moral habits. The other is a disruption of the harmony that ought to exist between the moral emotions and the conduct—a principle of extensive and important influence. In the healthy state of the moral feelings, for example, the emotion of sympathy excited by a tale of sorrow ought to be followed by some efforts for the relief of the sufferer. When such relations in real life are listened to from time to time without any such efforts, the emotion gradually becomes weakened, and that moral condition is produced which we call selfishness or darkness of heart. Fictitious tales of sorrow appear to have a similar tendency—the emotion is produced without the corresponding conduct; and when this habit has been much indulged, the result seems to be, that a cold and barren sentimentalism is produced, instead of the habit of active benevolence. If fictitious narratives be employed for depicting scenes of vice, another evil of the greatest magnitude is likely to result from them, even though the conduct exhibited should be shown to end in remorse and misery; for, by the mere familiarity with vice, an injury is done to the youthful mind, which is in no degree compensated by the moral at the close. Imagination, therefore, is a mental power of extensive influence, and capable of being turned to important purposes in the cultivation of individual character. But to be so, it must be kept under the strict control of reason and virtue. If it be allowed to wander at discretion through scenes of imagined wealth, ambition, frivolity, or pleasure, it tends to draw the mind from the important pursuits of life, to weaken the habits of attention, and to impair the judgment. It tends in a most material manner to prevent the due exercise of those nobler powers which are directed to the cultivation both of science and virtue.—*Dr Abercrombie.*

LIEBIG WHEN A BOY.

Liebig was distinguished at school as 'booby,' the only talent then cultivated in German schools being verbal memory. On one occasion, being sneeringly asked by the master what he proposed to become, since he was so bad a scholar, and answering that he would be a chemist, the whole school burst into a laugh of derision. Not long ago, Liebig saw his old schoolmaster, who feelingly lamented his own former blindness. The only boy in the same school who ever disputed with Liebig the station of 'booby' was one who never could learn his lesson by heart, but was continually composing music, and writing it down by stealth in school. This same individual Liebig lately found at Vienna, distinguished as a composer, and conductor of the Imperial Opera-House. I think his name is Reuling. It is to be hoped that a more rational system of school instruction is now gaining ground. Can anything be more absurd or detestable than a system which made Walter Scott and Justus Liebig 'boobies' at school, and so effectually concealed their natural talents, that, for example, Liebig was often lectured before the whole school on his being sure to cause misery and broken hearts to his parents, while he was all the time conscious, as the above anecdote proves, of the possession of talents similar in kind to those he has since displayed.—*Dr Gregory on the Head and Character of Liebig, in the Phrenological Journal.*

THOMAS CAMPBELL'S 'ADVERTISEMENT.'

A correspondent points out that the writer of *Mornings with Thomas Campbell*, published in the *Journal* a few weeks ago (No. 58), has somewhat misunderstood the poet's account of his fancy for the beautiful child whom he met in St James's Park. What the author of the *Pleasures of Hope* sent to the newspapers was the following *jeu d'esprit* :—

LINES ON HIS NEW CHILD-SWEETHEART,

BY THOMAS CAMPBELL.

I hold it a religious duty,
To love and worship children's beauty;
They've least the taint of earthly clod—
They're freshest from the hand of God.
With heavenly looks, they make us sure
The Heaven that made them must be pure:
We love them not in earthly fashion,
But with a beatific passion.

I chanced to be, yesterday, behold
A maiden child of beauty's mould;
'Twas near—more sacred was the scene—
The palace of our patriot queen:
The little charmer, to my view,
Was sculpture brought to life anew.
Her eyes had a poetic glow,
Her pouting mouth was Cupid's bow;
And through her frock I could descry
Her neck and shoulders' symmetry;
'Twas obvious, from her walk and gait,
Her limbs were beautifully straight.
I stopped the enchantress, and was told,
Though tall, she was but four years old.
Her guide so grave an aspect bore,
I could not ask a question more;
But followed her. The little one
Threw backward ever and anon
Her lovely neck, as if to say,
'I know you love me, *Miss Grey*;
For by its instinct childhood's eye
Is shrewd in physiognomy;
They well distinguish fawning art
From sterling fondness of the heart.

And so she flirted, like a true
Good woman, till we bade adieu!
'Twas then I with regret grew wild—
Oh! beautiful, interesting child!
Why asked I not thy home and name?
My courage failed me—more's the shame.
But where abides this jewel rare?
Oh! ye that own her, tell me where!
For sad it makes my heart and sore,
To think I ne'er may meet her more.

Our correspondent adds, that the lines were answered in a poetical address by a member of the young lady's family, who fully appreciated the honour he had done them.

SANITARY OR SANATORY.

We hear much now-a-days of sanitary inquiries, the sanitary state of towns and districts, and so forth. At a time when the word is so much used, it may not be amiss to devote ten lines to denote the fact, that the proper word in these cases is *sanitary*. Sanatory, from the supine of *sano*, I heal, would imply something connected with medicaments or medical practice. Sanitary, from *sansitas*, health, obviously is applicable, and alone is so, to that which concerns the condition of a people or place in respect of what has well been called the greatest of earthly blessings. We observe that the error has even crept into state documents.

CHARITY.

It is an old saying, that 'charity begins at home;' but this is no reason it should not go abroad. A man should live with the world as a citizen of the world; he may have a preference for the particular quarter or square, or even alley in which he lives, but he should have a generous feeling for the whole.—*Cumberland.*

CHAMBERS' EDINBURGH JOURNAL

PRICE 1½d.

RAILWAY LITERATURE.

AMONGST the very great alterations in our social system which railway extension over the breadth and length of Great Britain has produced, the effect it has had upon literature should not be overlooked. Railways have created a new class of publications exclusively devoted to their interests. They have called into existence not merely a new branch of literature, but a whole literature of their own, with each department definitely marked and industriously filled. They have their useful, serious, business books and periodicals for the public to consult, as it does the Ready-Reckoner or the Times newspaper. They have also their light and graceful belles lettres, which the fashionable world is beginning to prefer to commonplace poetry and blasé fiction. A glance at this new and comprehensive literature will assuredly be instructive of the ever-advancing progress of this country.

In the useful department, pre-eminence must be given to a neat waistcoat-pocket compendium, which is as portable as the tiniest Ready-Reckoner, and quite as necessary to the man of business. It may be with truth designated the traveller's best companion, although its real title is 'Bradshaw's Railway Guide.' It consists of a set of tables, interspersed with distinctly engraved maps. The tables tell us the respective distances, the times of starting from and arriving at every railway station in Great Britain; to which is added a list of the fares for each distance. Supposing, therefore, a man to be lounging in the neighbourhood of John o' Groat's a few years hence (when all the railways in this island shall have been complete), and he possess a copy of Mr Bradshaw's miniature time-book, he will only have to make one or two references to it to be able to inform himself of the hour, nay, of the precise minute, at which he would arrive at the Land's End in Cornwall. Even by the aid of the edition now before us, a traveller being in Newcastle-upon-Tyne, may very safely order by post a dinner for the next day at Mr Wynn's excellent hotel in Falmouth at a certain number of minutes before or after any particular hour; and start with the assurance that, though he will have to go over some four hundred and sixty miles—not of ground exactly, but of iron rail—he will be nearly sure of finding himself seated at table just as the Falmouth cook is dishing up the pilchards. He can also, before setting out, calculate from the lists of fares the exact amount of money the excursion will cost him, and know, by consulting the maps, through what counties, towns, and villages he will pass. All this information, and much more about steamboats, coaches, and carriers, is compressed into the smallest possible compass, and bound up in a neat cloth cover.

Next in utility, though perhaps far above Mr Brad-

shaw's little work in point of importance, come several newspapers, which are exclusively devoted to railway affairs. Those already existing are the Railway Journal, the Railway Times, the Railway Record, and the Irish Railway Gazette, published weekly, and the Railway Register, issued monthly. All these periodicals are conducted by scientific men, with a high degree of respectability and independence; the last, a most essential qualification; for their conductors are manifestly more open to temptations of partiality and favouritism than any other class of editors. Hence there resides much influence in these journals for good or for evil. Being looked up to by the public as authorities on the subject to which they are devoted, they have the power either to puff off unstable schemes, which are never intended to be carried further than the share market; or, by dint of cautious inquiry and fearless exposure, to guard capitalists against them. As vehicles for the publication of various transactions connected with old as well as new lines, they put their readers in possession of data upon which to form correct opinions concerning the actual condition and progress not only of particular companies, but of the aggregate of the new but gigantic interest which is now centered in this mode of conveyance. To the honour of all the important companies be it spoken, open unconcealed trading appears to be their rule of conduct, and each publishes a weekly account of the amount of business done during every eight days. Under the head of 'Official railway traffic returns,' there appears in the railway newspapers a table setting forth the money received for the transit of passengers and goods. That every means of calculation and deduction may be afforded to the interested reader, beside this item is placed the amount of receipts of the corresponding weeks in as many previous years as the line has been in operation; also the authorised capital of every company, the amount of its periodical expenses, and the dividend per cent. received by each shareholder at the last division of profits. Thus, by the aid of the railway journals, a person who wishes to invest money may know the exact value of the shares he would purchase on the very day he desires to buy them; and, moreover, be able to form a tolerably correct notion as to whether the property is likely to improve, or to become deteriorated in value. Thanks, therefore, to the exertions of 'railway editors,' there is no species of property which a capitalist can purchase with his eyes so widely open as railway property; for if he wishes to invest his money in houses, he must depend greatly upon the opinion of his builder, or upon the interested report he gets regarding the character and responsibility of the tenants. If, again, he desires land property, he is almost entirely in the hands of his surveyor; but, in buying railway shares, he has only to consult the railway newspapers, and he may judge unerringly for him-

self. To assist him in such cases, the 'Railway Record' attaches to its weekly account 'Notes on the traffic table,' in which is set forth a short statement of the condition (whether finished or not) of the line, or any speciality in the monetary affairs of each company.

There is one peculiarity belonging to these newspapers which, so far as we recollect, no others possess. They are entirely and unmixedly devoted to their one subject, to the exclusion of every other description of matter whatever. The military and naval journals contain short accounts of what is going on in the civil world; the doings of laymen are recorded in the religious papers; and, in short, most of the publications addressed to special classes show some little sympathy with the ordinary affairs of life by some brief chronicle of them. Not so with the papers under consideration. We have one before us, for instance, containing twenty-four pages of close print, and not one single word relative to anything besides railways. So inflexible do the conductors appear in this respect, that they even exclude the flourishing eloquence of puffing advertisers. Out of ten pages of advertisements, not one but has direct or indirect reference to railways. Besides several of the official advertisements of the various companies, they consist of announcements of patent inventions for particular parts of railway machinery, of the names and addresses of share-brokers, and other announcements only relating to railways. The news is equally exclusive. Reports of meetings of companies, letters from aggrieved travellers or disappointed shareholders, information concerning foreign railways, railway police reports, with a leading article, and an essay or two on locomotive topics, form the sum of contents in a railway newspaper.

From the researches we have made from time to time in these very exclusive vehicles of railway information, we may conscientiously say that—considering the temptations we have before hinted at which lie in their way to diverge from the straight line of honesty and truth—a better conducted class of newspapers does not exist. Some, of course, are better than others; but it would be as invidious as unnecessary here to make distinctions.

A few of the temptations to which railway editors are exposed, may be mentioned in the second section of our little treatise on the useful department of railway literature. The readers of general newspapers may have observed that almost every one of these organs, whether provincial or metropolitan, devotes a column or so to 'Railway Intelligence,' in which all the several haps that the railway is heir to are duly chronicled. Where, in the case of a provincial paper, a line is projected or in progress through the district in which it is published, that of course forms the subject for the exercise of the editor's pen—the pivot on which to turn the graces of rhetoric in his leaders. When rival lines are proposed, rival newspapers naturally take a stand in their favour, and a fierce pen and ink war ensues; which introduces us to the controversial department of railway literature. Without hinting a breath of disrespect against provincial editors as a body, we may now produce our instances of the temptations to tergiversation to which they are exposed. We learn from one of the parliamentary reports, that in a certain district a warfare between two rival companies ran so high, and was so energetically supported, that the older of the projecting companies thought it expedient to 'buy off' the opposition of their vigorous opponent, and he was soon able to present an exception to a very general rule; namely, that of a literary man retiring upon a fortune! In his case railway literature had proved a golden egg, though he managed to hatch it under very discreditable circumstances. Another even stronger example of the height to which literary warfare has been carried, is mentioned on good authority. In a midland county, an editor wielded his facts and his logic so manfully, that, in the opinion of the opposed company, he created an effect upon

the minds of his readers far too serious not to damage, perhaps to overthrow, their project. Against bribes—unlike his above-mentioned brother journalist—he was proof. A new paper was started in opposition, but the leaders were weak and ineffective compared with his. Every scheme was tried that ingenuity could invent, or cash execute, to silence him; but the more this was attempted, the stronger he wrote, and the more fiercely he denounced the scheme. At length one of the directors hit upon an expedient worthy of Machiavel. He got himself cautiously introduced to the proprietor of the journal, professed a desire to risk a few thousands in a newspaper property, and by the dazzling offers he made, actually induced the unconscious proprietor, unknown to his editor (who would perhaps have told him better), to sell the property. The moment the bargain was concluded, it was discovered too late that the railway company had, through the wily director, possessed themselves of the copyright of the paper, of the printing-office, and of the services of the editor. He, however, nobly refused to change his railway politics, and was accordingly dismissed, taking with him the respect both of friends and enemies. This case will readily be credited when we state that in one of the reports adverted to, it is stated that the cost of a certain railway in 'buying off' opposition from land proprietors as well as editors, and in law, amounted to £1800 per mile; and that before a single rail was laid, or a spade put into the ground.

Before dismissing the four well-conducted special railway journals, and the regular stand which railway intelligence and controversy has taken in the columns of the press in general, we must not forget that the London Gazette has of late become almost a railway newspaper. By a recent act of parliament, not only notices of every projected line must be set forth, but the decisions of the government railway board concerning their expediency promulgated in that official publication. During the present session of parliament, notices for no fewer than 248 new branches or new lines have been issued, and it is no uncommon thing to see the Gazette nearly filled with them.

But of the vast masses of printing called into existence by railways, there is nothing to equal in quantity the reports of parliamentary committees—those enormous folio 'blue-books,' so dreadful to the visions of busy editors, but so dear to the eyes of enthusiastic statisticians. Whenever a dispute occurs concerning the expediency of having more than one line laid down between the same places, or when certain interested parties deem any railway whatever inexpedient, the controversy is referred to a 'select committee of the House of Commons.' These committees consist of some eight or ten members of parliament, who hear evidence on both sides, and give their decision in 'reports.' It often happens that weeks are employed in merely taking evidence; every word of which is accurately noted in short-hand, afterwards printed, and stitched into the well-known blue covers. Besides this, there is a report of the committee printed separately, as well as addenda, appendices, &c. Now, it happened that, in the course of the last session of parliament, between forty and fifty of these committees sat, heard evidence, reported, and—printed. Consequently, at the very least five-and-forty blue-books were issued, with their equally blue satellites, in the shape of reports, additions, and appendices. Supposing we give to each of these twelve hundred and fifty pages (a moderate average), we may calculate that in one year railway speculation and railway opposition called into existence upwards of sixty thousand folio pages of print! And this is not all. These reports give rise to countless pamphlets, written either in reply to some of the witnesses, or for the advocacy of particular views. As regards the utility or instructiveness of the blue-book branch of railway literature, we can only say that its chief fault is its extreme bulkiness; for much honey is to be extracted from it. Amongst the witnesses are

the most eminent engineers, who furnish valuable information in answer to questions put to them; practical men of business supply lessons of sound wisdom; whilst non-professional witnesses sometimes relieve the tedium of scientific detail by the quaintness or jocularity of their replies.

From the statistical, periodical, and controversial writings which the all-powerful locomotive has created, we now turn to its historical literature. Upon this subject much has been written, and a short summary of what has already appeared we now propose to give. Railways being still in their infancy, of course their history is short.

The mere notion of lessening the draught of wheeled carriages by running them on the smooth surface of wooden or iron rails, is by no means new; such rails, in the form of grooves or ruts, for the reception of the edges of wheels, and called *trams*, were in use quite two centuries ago in the English collieries. Roger North, in describing the 'way-leaves' granted for the privilege of laying down such roads, and of transit over them at Newcastle, says, 'When men have pieces of ground between the colliery and the river, they sell leave to lead coals over their ground, and so dear, that the owner of a rood of ground will expect £20 per annum for this leave. The manner of the carriage is by laying rails of timber from the colliery down to the river exactly straight and parallel, and bulky carts are made with four rowlets fitting these rails, whereby the carriage is so easy, that one horse will draw down four or five chaldrons of coals, and is an immense benefit to the coal-merchants.'

This practice was somewhat older than 1676, when the above passage was written. By the middle, however, of the last century, the iron works of Shropshire and Staffordshire had become sufficiently extensive to enable the Northumberland coal proprietors to substitute iron for wooden trams, and to attract the system southward. In 1760, iron plates were first laid down upon wooden rails in Colebrook Dale, Shropshire, and were speedily adopted in all the English and Welsh mines and collieries; so that by 1811 there were, in South Wales alone, above 150 miles of this description of railway. Still, the power of steam remained unapplied till the year 1813, when Mr George Stephenson constructed the first locomotive engine. Mere theorists thought him crazed; for it was never supposed that the smooth wheels of a steam-carriage would adhere sufficiently to the equally smooth rails, so as to produce locomotion. It was thought that the wheels would run, or rather slip, round without moving the carriage; that, in short, 'they would not bite.' But George Stephenson determined to try by actual experiment. 'The first locomotive which I made,' said that gentleman, at a dinner given to him late last year in Newcastle, 'was at Killingworth colliery, and with Lord Ravensworth's money. Yes! Lord Ravensworth and Co. were the first parties that would intrust me with money to make a locomotive engine. That engine was made 32 years ago, and we called it "My Lord." I said to my friends that there was no limit to the speed of such an engine, provided the works could be made to stand.' A partial failure on the Stockton and Darlington line—on which Stephenson's locomotive was tried, and which was opened in 1825, for conveying passengers by means of horse-draught—led to a temporary prejudice against his sanguine views as to amount of speed. One writer, who professed himself a friend of locomotive engines, delivered himself as follows:—'It is far from my wish to promulgate to the world that the ridiculous expectations, or rather professions, of the enthusiastic speculatist may be realised, and that we shall see engines travelling at the rate of twelve, sixteen, eighteen, twenty miles an hour. Nothing could do more harm towards their general adoption and improvement than the promulgation of such nonsense.'

Still Stephenson, who knew well what he was about, persisted in asserting the above 'nonsense,' but it was so little heeded even by experienced men, that when, in 1828, the promoters of the Liverpool and Manchester railway employed him, and he was summoned as a witness before a committee of the House of Commons, they intreated him not to shock the common sense of the members by stating his expectations of higher speed than ten miles an hour. 'When,' said Mr Stephenson, in the above-quoted speech, 'I went to Liverpool to plan a line to Manchester, I pledged myself to attain a speed of ten miles an hour. I said I had no doubt the locomotive might be made to go much faster, but we had better be moderate at the beginning. The directors said I was quite right; for if, when they went to parliament, I talked of going at a greater rate than ten miles an hour, I would put a cross on the concern. It was not an easy task for me to keep the engine down to ten miles an hour; but it must be done, and I did my best. I had to place myself in that most unpleasant of all positions—the witness-box of a parliamentary committee. I was not long in it, I assure you, before I began to wish for a hole to creep out at. I could not find words to satisfy either the committee or myself. Some one inquired if I were a foreigner, and another hinted that I was mad. But I put up with every rebuff, and went on with my plans, determined not to be put down. Assistance gradually increased—improvements were made every day—and to-day a train, which started from London in the morning, has brought me in the afternoon to my native soil, and enabled me to take my place in this room, and see around me many faces which I have great pleasure in looking upon.' Thanks to the indomitable perseverance of Stephenson in persisting in his 'nonsense,' there are at present nearly a hundred lines in Great Britain in full operation, on not one of which is the average rate of speed less than twenty miles per hour. So much for the 'ridiculous expectations of enthusiastic speculatists.' From this scrap of railway history, we turn to a consideration of its light literature.

We cannot conscientiously recommend so strongly as the railway newspapers, certain other periodicals professing to be devoted to the lighter matters which float about railways, because they seem in a great measure to hoist false colours. On looking into them, we cannot perceive that they are anything more than repertoires of general facts and stray witticisms, illustrated with wood engravings. We must therefore dismiss them at once, to consider the effects which railways are gradually spreading over the current literature of the day.

Composed as a railway train is of mechanical details, and connected as it is with utilitarian maxims and doings, it possesses, we believe, some of the elements of poetry. Sink details—remove it to a distance where we only witness its force and speed, and, even as a sight, it becomes sublime. Regard it further as a recent product of man's restless ingenuity—a surprising application of physical principles to the convenience of our race, and the sublimity becomes moral. Here there surely is poetry. *Against* railways, indeed, the voice of a distinguished English poet has lately been raised. But his effusion was promptly answered by other sonnetteers, who adopted the views we are now advocating. And why should it not be? The ship, with all its attributes and accessories, has for ages furnished similes for poets: who can say that, when Time has sufficiently hallowed such objects, steamers and locomotives will not be equally prolific in tropes? To the novelist, a railway train is invaluable; for where can he bring his characters so unexpectedly, yet so probably together as in a double-seated carriage? His elopements may be managed with far more celerity—hence with far more excitement—by rail than by the slow-going post-chaises of the old north road; and then for a catastrophe, what would satisfy poetical justice and a melo-dramatic author so abundantly, as to crush up all his bad characters by a railway collision? We perceive that one writer

* Life of Lord Keeper Guilford, vol. I. p. 365.

has taken to the rail for his plots in right earnest. In recent numbers of the Dublin University Magazine appears a series entitled 'Tales of the Trains, being some chapters of Railroad Romance.

We take leave of the subject by mentioning one very gratifying fact which is intimately connected with it. Some of the liberal minded amongst the railway directories have provided for their engineers, stokers, and other employées, small and compact libraries for their amusement or instruction during the many intervals of leisure which necessarily occur. These collections of books, enclosed in a case so as to be easily removed from one station to another, form libraries always at the command of the companies' servants at the hours they most need them. Some time ago we had the pleasure of selecting such a collection at the request of the authorities of a railway near Edinburgh.

THE ENGLISH PEASANTRY IN THE MIDDLE AGES.

THE rural population forms a very large proportion of the inhabitants of the British islands: on them we are dependent for much of our domestic comfort and national prosperity; for all those agricultural ameliorations which have changed the barren heath into a fertile field, and converted the unwholesome swamp into the verdant meadow; and yet how few have ever troubled themselves to inquire into the origin and history of the tillers of the soil. A little information on this subject may be of service to those well-intentioned individuals who take pleasure in improving the condition of their dependents. The past is a mighty teacher, and the great lessons it sets before us are not to be lightly regarded.

We learn that the progress of the class whose history we are about to consider has ever been, though slow and often checked, upwards, onwards. Starting from the lowest point to which humanity can descend, they have bravely, and to a great degree successfully, contended against the disheartening impediments thrown in their way—a result which certainly entitles them to our respect, and one that should lead us to look upon their lack of education, and rudeness of manners, with a little more charity than is our wont.

Those who have journeyed much over the pleasant roads of England, who have stepped aside from the highway to the green and leafy lanes, cannot fail to have remarked the peculiarities of appearance, manners, and speech, which the peasantry of that country exhibit; characteristics that vary with every change of county, showing most of them marked traces of the original extraction of the race who have gone on ploughing and sowing from the days of the Heptarchy to the present time, little thought of in the strife of interests, the exactions, privations, and sufferings, which so materially affected their own position, and retarded their advance towards those changes which, releasing them from bondage to the soil, has left them in the circumstances presented by our own day.

We shall avail ourselves of the publication of an interesting paper in the thirtieth volume of the *Archæologia*, to throw light on the physical history of this little-heeded race, which it appears sprang originally from a class of *slaves*, and is quite distinct from the pure Anglo-Saxon stock. For the source of this state of things, we must go back to the days when the Teutonic tribes existed in all their warlike ferocity over the whole of Germany: when flocks and herds were held in more esteem than tillage; and when attachment to chiefs, and councils held in the open air, were the chief characteristics of their nomadic

or wandering life. Society was then divided into two great classes—the masters and the slaves; the latter most probably having been brought into that condition by conquest, while their numbers were maintained undiminished by captives taken in predatory expeditions, or by others sold or condemned to slavery. A similar state of things exists in Russia even in the present day; there the serfs, or lowest portion of the agricultural population, occupy the same place as did the slaves of the Germanic nations.

The first code of laws affecting the condition of the Anglo-Saxon serf was made under the influence of St Augustine in the sixth century: our knowledge of the previous ages is very uncertain. When the Angles and Saxons first came to settle in this island, which happened soon after the departure of the Romans (the fifth century), we are told by old chroniclers that they came in such great numbers as to depopulate their own countries: they must consequently have brought with them a numerous servile class of settlers, who would be employed in cultivating their new possessions, already occupied by the people subjugated and abandoned by Rome. From this intermixture may be traced the peculiar characteristics of the rural population. The earlier kingdoms of the Anglo-Saxons were Kent, under the dominion of Ethelbert, the patron of St Augustine; Essex; Wessex, under King Ina, which would naturally contain the greater part of the foreign race of agriculturists; while in Mercia, the remoter parts of Northumberland, governed by Edwin, and the western districts of the island, the majority must have consisted of the older British population.

The common name of the serf under the Anglo-Saxons was *theow*, a bondman. The term for a female was *wylor*. Of these the unmarried portion had no recognised protection from the outrages of their lords. Marriages could not take place between those residing on two different estates, as such a connexion would involve division of families, and lead to disputes between the proprietors. Marriages of *theows* were looked upon as legitimate; but if one party obtained freedom without being able to free the other, the marriage was no longer binding, and the liberated slave was at liberty to choose another partner. The master had the power of life and death over the *theows*, for whom there was no appeal: and although they were not prevented from acquiring property, it was never safe in their possession; and it appears that the only punishment ever thought of for those who defrauded them of their gains, was that of penance under the ecclesiastical law, of which we find different degrees enjoined against those who stole from the *theows* the money they had lawfully earned; or those who slay them without judgment or cause; or a lady who beats her *wylor*, so that she die within three days; or a free man who, by order of his lord, killed a *theow*. According to the laws of King Ina of Wessex, if a *theow* worked on the Sunday by his lord's command, the lord lost all right over him, and he became free; but if he worked without his master's consent, he was to 'suffer in his hide,' or be flogged.

During the whole of the Anglo-Saxon period, the number of the *theows* was continually changing by manumission and the condemnation of free men to slavery—a punishment equivalent to that of a modern sentence to the hulks or galleys. If a freeman worked on the Sunday by his own choice, he incurred the penalty of servitude, or a fine of sixty shillings. If he struck one of the royal foresters on duty, or killed one of the king's

deer, he was equally deprived of freedom. 'If he stole himself, or ran away, he was to be hanged. In times of distress many persons voluntarily sold themselves to *theowdom*, with the object of securing protection and a livelihood. A father might sell his own children before they reached their seventh year; after that age he could not do so without the child's consent. It does not appear that the theows paid any direct tax to the king, though a toll was exacted for their sale. We learn from a passage in the *Coloquium of Alfric*, published early in the eleventh century, a few particulars as to the nature of the service they rendered to their lords. A ploughman is examined concerning his occupations:—"What sayest thou, ploughman; how dost thou perform thy work?" The answer is, "My lord, I labour excessively. I go out at dawn of day, driving my oxen to the field, and yoke them to the plough. There is no weather so severe that I dare rest at home, for fear of my lord; but having yoked my oxen, and fastened the share and coulter to the plough, every day I must plough a whole field (acre?) or more." The teacher continues, "Hast thou any companion?" "I have a boy who urges the oxen with a goad, and who is now hoarse with cold and shouting." "What more dost thou in the day?" "Truly, still I do more: I must fill the mangers of the oxen with hay, and water them, and carry out their dung." "Oh! oh! it is great tribulation." "Yea, it is great tribulation, *because I am not free.*"* The concluding words of this examination contain the key to that sullen spirit of opposition too often encountered among the humbler classes of society in all ages of the world, while the remark of the teacher shows that the serfs were kindly and compassionately regarded by the Anglo-Saxon clergy, who encouraged the practice of gratuitous manumission as an action highly meritorious in the eyes of the church. We are informed that Athelstan Manneassone set free thirteen men in every thirty, choosing them by lot, through all his lands, for the salvation of his soul; 'that being placed in the open road, they were at liberty to go whither they would.' It sometimes happened that a man who had no theows of his own, bought one, in order to emancipate him, an instance of which is recorded in the case of Alfric, canon of Exeter, 'who redeemed Reinold of Heberdii and his children and all their offspring for two shillings, and Alfric proclaimed him free and sac-less in town and out of town, for the love of God.' The theows sometimes saved sufficient money to purchase their own freedom and that of their families. At Exeter, Huscari liberated himself for forty pennies. Leofwine, son of Feala, bought 'himself and his offspring, to be at liberty to choose themselves masters where they would,' for half a pound.

This was the condition of the great mass of the population during the long period embracing the Saxon and Danish lines of rulers; but when the Normans, under William the Conqueror, invaded and subjugated the country, they viewed their dependents in a less favourable light than their Anglo-Saxon masters had done. The cruelties and exactions of the new oppressors, in their own country, had goaded the peasantry into frequent insurrections; in which the latter were defeated by their lords with the most contemptuous and horrible cruelties. In England, they enforced the laws which strengthened their own power with the greatest seve-

rity, while they disregarded or rejected those which favoured the suffering theows. They even degraded the free and wealthy occupiers to a level with the poorest, diminishing at the same time the security of personal property. They also introduced the Norman term, *villani*, for the theows. We have several striking pictures of the condition to which the peasants were reduced under the feudal barons. They were loaded with taxes; and when fines were levied by the king on their masters, these were always wrung from the poor villans, who complained that 'their lords do nothing but persecute them. They cannot have their goods safe, nor their earnings, nor the fruits of their labour. They pass their days in tribulation, with great pain and labour. Every year is worse than that which preceded. Every day their beasts are taken from them for aid and services; there are so many claims brought against them, and taxes old and new. There are so many reeves, and beadles, and bailiffs, that they cannot have one hour's peace; they can have no security either against the lord or against his sergeant, who keep no covenant with them, and some even apply to them opprobrious epithets.' Most of the services required of the villans were galling and degrading in the extreme. They could not marry without paying a tax to their lord. In fact, they were looked on as no better than cattle: a contempt which at times cost their masters dear; for to the brutality of the tax-gatherers of Richard II. to the daughters of the peasantry, we may look as among the immediate causes of the insurrection under Wat Tyler.

We may gain a pretty accurate idea of the condition of the oppressed serf from one of the metrical romances or ballads which were so popular during the thirteenth century. 'There was a poor villan who had a wife and children, whom he supported by cutting wood in an adjoining forest. One day, whilst thus employed, and bemoaning his miserable condition, he heard a voice which issued from the root of a tree, and which offered to raise him from his poverty if he would promise to be pious and charitable when he became rich. The spirit then told him that his name was Merlin; that when he returned home, if he dug in a certain spot in his garden he would find a great treasure; and that at the end of a year he might return to the tree and intimate his further wishes. At the end of the year the villan returned, and humbly and respectfully made known his desire to become provost of the town. This wish was immediately granted: but the villan, elected provost, became cruel and oppressive to all his inferiors. At the end of another year the villan returned again to the wood, and addressed the spirit familiarly, and with somewhat less respect than before. "What is your will now?" said Merlin. "I desire that my son, *who is a clerk*, may become a bishop." Within a few weeks a bishopric fell vacant, and the villan's son was elected. At the end of a third year the villan, still less respectfully, required that his daughter might be married to "the grand provost of Aquileia," which also soon afterwards came to pass. The villan had now arrived at the summit of his wishes; and, at the end of the fourth year, it was only at the request of his wife that he would condescend to return to the wood, and rudely say farewell to his benefactor. The spirit reproached him with his ingratitude, and threatened him with punishment. Within a short time his daughter (the grand provost's wife) and his son, the bishop, died; and, which was still worse, "*his lord*," soon after engaging in war with a powerful neighbour, was in want of money to carry on his hostilities, and demanded of the rich villan a thousand pounds; the villan pleaded that he could not raise the money, and refused to pay it, and then the lord, in revenge, seized all his property, and left him only enough to buy an axe, to enable him to resume his old trade of a woodcutter.

This tale not only conveys a beautiful moral, but proves that the sons of the serfs were not debarred from learning. In the example above, we see mention is made

* It is remarkable how correctly this description applies to the labours of a Scottish (perhaps also English) ploughman of the present day. In our country, it is his practice everywhere to commence work at daybreak all the year over, and to go on through the day performing exactly the duties above described; the severity of which, it is strongly to be suspected, tells heavily upon the constitutions of these men, scantily provided as they are with the main necessities of life: hence our farm-labourers—a quiet and generally well-behaved class—become for the most part prematurely old about five-and-forty.—Ed.

of the *clerc* rising to a bishopric. At the same time it is evident that, with the acquisition of riches and honours, the villan had not ceased to be a slave. His case furnishes an illustration of the impunity with which the class were frequently plundered by their lords, who were strangers to them both in blood and language. The villans were virtually outlaws; they could not legally inherit lordship, bring any action, or give testimony in a court of law. A poet of that day disdains the idea of teaching villans and making them priests. 'I see,' he says, 'many places dishonoured by them; there are plenty of gentlemen; and he did a great sin who ever introduced a villan among them.' The poets and minstrels of the age, by their songs, increased the contempt of their lords for the peasantry: they delighted in drawing pictures of the hatred with which the villan regarded all of gentle birth: 'the doggish villan is he who sits before his door on Sundays and holidays, and mocks all who pass; and if he see pass a gentleman with a hawk on his fist, he will cry out, "Ha! that kite there will eat to-night a hen, which would be sufficient to fill all my children."' Some of the writers inquire, 'Why should villans eat beef or any dainty food? They ought to eat, for their Sunday diet, nettles, reeds, briars, and straw; while pea-shells are good enough for their every-day food. They ought to go forth naked on four feet in the meadows, to eat grass with the horned oxen.' A villan was declared to be incapable of telling the truth, or of feeling gratitude. Another writer says, 'God, who has sent the multitude of rustics for the service of clerks and knights, and who has sowed discord between us and them; grant us, we beseech thee, to live upon their labours, and to rejoice in their mortification.'

But the English minstrels, they who wandered among the populace, told a different story. Their songs abound with stirring recitals of the wrongs, of the injustice and oppression endured by the peasantry, who at length were driven to appeal to the king. The time had come when the slaves were to be heard; and the decline of the feudal system accelerated the movements which broke out vigorously in the fourteenth century.

It appears that at an early period there were villans possessed of sufficient courage to speak in court in defence of their fellows. This generosity was, however, turned into ridicule; they were called 'prince villans, who go to plead before the bailiff for the gain of one hundred sols.' Many persons, also, skilled in the laws, aided the villans in their pleadings against their oppressors; these were paid by subscriptions raised among the serfs themselves; and it appears that at this period they met in great numbers, and swore to stand by each other in defence of their rights.

In the reign of Henry II., a law was passed to forbid the seizure of the property of the villans in payment of the debts of their lords; and boroughs were then first incorporated, from which the freemen derived great privileges and protection from the power of the barons. The next reign saw the great charter wrung from the tyrannical John: one article related to the villans—when fines were inflicted on them, they were to be permitted to retain their tools; a proof of the wretchedness of their condition, when this was regarded as a measure of justice. It is, however, from the time of the third Henry that the commons date their importance, being then first admitted to parliament, and privileges granted to them which were afterwards confirmed. Great truths began to be perceptible; the preaching of Wickliffe awakened the minds of the peasantry; a new light broke upon them; the democratic precepts of the Bible pleased them: it was said that at the 'beginning of the world there were no slaves,' and the villans, finding their appeal to the laws productive of little or no benefit, resolved on striking a great blow for their freedom. They assembled to the number of 100,000, and marched, 'with arms in their hands, to lay their grievances before the king. They hastened towards London from the eastern and south-eastern counties, where the reforming

spirit was generally strongest, on account of their frequent communication with the agitators on the continent. On the way, they would not let slip the opportunity of trying if "villans' blows were as hard as lords' blows;" and a few acts of violence showed that they were but too willing "to destroy all gentility." Their leaders, indeed, preached to them that in the days of Adam there were no gentlemen. They obtained for a moment possession of London; and if their leaders had been steady and skilful, it is impossible to say what might have been the result. They had come together with a variety of complaints, which, however, at last merged into one great grievance; and when the king had consented to give general charters of enfranchisement, they returned willingly to their homes. But when they had laid down their arms, the charters of enfranchisement were withdrawn, and the villans were not only reduced to their old condition again, but hundreds of executions evinced the vengeance and hatred of their masters. Another age of slavery followed before the wretched peasantry were allowed to be considered in the light of men. The change was gradual, and has left fewer traces in history than might have been expected. The shadow of the old state of things is still preserved in many of our old manorial customs; and the memory of the old feeling of the lords towards their dependents has been perpetuated in the signification now attached to the word villan.'

We will now take a long step in advance, and look at the condition of the labourers at a later period—the reign of Edward VI. In the interval, the great increase and spread of commerce and manufactures, and the suppression of monastic institutions, had entirely changed the social relations. The peasantry no longer formed part of the value of the estate on which they had been born; they could go where they pleased, and, consequently, were no longer fed or cared for by the lords: they endured many privations, which were in a great measure relieved by the benevolence of the church; their daily necessities had been relieved at the gates of the monasteries throughout the land. But the despoiling of these establishments in the preceding reign had cut off the source of ecclesiastical charity, and thrown a great burden of indigence and misery upon the community at large: it was then found necessary to devise measures of relief, and at the same time to provide employment and stimulate industry. A statute for the *punishment of idleness* was the consequence: severity was regarded as the first remedy. *Sloth*, when detected, subjected the offender to *two years of slavery* either to his parish, or to those who captured him. The law further recommended that the individuals thus captured should be punished by the severest of labour, with scanty food; from which, if the poor wretch attempted to escape, he became the property of his master *for life*, and was stamped on the breast with a red-hot iron with the letter S for *slave*. A second attempt to run away was punished by hanging. Idle children were legally recognised as the slaves of any one who would be at the trouble of catching them—boys until the age of twenty-four, and girls to twenty-one—and might be confined with rings or chains at the discretion of their captors. It is easy to imagine what must have been the intolerable abuses of such a law. It was repealed before the end of the reign, and two collectors were appointed in every parish to receive money, the payment of which, for the relief of the starving peasantry, was enforced by a law, which continued in operation down to the time of Elizabeth, when the price of labour was fixed, and those who had no ostensible occupation were compelled to resort to agricultural labour, or other specified employments. The period of notice on quitting service, as well as the regulations for the apprenticeship of children, was also fixed. Houses of correction were established, and overseers appointed. All of these measures were finally embodied in the act maintained, with little alteration, until the late change from which the 'unions' date their origin.

We have thus given a slight outline, extending over a long period of history, and embracing many phases in the progress of a race who require, above all, a spur to independent and honourable exertion—the constant support of an elevating motive.

TRAVELS BY A SCOTTISH CLERGYMAN.

THE REV. WILLIAM ROBERTSON,* minister of the New Grayfriars Church, Edinburgh, was in 1841 commissioned by the Colonial Committee of the General Assembly to proceed to Gibraltar, for the purpose of arranging the appointment of a Presbyterian chaplain for the troops. Besides executing his mission, he visited, in going, Vigo, Lisbon, and Cadiz; and while at Gibraltar, made excursions to such places of note as were within the reach of the time and means at his command: amongst these were Seville, Malaga, and Granada. He also crossed the Strait of Gibraltar, and visited Tangier, which recent events have brought into much notice. Since his return, he has presented his observations in a volume marked by much more sprightliness than was to have been expected from his profession or his mission. We propose glancing over this work, and showing a few specimens of the metal it is made of.

TANGIER.

The town of Tangier, built at the eastern mouth of the Gibraltar Straits, is surrounded by a Gothic wall, flanked at short distances with small towers. A fosse not more than three or four feet deep surrounds the base of the wall in its entire extent, which is about two thousand and a half yards. This ditch is either in ruins or planted with vegetables. In front of the port, and at its entrance, many batteries arise, of two storeys, armed in all with about sixty pieces of ordnance. Tangier being the residence of the foreign consuls, and of a large number of Christians as well as Jews, is called by strict Mussulmen the town of infidels. The number of inhabitants has been variously estimated at from six to twelve thousand.

Under the guidance of an intelligent and well-dressed cicerone, Mr Robertson, and two gentlemen who accompanied him from Gibraltar, surveyed the town. 'Town,' he continues, 'I presume it must be called; but so unlike is it to anything that bears that name in Europe, that were it not for the houses of the consuls, it bears about as much resemblance to a town as a city of ant-hills. The houses are so small, that one might believe them to be inhabited by a race of pigmies, were it not for the tall, brawny, muscular fellows who are seen going in and out. The houses never exceed two storeys in height, and these very low. The entrance is low and narrow. Each house has an open court like the Spanish patio in the middle, in which there is invariably to be found a fig, vine, or olive tree; so that in this happy land every man reposes "under his own vine, and under his own fig-tree." These interior courts or quadrangles are, like the apartments of the house, of very small dimensions; but they serve to keep the rooms cool and airy, as they all enter from them. The roofs are perfectly flat, and covered with *terras*, a composition of lime and small stones beaten smooth with wooden mallets. In the better class of houses, there are pipes which conduct the rain-water from the roof to cisterns under ground. But in general there is no such provision; and the cement being quite insufficient to exclude the wet, in the rainy season the rain penetrates both roof and walls, and keeps the whole house in a miserable state. All the apartments are on the veriest pigmy scale. If the Moor has room to squat, he wants no more. The furniture is common and simple; and almost the only ornament in their rooms is a rich and beautiful piece of

Morocco needlework, wrought on coarse muslin, of various patterns and the most brilliant colours, occasionally hung as drapery round a small looking-glass on the wall, or in front of the bed. The streets are rarely wider than is absolutely necessary to allow two donkeys to pass each other; and if both are laden, they may sometimes find the passage narrow enough. They are littered with all kinds of refuse. Very few of the houses have any windows to the street; so that one appears to be walking in narrow lanes betwixt two dead walls, in place of in the streets of a populous town.'

Of the castle of Tangier, which lately received such rough treatment from the guns of the French, our traveller says, 'It stands on an eminence overhanging the town, and commands a magnificent view over the town and bay. The hill on which it stands had once been extensively fortified, but the works are now entirely dismantled, and almost in ruins. The castle itself externally appears almost as ruinous as the fortification, but is nevertheless still used as the residence of the governor when at Tangier. On entering, we were astonished to find the apartments in such good repair, belying their outward promise. One is astounded, after scrambling over broken walls, and through heaps of lime and rubbish, to be conducted into elegant and tasteful apartments, adorned with all the beautiful and fantastic ornaments peculiar to Moorish architecture. In the centre of the building there is, as usual, a large open quadrangle, surrounded by an elegant colonnade of white marble. The pillars are of the slender and graceful proportions so much admired in Moorish buildings, and their capitals fantastic and varied, but all bearing a resemblance to the Corinthian. The apartments on both storeys are small, but a great portion of their gaudy and glittering, but most tasteful decorations, is entire. The vaulted roofs, richly ornamented and embossed, and painted in various brilliant colours, are in perfect preservation. Much of the ancient party-coloured glazed tiling also remains, and the delicate tracery of the lacework on the walls is uninjured, except by whitewash. In fact, the castle of Tangier, in the style of its decorations, is the counterpart of the Alcazar of Seville; perhaps more perfect in respect of the ornamental part, but possessing no such elegantly proportioned apartments, and especially nothing at all comparable to the noble Hall of the Ambassadors. At present, it looks desolate and empty. There is not a single stick of furniture in any of the rooms; and the governor, when he visits Tangier, brings his furniture along with him.'

Of the personal exterior of the Moors, Mr Robertson gives a glowing description. 'The Moor, especially when somewhat advanced in life, is a magnificent lion-like creature. He is rather above the middle size, stout-built, large of limb, with great display of muscle; noble features approaching to the Roman, an ample brow, a dark eye, and (in jockey phraseology) uncommonly fine action; lifts high, steps out well, and sets down his foot with a firmness of tread peculiar to himself. With turbaned head, his loins girt with a red saah, wide white trousers, and naked limbs, as he moves along with his free, unfettered stride, he presents a remarkable contrast to the close-buttoned European, with his artificial manner and confined garb—

"That sewed-up race—that buttoned nation,
Who, while they boast their laws so free,
Leave not one limb at liberty;
But live, with all their lordly speeches,
The slaves of buttons and tight breeches."

The striking peculiarity of the Moor is his lion-like appearance. Often have I stood and gazed with admiration on a group of these swarthy turbaned children of the sun, squatted cross-legged, pipe in mouth, solemn and silent, under shelter of the parapet wall of the king's bastion, and wondered at the singular resemblance which their grave countenance, strongly-marked features, and air of savage dignity, gave them to the lord of the desert in repose. Place them under a palm tree beside the

* Journal of a Clergyman During a Visit to the Peninsula in the Summer and Autumn of 1841. Edinburgh: Blackwood and Sons.

Diamond of the Desert, and Rubens would glory in the picture.'

Having gratified his curiosity at Tangier, Mr Robertson returned to Gibraltar. His next excursion was to

GRANADA.

The most remarkable object in this ruined capital of ancient Moorish power and splendour is the Alhambra. 'The external appearance of this renowned palace is as remarkable for meanness and deformity as its internal structure is for richness and grace. It is precisely what Swinburne describes—"a heap of as ugly buildings as can well be seen, all huddled together, seemingly without the least intention of forming one habitation out of them." The roof is covered with deeply-channelled tile. The walls are built in a slovenly manner, and coarsely plastered. There is not the slightest attempt at external ornament—no symptom of regularity of design; so that the whole mass looks like a confused heap of coarsely-finished barns or granaries. I know not whether the external ugliness of Moorish palaces is the result of design, and in order to increase the effect by contrast of the taste, beauty, richness, and symmetry within. Certainly the effect thus produced is absolutely startling, and the surprise one experiences on entering literally bewildering. The suddenness of the change appears like enchantment. By an obscure and rudely-finished door, and through a dead wall, the construction of which would discredit a farm-yard, we are ushered into a palace which might rival the most brilliant descriptions of eastern romance. I shall not attempt to describe this singular edifice. No description, indeed, can convey the slightest idea of the building, either in the arrangement of its apartments or in its decorations. They are altogether unlike anything with which the eye is familiarised in European architecture; and the very names by which we should be forced to distinguish the different compartments, would necessarily convey a false impression of their appearance. To describe the ornaments and decorations of this fairy palace would especially be a hopeless task. The exquisite symmetry of the various courts and halls, the singular lightness and elegance of the slender marble pillars, with their fanciful capitals and richly ornamented arches, the gorgeous colouring on roof and cupola, the tasteful minuteness of the stucco lacework on walls and ceilings, the pleasing variety of mosaic patterns, the singular airy loveliness and most graceful richness of the whole, are things of which neither pen nor pencil can convey any correct idea. The fresh loveliness of the brilliant decorations of the Alhambra seems to mock the faded glories of its ancient lords. The perfect symmetry of the apartments, and the exquisite harmony of their decorations, detract much from their apparent size. But though actually of larger dimensions than they appear, they are by no means of great size. Beauty, and not grandeur, is the object aimed at by the Moorish architect; and the dimensions of the various apartments are admirably proportioned to the peculiar style of decoration. The light and elegant pillars, with their endless variety of capital; the finical yet most graceful minuteness of the fretwork which adorns the walls; the beautiful, rich, but fanciful ornaments of the arches and ceilings; the carving and inlaying, and brilliant vermillion and azure colouring of the alcoves—would, in apartments of great size, be regarded as frippery and gingerbread. Here they are in perfect harmony, and accord so exquisitely with the style, dimensions, and proportions of each apartment, as to produce a whole of unrivalled grace and beauty. The Court of the Myrtles, by which we enter the palace, is the plainest, and has suffered much in its ornaments; but were it not for its proximity to the celebrated Court of the Lions, would be exceedingly admired. This last is a most exquisite specimen of that peculiarity in Moorish architecture—the open court—from which, doubtless, the Spaniards have derived their patio. The elegant and oft-described Foun-

tain of the Lions still shoots up its crystal jet in the centre of this splendid court. It consists of a double marble basin, one rising on a pedestal from the centre of the other; and from the centre of this upper basin the water is projected through a marble tube or pillar. The jet falls into the upper basin, from whence the water overflows into the lower, and is discharged from the mouths of the twelve lions which support it. The lions are grotesque, misshapen, ugly brutes. The basins are of very elegant shape and workmanship, ornamented with sculptured festoons and Arabic inscriptions. It is said to have been constructed professedly in imitation of Solomon's molten sea; to the description of which, in 1st Kings, it bears no small resemblance. "It stood upon twelve oxen, three looking toward the north, and three looking toward the west, and three looking toward the south, and three looking toward the east; and the sea was set above them, and all their hinder parts were inward. And it was an hand-breadth thick, and the brim thereof was wrought like the brim of a cup, with flowers of lilies." The oxen of the molten sea supported the basin in the same manner as the lions in the fountain of the Alhambra. The Court of the Lions probably presents the most finished specimen of architectural beauty and elegance in the world. According to Swinburne's measurement, it is one hundred feet in length and fifty in breadth. It is surrounded by an open corridor of indescribable lightness and elegance, the roof of which rests on richly-ornamented arches, supported by one hundred and sixty-four slender marble columns, curiously sculptured, and with such a variety of capitals, that no two appear to be alike. The ceiling of the corridors is of carved wood, originally gorgeously painted in azure, vermillion, and gold, and inlaid with ivory; but only enough remains of these rich decorations to prove their ancient magnificence. Three noble and gorgeously-ornamented halls open from this corridor, namely, the Sala de los Abencerrages, or "Hall of the Abencerrages," on the south; the Sala de las Dos Hermanas, or "Hall of the Two Sisters," on the north; and the Sala de Justicia, or "Hall of Justice," on the east.

Besides mere descriptions of interesting localities, Mr Robertson's pages are interspersed with anecdotes and remarks strongly illustrative of the various people amongst whom he travelled. We select the following:—

PATRIOTIC SEAMEN.

'Captain Marryatt takes notice of the fact, that the American navy is in great part manned by British sailors, and speculates on what line of conduct they might adopt in case of a war betwixt the two countries. An interesting circumstance in point occurred lately in the Bay of Gibraltar. It was at the time when great apprehensions of hostilities were entertained, owing to M'Leod's imprisonment. Two men-of-war, of nearly equal force, one British and one American, were lying opposite each other in the bay, and no one could tell but that the next post might bring tidings which should convert them into mortal enemies. In this state of matters, a considerable number of the crew of the American being British born, held a consultation together, and agreed to send a deputation to the quarterdeck to inform their captain that, in the event of a rupture betwixt the two countries, he must not depend on them, for that they would not fight against their countrymen. This is an honourable trait in the character of poor Jack, which ought not to be forgotten.'

A ROBBER EXPLOIT.

'A few weeks ago a well-dressed and gentlemanly person called at one of the principal schools of Granada, and represented himself to the teacher as a near relative of two of his young pupils. The boys were sons of a wealthy merchant of the city. The teacher, entertaining no suspicions of the purpose of his visitor, suffered him to take the boys along with him, under

pretence of purchasing some little present for them. Though they did not return so soon as was expected, little uneasiness was felt on their account, until the parents received a note informing them that their children were safe and well, and that they need entertain no apprehensions regarding them, but demanding a considerable sum of money as the condition of their being restored. The money has not yet been paid; all search has proved ineffectual; and the children are still in the hands of the thieves.'

Mr Robertson having put the chaplainship of the Presbyterian troops at Gibraltar on a better footing than hitherto, returned to his native country. His work is interspersed with many grave remarks concerning the morality of the British soldiers and sailors, to which attention cannot be too earnestly recommended, especially to those in power, who have the ability to cause the very great improvement which appears to be necessary in this respect. To all classes of readers, however, Mr Robertson's work will be found instructive and entertaining.

BIOGRAPHIC SKETCHES.

JOHN JOACHIM WINCKELMANN.

JOHN JOACHIM WINCKELMANN, the celebrated historian of ancient art, was born on the 9th of December 1717, at Stendal, a town of Prussia, about eighty miles from Berlin. His father belonged to almost the lowest rank of life, being in fact a cobbler, struggling not only with poverty but with disease, which, at an early period of Winckelmann's life, forced him to take refuge in an hospital. As the boy grew up, he showed great anxiety to go to school; but his parents were unwilling to lose even his trifling services, and it was not without much difficulty that he at last persuaded them to send him to the burgh seminary. Once there, the rector, Esaias Wilhelm Tappert, a very worthy man, was struck with his dawning genius and earnest perseverance. He offered to instruct him for less than the usual fee, and by procuring him at the same time admission into the choir, enabled him, without drawing on his father's scanty resources, to remain at school. Young Winckelmann proved the most apt and diligent of scholars; he seldom joined in the sports of his companions: generally, when they were playing, he might be seen conning some difficult passage of a classic, or learning by heart from a manuscript before him long lists of Greek and Latin words. With his industry and fine faculties he made such progress, that Tappert promoted him, while quite a stripling, to the rank of usher; some also of the Stendal burghers employed him in giving private lessons to their children; and with the trifling gains thus acquired, Winckelmann began to find himself contributing to the support of his parents.

In time, a closer intimacy sprang up between the rector and his young protégé. Tappert lost his eyesight, and the other became his daily visitor, read to him, wrote for him, and tried in a thousand ways to cheer his solitary hours. The chief want of Winckelmann, as of every poor student, that of books, was now supplied. He had free access to his patron's well-chosen library, and he read with avidity Homer, the Greek dramatists, and works on archaeology and history. Meanwhile he was giving indications of something rarer than even an industrious and affectionate disposition. He wished to travel, he used to say, when quite a child; above all, he longed to visit Egypt, that he might behold the pyramids. His innate love for objects of art began also to display itself, as well as it could in a place so sequestered as Stendal. Long after, when the poor cobbler's son had become a famous man, his companions remembered how he incited them, by the hope of some petty reward, to search the surrounding country for antiquarian remains; and, so recently as 1821, two Roman urns were to be seen in the library of the Stendal school, which were exhibited with pride as the product of one of these excursions.

When he had reached his seventeenth year, the kind Tappert despatched him to Berlin, with a letter of introduction to the rector of a gymnasium there, under whose roof he remained for a twelvemonth, alternately instructing and instructed. He was then recalled to Stendal, where his friend the rector placed him at the head of the choir. He spent the next four years in unremitting study, endeavouring at the same time to support himself and assist his family by teaching in public and in private. We have no detailed account of his life during this period. One anecdote only remains, which relates to his residence in Berlin, and deserves to be repeated as a pleasing illustration of his youthful enthusiasm. He had heard, it is said, that the library of the celebrated Fabricius was about to be sold at Hamburg, and he determined to proceed there on foot and be present at the sale. He set out accordingly, asking charity (a common practice with poor German students in their rambles, and not considered disgraceful) of the clergymen whose houses he passed on the road; and having collected in this way a little sum, he purchased on his arrival some of his darling poets, and returned to Berlin overjoyed with his success.

Winckelmann was now twenty-one, and it was quite time for him to choose a profession. His Stendal friends thought him fitted for the church, and they sent him to obtain the necessary qualifications at the university of Halle. He had no special inclination towards theology, but he obeyed in silence, and applied himself to it with his usual ardour. At Halle he had access to public libraries, and his studies seem to have been of the most miscellaneous kind, ranging from Homer and the higher mathematics, to medicine and the ponderous tomes of the feudal lawyers. At the end of two years he abandoned theology, probably because the help from home began to fail him. He remained at Halle for six months longer, arranging the library of one of the academic authorities; and then, with the small sum that he received for this, found himself thrown friendless upon the world. He was too poor to enter any profession, and a thousand vague wishes began to agitate his breast. His love of study had been confirmed into a habit: the magnificent gallery at Dresden, to which, on the occasion of some festivities, he had paid a flying visit, was ever before his eyes, and he resolved to devote his life to literature and art. Meanwhile his early passion for wandering revived, and he now put in execution a scheme which savours of less wisdom than might have been expected from a youth of twenty-three, who had seen something of the world. Fascinated with a fresh perusal of Caesar's Commentaries, he began, in the summer of 1740, a pedestrian journey to France, solely, his biographers assure us, to visit the scene of the great Roman's military exploits. As is usual in such cases, his funds were speedily exhausted; and when near Frankfort-on-the-Maine, he was compelled to retrace his steps. The most laughable part of the story remains to be told. Arriving at the bridge of Fulda, he remarked his own dishevelled, travel-stained appearance, and fancying no one near, resolved to remedy it. He had pulled out a razor, and was about to operate on his chin, when he heard a noise, and turning round, perceived a party of ladies, who, thinking him on the point of committing suicide, were shouting for help. The truth, however, was speedily explained, and the fair intruders, it is added, generously forced on his acceptance a gift of money sufficient for him to pursue his retreat in comfort.

Poor Winckelmann now discovered that life was made of sterner stuff than such romantic dreams. He went to Jena, and there, besides mastering Italian and English, struggled hard to complete his knowledge of medicine, with a view to making it a profession. But this scheme also, after a few months, poverty compelled him to forego. He became tutor in a family at Heimerleben, and during the year and a half which he spent there, devoted his leisure to historical studies, reading, we are informed, Bayle's dictionary twice through. At

last the correctorship of the school at Seehausen was offered him, with a yearly salary of 250 thalers, little more than L.35. Small as this was, it was a larger income than he had ever enjoyed: it enabled him to send something to his infirm and aged parents; accordingly he accepted the post with joy, and in the autumn of 1743 we find him installed at Seehausen.

During no period of his life does Winckelmann appear more deserving of our regard than in the years of obscure drudgery which he passed at Seehausen. He found, on his arrival, none of his scholars acquainted with more than the first rudiments of Latin and Greek; many were ignorant of their ABC; and the poorer ones could obtain no money from their parents for the purchase of the necessary school-books. Thus, in spite of his title of corrector, Winckelmann had little scope for the display of his fine genius and deep erudition. But nothing daunted, nothing discouraged him. He made, with his own hand, copies of such passages in the classical authors as his scholars became qualified to read, and these he distributed among them. He laboured and laboured, until at last things began to wear a flourishing aspect. Beyond the sphere, too, of his immediate duties, he found time both for his own intellectual improvement and for the indulgence of his kindly disposition. After school, he gave a few private lessons. In the evening, a favourite pupil, whom he instructed in philosophy and mathematics, remained till ten. Then Winckelmann belonged to himself. Seizing his Sophocles (a favourite author, of whom he was projecting a new edition), he read and annotated till midnight. When twelve struck, he never dreamt of going to bed, but, wrapping himself closely in an old fur cloak, leant back in his chair, and slept among his books till four. He then renewed his own studies for two hours more; at six the favourite pupil returned, and stayed until it was time to open school. Few scholars of Winckelmann's eminence have had, during the early portion of their career, so little leisure for private study; none ever turned that little to better account.

Five years of this laborious existence did not impair Winckelmann's health of body or cheerfulness of mind. He was modest and wise enough to be content with his situation, and might have remained all his life at Seehausen, had not some vexatious interference on the part of the school-inspector forced him reluctantly to leave it. After resolving on this step, he made several unsuccessful attempts to procure employment, and had finally made up his mind to betake himself to London, where, with his knowledge of languages, he hoped easily to obtain a situation as corrector of the press. Happily, during a brief visit to Dresden, in the June of 1748, he heard some one mention the vast collection of books which the Count Von Bünaü, at his estate of Nöthenitz, near Dresden, was then amassing and arranging. He penned immediately a modest letter to that nobleman, imploring the most trifling literary engagement. The count inquired into his character and accomplishments, was pleased with both, and offered his petitioner a subordinate post in his library, with a yearly salary of L.12! Winckelmann accepted the offer, received the money for his travelling expenses, hurried to Stendal, taking with him all the books he had through life painfully collected, commissioned a friend to sell them, and apply the proceeds in a weekly allowance to his father, to whom he bade farewell, and then proceeded, light of heart, to Nöthenitz.

The count was engaged in the composition of a history of the German empire, and Winckelmann's principal employment at Nöthenitz was to make such copies of, and extracts from, old documents as were to find a place in that work. He acquitted himself altogether to the satisfaction of his employer; nay, at first he laboured with such assiduity that his hair became gray: we do not find, however, that he received any more solid encouragement from his excellency than praises and kind words. Nevertheless, with board and lodging provided him, and a little leisure on his hands, Winckelmann was

for some time tolerably happy. He had a noble library at his command; from time to time he made excursions to Dresden, where he could converse with such men as Hagedorn and Oeser; and, still better, range at will through its picture-gallery and collection of antiquities. At last, what with the laborious fulfilment of his duties and the intensity of his private studies, even his Herculean strength gave way; his health grew daily worse; his drooping gait and emaciated frame betokened the approach of death; and his friends advised him, if he wished to live, at once to seek a warmer climate. Meanwhile (in the spring of 1751) Archinto, the papal nuncio at Dresden, came to Nöthenitz, and made, during his stay there, Winckelmann's acquaintance. He was charmed with his learning and exquisite taste, and, observing his debility, strongly recommended him to go to Italy. 'That,' cried Winckelmann, 'is the goal of all my wishes.' The nuncio begged him to pay him a visit at Dresden. There he introduced him to Father Rauch, the confessor of the king; and both hinted, among other things, that Winckelmann, by becoming a Catholic, might obtain a pension from the court of Dresden, and thus repair to Italy. Hints soon became persuasions: after long wavering, in an evil hour Winckelmann consented, and on the 11th of July 1754, abjured Lutheranism to enter the pale of the Romish church. Such changes, when they proceed from conviction, can never deserve to be visited with reprobation; but in this case, the most friendly of Winckelmann's biographers admit far other motives were at work. We learn with pleasure, that at the moment he was severely punished by the estrangement of his very dearest friends. At the same time, the Count Von Bünaü must not escape uncensured. Even the tolerant and aristocratic Goethe is indignant at his niggardly neglect: the acquisition of a book-rarity the less, nay, a simple application from a minister of his influence to the court of Dresden, would have furnished the slender aid which Winckelmann purchased at so dear a rate.

His excellency contented himself with being very angry, and Winckelmann was soon of course forced to quit Nöthenitz. He repaired to Dresden; and here he found himself moneyless as ever: Archinto was in Italy, and Rauch, though very polite, kept his hand closed. Meanwhile, Winckelmann (narrowly escaping starvation) projected, drew, wrote, and studied—the last generally in the Brühl library, where Heyne was then employed. 'It is a curious fact,' remarks Mr Carlyle, in his notice of the latter, 'that these two men, so singularly correspondent in their early sufferings, subsequent distinction, line of study, and rugged enthusiasm of character, were at one time, while both as yet were under the horizon, brought into partial contact. "An acquaintance of another sort," says Heeren, "the young Heyne was to make in the Brühl library, with a person whose importance he could not then anticipate. One frequent visitor of this establishment was a certain almost wholly unknown man, whose visits could not be specially desirable for the librarians, such endless labour did he cost them. He seemed insatiable in reading, and called for so many books, that his reception there grew rather of the coolest. It was John Winckelmann. Meditating his journey for Italy, he was then laying in preparations for it. Thus did these two men become, if not confidential, yet acquainted; who at that time, both still in darkness and poverty, could little suppose that in a few years they were to be the teachers of cultivated Europe, and the ornaments of their nation.'" For Winckelmann, both the 'darkness' and the 'poverty' were soon to be at an end. He found means, in the May of 1755, to publish his first book, the 'Reflections on Imitation of the Greeks in Painting and Statuary,' which was dedicated to the king, and brought its author high and sudden fame. A month or two afterwards, he received the promise of an annual pension of L.30; Rauch sent eighty ducats for travelling ex-

penses; and in the following October Winckelmann, now about to enter his thirty-ninth year, found himself at last in Rome.

It is not our intention to detail with the same minuteness the remaining thirteen years of Winckelmann's life, years of almost uninterrupted happiness. In Rome his health was completely restored; he needed little for the supply of his bodily wants, and that little he always obtained without difficulty. When his pension ceased, on the death, in 1759, of his patron Archinto, the Cardinal Albani invited him to become keeper of his collections, with an ample salary, and merely nominal duties. He was appointed by the Pope, in 1763, *Antiquario della Camera Apostolica*, or Superintendent of the Antiquities of Rome, an honourable post, congenial to his tastes. He lived on a familiar footing with the great and opulent; the most eminent of the artists resident in Rome were his daily companions; he had free access to the noblest collections of art in the world; and in the purest intellectual enjoyment and effort, he speedily forgot his past sufferings and struggles. Every foreigner of distinction who visited the Eternal City was proud to have Winckelmann for a cicerone: he himself delighted, when he found rank and genuine taste combined, to act in that capacity, and his conversation on such occasions was of the most brilliant and fascinating kind. The thoughts and emotions which were excited in him by the beautiful remains of antiquity, found moreover enduring expression in a long series of masterly writings. The principal of these, his *History of Ancient Art*, was begun in the second year of his residence at Rome, and published at Dresden in 1764.

The publication of this work raised him to the pinnacle of European celebrity, and more than one German potentate (the great Frederick among the rest) endeavoured, without success, to tempt Winckelmann to his court. His friends in Germany, however, prevailed upon him, in 1768, to pay them a visit; and, in the company of a Roman sculptor named Cavaceppi, he set out for his native country in the April of that year. But as the distance increased between him and his beloved Rome, he sank into a deep melancholy: when they were crossing the Tyrolean Alps, he pointed to the gloomy sky overhead, and exclaimed, 'Torniamo a Roma' (Let us return to Rome). Cavaceppi persuaded him to continue his journey, and they reached Ratisbon, where the Empress-Queen, Maria Theresa, was then residing. Winckelmann now resolved to go no further. The Austrian prime minister, Kaunitz, himself joined his expostulations to those of Cavaceppi in vain. He remained at Ratisbon till the end of May, and having been presented to the empress, who bestowed on him some costly medals in proof of her regard, proceeded to Trieste, where (preserving, we know not why, a strict incognito) he took an apartment in a hotel, purposing to sail to Italy in the first ship bound for Ancona.

He met at the common dining-table of the hotel an Italian stranger named Francesco Arcangeli, who, it afterwards appeared, had been banished for theft from the Austrian dominions. This scoundrel easily gained his confidence, by introducing him to the captain of a ship bound for Ancona, and by an agreeable and winning manner. The unsuspecting Winckelmann told him everything about himself except his name, and showed him the presents of the empress; these excited the Italian's cupidity. On Wednesday the 8th of June Arcangeli left the hotel early in the morning, and having made some purchases, returned to his room, where he remained for some time, and then (as he was daily in the habit of doing) paid a visit to Winckelmann in his apartment. The latter was sitting, without neckcloth or upper garment, at his writing-table, on which, as it chanced, there lay unfinished his literary testament. He rose to greet his guest, and they walked together up and down the room till ten, talking of his approaching departure. Winckelmann was in the gayest humour, spoke with enthusiasm of his patron Albani's splendid villa, and begged the other to come and visit

him at Rome. Suddenly, Arcangeli asked him to show the company at dinner that day the empress's medals. He refused. 'Will you tell me, then, what your name is?' 'No; I do not wish to be recognised,' was Winckelmann's reply; and, offended with the abruptness of the questions, he sat down, with his back towards the Italian, and began to write. Arcangeli immediately took from his pocket, and threw over Winckelmann's head, a knotted cord, which, as he started up, tightened round his throat. They closed, and had struggled together for a short time, when Arcangeli drew a knife and plunged it into his victim. At this moment a servant, hearing the noise, rushed up and opened the door, through which Arcangeli escaped unpursued. It is needless to protract the catastrophe. Physicians were summoned; but all was vain; and at four in the afternoon Winckelmann expired. The assassin was some weeks afterwards captured, tried, and executed.

The news of this unexpected, mysterious, and melancholy death, was received with regret throughout all Europe, especially in Germany, where many of his admirers (the youthful Goethe among the number) were ignorant of Winckelmann's abrupt return towards Italy, and were preparing to welcome him with enthusiasm. We have left ourselves no room to speak of his works: his biography is now before the reader. We wish that Winckelmann, by avoiding the fatal error of apostasy, had allowed us to say that his was a life altogether worthy of a scholar and a man.

EVENINGS WITH THE OLD STORY-TELLERS.

We can confidently recommend to young persons, and to the attention of all who have charge of them, a small and cheap, but elegant volume, entitled '*Evenings with the Old Story-Tellers*,' being a member of a series entitled *Burns's Fireside Library*, in which we find many excellent reprints and adaptations prepared with remarkable taste, and even elegance, notwithstanding the small prices at which they are published. The particular volume here referred to contains a connected series of examples of the stories popular in the middle ages, chiefly from the well-known collection called the *Gesta Romanorum*; the translations being only executed by the editor where there did not exist happier versions by authors of established reputation. These stories, with their unscrupulous supernaturality, their allegorically-religious characters, and primitive ideas with regard to the course of nature and providence, are a curious and interesting study; nutritive of the imagination and feelings, at the same time that they have a historical value as exponents of European opinion in past ages. They are here very pleasantly strung upon a series of conversations represented as taking place in one of the Oxford colleges. The following may serve as a specimen of the collection:—

JOVINIAN THE PROUD EMPEROR.

In the days of old, when the empire of the world was in the hands of the lord of Rome, Jovinian was emperor. Oft as he lay on his couch, and mused upon his power and his wealth, his heart was elated beyond measure, and he said within himself, 'Verily, there is no other god than me.'

It happened one morning after he had thus said unto himself, that the emperor arose, and summoning his huntsmen and his friends, hastened to chase the wild deer of the forest. The chase was long and swift, and the sun was high in the heavens when Jovinian reined up his horse on the bank of a clear bright stream that ran through the fertile country on which his palace stood. Allured by the refreshing appearance of the stream, he bade his attendants abide still, whilst he sought a secluded pool beneath some willows, where he might bathe unseen.

The emperor hastened to the pool, cast off his garments, and revelled in the refreshing coolness of the waters. But whilst he thus bathed, a person like to him in form, in feature, and in voice, approached the river's bank, arrayed himself unperceived in the imperial garments, and then sprang on Jovinian's horse, and rode to meet the huntsmen, who, deceived by the likeness and the dress, obeyed his

INBURGH JOURNAL.

the duke looked on him, but knew him not. And when Jovinian reiterated his story, and spoke angrily unto the duke, he pitied him. 'Poor mad fellow,' said the good duke, 'I have but just now returned from the palace, where I left the very emperor thou assumest to be. Take him to the guard-house. Perhaps a few days' close confinement on bread and water may cool his heated brain. Go, poor fellow; I pity thee!'

So the servants did as their lord commanded, and they fed Jovinian on bread and water, and after a time turned him out of the castle; for he still said he was the emperor. So sorely and bitterly did the emperor weep and bewail his miserable fate when the servants drove him from the castle gate. 'Alas, alas!' he exclaimed in his misery, 'what shall I do, and whither shall I resort? Even the good duke knew me not, but regarded me as a poor madman. Come, I will seek my own palace, and discover myself to my wife. Surely she will know me at least.'

'Who art thou, poor man?' asked the king's porter of him when he stood before the palace gate, and would have entered in.

'Thou oughtest to know me,' replied Jovinian, 'seeing thou hast served me these fifteen years.'

'Served you, you dirty fellow,' rejoined the porter. 'I serve the emperor. Serve you, indeed!'

'I am the emperor. Dost thou not know me? Come, my good fellow, seek the empress, and bid her, by the sign of the three moles on the emperor's breast, send me hither the imperial robes, which some fellow stole whilst I was bathing.'

'Ha, ha, fellow! Well, you are royally mad. Why, the emperor is at dinner with his wife. Well, well, I'll do thy bidding, if it be but to have the whipping of thee afterwards for an impudent madman. Three moles on the emperor's breast! How royally thou shalt be beaten, my friend.'

When the porter told the empress what the poor madman at the gate had said, she held down her head, and said with a sorrowful voice unto her lord, 'My good lord and king, here is a fellow at the palace gate that hath sent unto me, and bids me, by those secret signs known only to thou and me, to send him the imperial robes, and welcome him as my husband and my sovereign.'

When the stitious emperor heard this, he had the attendants bring in Jovinian. And lo! as he entered the hall, the great wolf-hound, that had slept at his feet for years, sprang from his lair, and would have pulled him down, had not the attendants prevented him; whilst the falcon, that had sat on his wrist in many a fair day's hawking, broke her jesses, and flew out of the hall—so changed was Jovinian the emperor.

'Nobles and friends,' said the new emperor, 'hear ye what I will ask of this man.'

And the nobles bowed assent, whilst the emperor asked of Jovinian his name, and his business with the empress.

'Askest thou me who I am, and wherefore I am come?' rejoined Jovinian. 'Am not I thy emperor, and the lord of this house and this realm?'

'These our nobles shall decide,' replied the new king. 'Tell me now, which of us twain is your emperor?'

And the nobles answered with one accord, 'Thou dost trifle with us, etc. Can we doubt that thou art our emperor, whom we have known from his childhood? As for this base fellow, we know not who he is.'

And with one accord the people cried out against Jovinian that he should be punished.

On this the usurper turned to the empress of Jovinian—'Tell me,' said he, 'on thy true faith, knowest thou this man, who calls himself emperor of this realm?'

And the empress answered, 'Good, my lord; have not thirty years passed since I first knew thee, and became the mother of our children? Why askest thou me of this fellow? And yet it doth surprise me how he should know what none save you and I can know.'

Then the usurper turned to Jovinian, and with a harsh countenance rebuked his presumption, and ordered the executioners to drag him by the feet by horses until he died. This said he before all his court; but he sent his servant to the jailer, and commanded him to scourge Jovinian, and for this once to set him free.

The deposed emperor desired death. 'Why,' said he to himself, 'should I now live? My friends, my dependents, yea, even the partner of my bed, shun me, and I am desolate among those whom my bounties have raised. Come, I will seek the good priest, to whom I so often have said

open my most secret faults: of a surety he will remember me.

Now the good priest lived in a small cell nigh to a chapel about a stone's cast from the palace gate; and when Jovinian knocked, the priest being engaged in reading, answered from within, 'Who's there? Why troublest thou me?'

'I am the Emperor Jovinian; open the window; I would speak to thee,' replied the fugitive.

Immediately the narrow window of the cell was opened, and the priest, looking out, saw no one save the poor half-clothed Jovinian. 'Depart from me, thou accursed thing,' cried the priest; 'thou art not our good lord the emperor, but the foul fiend himself, the great tempter.'

'Alas, alas!' cried Jovinian, 'to what fate am I reserved, that even my own good priest despises me? Ah me! I bethink me; in the arrogance of my heart I called myself a god. The weight of my sin is grievous unto me. Father, good father, hear the sins of a miserable penitent.'

Glady did the priest listen to Jovinian; and when he had told him all his sins, the good priest comforted the penitent, and assured him of God's mercy if his repentance was sincere. And so it happened that on this a cloud seemed to fall from before the eyes of the priest; and when he again looked on Jovinian, he knew him to be the emperor, and he pitied him, clothing him with such poor garments as he had, and went with him to the palace gate.

The porter stood in the gateway, and as Jovinian and the priest drew near, he made a lowly obeisance, and opened the gate for the emperor. 'Dost thou know me?' asked the emperor.

'Very well, my lord,' replied the servant; 'but I wish that you had not left the palace.'

So Jovinian passed on to the hall of his palace; and as he went, all the nobles rose and bowed to the emperor; for the usurper was in another apartment, and the nobles knew again the face of Jovinian.

But a certain knight passed into the presence of the false emperor. 'My lord,' said he, 'there is one in the great hall to whom all men bow; for he so much resembleth you, that we know not which is the emperor.'

Then said the usurper to the empress, 'Go and see if you know this man.'

'Oh, my good lord,' said the empress, when she returned from the hall, 'whom can I believe? Are there, then, two Jovinians?'

'I will myself go and determine,' rejoined the usurper, as he took the empress by the hand, and, leading her into the great hall, placed her on the throne beside himself. 'Kinsfolk and nobles,' said the usurper, 'by the oaths ye have sworn, determine between me and this man.'

And the empress answered, 'Let me, as in duty bound, speak first. Heaven be my witness, I know not which is my lord and husband.'

And all the nobles said the same.

Thereupon the feigned Jovinian rose and spake: 'Nobles and friends, hearken! That man is your emperor and your master; hear ye him! Know that he did exalt himself above that which was right, and made himself equal unto God. Verily he hath been rewarded. He hath suffered much indignity and wrong; and, of God's will, ye knew him not. He hath repented him of his grievous sin, and the scourge is now removed. He has made such satisfaction as man can make. Hear ye him, know him, obey him.'

As the feigned emperor thus addressed the astonished nobles, his features seemed illumed with a fair and spiritual light, his imperial robes fell from off him, and he stood confessed before the assembly an angel of God, clothed in white raiment. And as he ended his speech, he bowed his head, and vanished from their sight.

Jovinian returned to his throne, and for three years reigned with so much mercy and justice, that his subjects had no cause to regret the change of their emperor. And it came to pass, after the space of three years, the same angel appeared to him in a dream, and warned him of his death. So Jovinian dictated his troublous life to his secretaries, that it might remain as a warning unto all men against worldly pride, and an incitement to the performance of our religious duties. And when he had so done, he meekly resigned himself, and fell asleep in death.

The moral of the story is thus given:—'Jovinian was but the picture of the proud, worldly-minded man, entirely given up to vanity and folly. The first knight whose castle he visited was True Wisdom, ever disdain-

ful of the pomps and vanities of the world. The next knight was Conscience. The dog that turned against his old master was the lusts of the flesh, our own evil desires, which will ever in the end turn against those who have pampered them. The falcon is God's grace; the empress, man's soul; and the clothes in which the good priest clothed the half-frozen emperor are those kingly virtues which he had thrown off when he gave loose to the vanities of the world.

SAVINGS' BANKS IN FRANCE.

THE establishment of savings' banks, recognised as they now are by government, is a measure calculated to benefit the humbler classes of society. The advantages they offer are twofold—safe custody, and 'improvement' by interest. The poor man cannot command the same facilities with his scanty savings as the rich man with his large accumulations; he does not find it easy to meet with fit persons who will take charge of it; and if he retains it in his own possession he makes no profit, and is exposed to the chance of being plundered. Here, then, the savings' banks afford him the opportunity of making a secure deposit, whether for present or for future use. Once in the safe keeping of the bank, the sum may become a nucleus of accumulation, and is beyond the risk of improvident emergencies. The greatest difficulty with working men is to lead them to acquire the first habits of order, foresight, and economy. Induce a labourer or an artisan to deposit even the smallest saving, week by week, until the entire sum shall amount to £5, and it is certain that, before arriving at that period, he will become sensible of the propriety and the necessity for saving. He will appear a new individual; one who no longer regards himself as an outcast, without a future, but who will take and maintain his standing among the producers and preservers of national wealth. His conduct will become more regular, his habits more moral; he will be a better workman, better husband, father, and citizen.

From a little work written on this subject by Baron Charles Dupin,* we learn that savings' banks were introduced into France soon after their legal establishment in England. A model bank, presided over by the duke of Laroche-foucauld-Liancourt, was started in Paris in the year 1818, from which date up to the year 1830, only twelve others were instituted, and those were all in the departments; that is, the country. In 1831, a year remarkably fatal to the interests of the working population, no new bank was founded; but in 1832, when the effects of the Revolution of July began to be felt in popular institutions, four others were established; in 1833, nine; forty-eight in 1834; and at the present day, France contains four hundred and fifty savings' banks, showing a remarkable and rapid progress, which impressively illustrates the blessings and advantages of peace.†

In 1830, the year of the Revolution, the deposits in the savings' banks in France amounted to £207,824, and the sums drawn out to £150,276, being £100,000 more than in the previous year. In 1831—a year characterised by riots at Lyons and Paris, and great commercial distress, when the poor were excited against the rich, and civil war showed its head for a moment—

* Histoire, Constitution, et Avenir des Caisses d'Épargne de France. Paris: 1844.

† The first savings' bank in England was started, but unsuccessfully, in the year 1798. The idea was adopted with better success in Scotland in 1807 by the minister of the parish of West Calder, who instituted a bank for his parishioners; and afterwards, in 1810, by Henry Duncan, minister of Ruthwell, in Dumfriesshire. The latter took the care of the administration of the establishment upon himself, and published the result in a well written pamphlet, in which he explained the system and its advantages, and succeeded in drawing public attention to the enterprise. In 1813, Sir William Forbes established the bank of Edinburgh upon a plan which served as a model to all that succeeded it. From the additional experience gained by the experiments in Scotland, the original bank was founded in London within a year or two afterwards, under the management of Mr Baring.

the sums withdrawn were less by L.60,000 than in 1830. In 1832—when France, in common with other countries, was visited by the cholera, when the deaths in Paris increased from their usual average of 25,000 to 48,000—the deposits were L.125,808, and the sums withdrawn L.122,668. The statistics of the succeeding years are not given; but in 1842, it appears that the deposits amounted to L.3,800,000; a proof, as Baron Dupin observes, that the people have begun to appreciate the peaceful tendencies of the age.

In 1815, an attempt was made to unite the savings' banks of Paris with the *Monts Piétés*, or pawnbrokers' institutions. This plan had been adopted in other parts of the kingdom, but was successfully resisted in the capital. One of the strongest objections urged against it was the check it would give to depositors, from the repugnance that many would feel to enter an establishment in which it might be supposed they placed pledges rather than deposits. Baron Dupin avails himself of the statistics of the *Monts Piétés* to draw a few conclusions as to the physical condition of the people at certain periods. He takes the first quarters of the years 1837, 1838, and 1839 respectively, and finds that 1838 presents the most favourable indications, and 1839 the most unfavourable; while the amount of pledges, for the three quarters taken together, exceeded that of objects redeemed by L.117,480. There is one other point of view which these returns present of the condition of the community, relating to their means of recreation. The Easter festivities are regarded by the working population of Paris with especial favour: they make every exertion to redeem their wearing apparel, in order to take part in the general holiday. The tables show, that in 1837 the amount for articles withdrawn exceeded that of pledges by L.1604; in 1838, by L.1408; but in 1839, a year of distress, the pledges were in excess to the amount of L.15.

These facts are interesting, although not strictly connected with the subject under consideration. We have introduced them, to show the wide views taken by Baron Dupin in his inquiries, which are those of a philosopher earnest for the truth. He goes on to draw a comparison between the banks of Paris and those of London during a period of eighteen years, when, making allowance for the difference of population, the balance, as regards the number of depositors, is in favour of the former city by more than half; but when the counties of England are compared with the departments of France, the returns of the former are as 12 to 1 of the latter. The comparison is then extended to various cities and towns of France, the result of which is shown in a table giving the number of depositors to every 1000 inhabitants; and here it is justly observed, that the savings' banks may be taken as a moral index of the state of the population. In Metz, the chief town of the department of the Moselle, the proportion of depositors is 71 to each 1000 inhabitants; while in the commercial city of Lyons it is only 3 to the 1000: in the department of the Rhone, in which the latter city is situated, each 1000 of the population contributes L.322 annually to the lotteries; in the Moselle, for the same number, the contribution is L.20. This is public gaming; but in private the result is still worse. For the same numbers, the duty on playing cards, in the Rhone department, is L.5; the Moselle, eight shillings. The actual state of the respective localities confirms these conclusions. In Metz, many excellent schools of popular instruction have been established by men eminent for their zeal and disinterestedness, which comprehend the teaching of adults, and the application of science to the arts and to the business of daily life. There reason, prudence, and virtue are held up as honourable to the career of the working man, at the same time that he is improved in his knowledge of his peculiar occupation: but at Lyons everything remains to be done: the higher classes have yet to learn 'the pleasure of succouring the weak; and the latter, the happy experience of gratitude for enjoyed benefits.'

With regard to the moral progress of the population of Paris, we are informed that, a quarter of a century ago, they threw L.1,160,000 annually into the lotteries; but now not a sixpence is expended in this way: formerly, L.240,000 to L.360,000 were lost in other fatal games of chance, now unknown. Gaming-houses, scandalously tolerated or authorised, devoured alike the abundance of the rich and the last son of the poor: they are now abolished by the laws. Then, the practice of economy was unknown or neglected among the working-classes, now they save L.1,440,000 annually; and the number of depositors, of which *bona fide* workmen constitute three-fourths, increases from 12,000 to 14,000 every year. The proportion of paupers, as well as of illegitimate births, is also diminishing, but with deplorable slowness. At the commencement of the era, 205 in every 1000 births were abandoned; now only 120; which, observes Baron Dupin, 'are 120 too many.' The streets and public places do not present the same aspect of debauchery and unmitigated license as before. Thus far the results are favourable and gratifying; but we learn that, on the other hand, one third of the population is, at the present time, living in a state of concubinage, one third of the children is illegitimate, one third of the deaths takes place in the pauper wards of the hospitals, uncared for or unwept by the surviving relatives; such are the morals of Paris—Paris ameliorated. Baron Dupin endeavours to account for this state of things by the fact, that two thirds of the population have not yet come forward as depositors in the savings' banks, and of those who do so, many do not deposit their savings oftener than once in six months; while others grow indifferent, and cease to deposit at the end of five or six years. The savings' bank in such a case, instead of being the perpetual treasury of the people, is in reality, for the mass, only the magic lantern of transient economy.

At the present day, savings' banks are to be found in 450 cities and towns of France, in which places 600,000 families, the élite of the working-classes, have confided to the treasury of the state more than L.1,360,000, saved penny by penny, the fruits of their self-denying industry. Soldiers and seamen, to the number of 40,000, are possessors of L.1,240,000, which, every year, at the expiration of their term of service, enables them to buy a small portion of land, or the tools of a trade, in order to live honourably and actively after having served their country. Of the 80,000 national guards, one half are depositors; and, taking the whole kingdom, there are 35,000 clerks in public or private establishments whose deposits amount to L.1,400,000. A similar sum is held by 96,000 orphans and 46,000 widows; two classes who are thus sheltered from the privations usually attendant on their bereaved condition. The number of workmen and domestic servants enrolled as depositors is 250,000; the amount of their deposits is not stated; but the number is continually increasing. Last on the list appear 140,000 labourers, the owners of L.400,000.*

Baron Dupin concludes with an appeal to the good sense of the working-classes. 'Our commercial laws are free: all may rise: an iron barrier no longer excludes the workman: the only conditions required are, that he be active, intelligent, and industrious. Many names might be cited, now associated with honour and splendour, whose owners were originally workmen, who began by depositing a shilling in the bank.' He then indulges in a little national feeling, and anticipates the time when the present monarch of France may say, 'I found L.240,000 in the people's banks, and leave therein L.40,000,000.'

We close this article with a few lines from Mr Tidd Pratt's work on savings' banks. 'Every person who has vested his savings in the public funds has a stake in the security of the country, proportioned not merely

* The present number of depositors in the savings' banks of the United Kingdom exceeds 950,000; the amount of deposits is nearly L.97,000,000 and a half.

to the sum total of those savings, but to the value of that sum to himself, and will be deterred from compassing the disturbance of his native land by a personal motive, added to the influence of duty. He will feel the importance of public peace and public credit with that strong conviction which individual interest never fails to inspire; and, in answer to the objections of those who would be jealous of the support thus obtained to the ruling powers, it should be observed, that he who possesses property in a country is not interested in the stability of the administration for the time being, but in the perpetual stability of universal order and good government.'

RURAL NOTES—ALGÆ, OR SEA-WEEDS.

[This little paper is abridged from the *Inverness Courier* newspaper. It is interesting as a fair specimen of the compositions of the numerous reflecting and observant men scattered over our country in the capacity of land-agents; and we have no doubt that its thoughtful reference to nature at large will, with most of our readers, be sufficient to excuse the local application of some of its details.]

We have a great and growing antipathy at the term *weed*, and cannot help coming to the belief that Dr Johnson was not following his *own* nose when he defined weed as an herb 'noxious or useless,' as we apprehend such an anomaly as a weed, in the sense entertained by the doctor, has no place in nature. The doctor, if he had exercised his own judgment in the matter, would, we are convinced, have come to a different conclusion, and would, or at least should, have defined it 'an herb, the use of which is not yet understood.' With all due deference to the great lexicographer, and as the term is probably too firmly fixed in our language ever to be eradicated, we would define weed as an agent for gathering, arranging, and storing up matter below the reach of, and intangible to, animal and the higher grades of vegetable life; thus fulfilling a great and mighty end in the scheme of creation—the gathering together of the stray substances which, amid nature's varied manufactures, has as it were slipped through her fingers, and would have run to waste, and converting them, by sure and certain processes, into tangible and useful compounds.

In the article of the algæ, or sea-weeds, we are particularly struck with the economy of nature in so singularly adapting the means to the end. The office of these plants is to collect the stray substances held in solution by the salt water, particularly the alkalies and phosphates; and as these have to be extracted from the water, and not from the earth beneath it, the plants have no roots, properly speaking, but simply processes for clinging to the hard and flinty rocks, as points of attachment; while, at the same time, in place of a firm and erect stem to keep the branches and leaves expanded, as in terrestrial plants, and which would be cumbersome and unhandy for plants which change their medium as often and as regularly as the tides, they are furnished with innumerable air-bags or vessels for accomplishing this purpose, so that the branches and leaves of the plant may come in contact with the greatest possible quantity of water consistent with its size—these air-vessels serving the double purpose of furthering the plant in its destined office, and when this is accomplished, floating it to our shores and beaches to be applied to useful purposes.

In sailing or steaming round our west and northern coasts in the months of April and May, one is struck with the number of boats and men, and horses and carts, and women and boys, and creels, all busily employed at ebb tide in cutting and carrying away sea-weed from the shores, for the purpose of manuring the fields; and when we think of the immense quantities of potatoes raised almost exclusively by this manure, and the number of people who live upon them not only in the country, but in the towns to which they are exported, we must come to the conclusion that the algæ, or sea-weeds, are a tribe of plants of vast importance to a large section of the population of Scotland at least; and, when taken in conjunction with the peaty and waste soils round our coasts, almost invaluable, as no species of manure reduces a rough peaty soil so quickly to a state fit for the production of human food. There is no need of waiting for the 'meliorating effects of the atmosphere' where there is plenty of sea-weed. The lotter, with sea-weed at command, commences his spring labour at the middle of April, and by the middle of May, if the weather

be propitious, will have planted potatoes sufficient to serve a numerous family all the year round; and that on the most forbidding peaty soils, never before touched by the spade of man, and of the value, in its natural state, of some three-halfpence or twopence per Scotch acre. This is always done on what is called the lazy-bed system, which, in spite of the name, is perhaps the best system for 'bringing in' all rough, deep, peaty soils, as the lotter can always calculate on a crop the first season by this mode—an immense affair to a person whose capital or stock in trade consists merely of his 'thews and sinews.'

If we may judge from the scramble there is for sea-ware all over the thickly-peopled parts of our sea-coasts in March, April, and May, there is evidently a very great demand and want of sea-ware for agricultural purposes; as, besides the great breadths annually cut from the shores at spring tides, hundreds of boats and men are yearly employed dragging it from the bottom with grappling irons—and a most laborious and tedious operation it is—to eke out the scanty supply, and which supply will become yearly more scanty as population increases and waste lands are being taken in. With these views, I need not say that I believe an increase of the sea-ware round our coasts would be a very great blessing and advantage, and would form a permanent source of subsistence to thousands yet unborn; and I am gratified to say that this can be accomplished to a very great extent in a great many situations, and at an expense not likely to prove a barrier in this age of overflowing capital. It is well known that sea-weed prevails most on our rocky coasts; and the reason of this simply is, that the weed requires a point of attachment—something tangible and steadfast to hold by—that it may spread its branches and leaves to catch the stray matter held in solution by the water. With this point of attachment, nothing further is required to constitute a perennial field of algæ; nature does all the rest. And hence there need be no dread of greedy and slothful tenants over-cropping the land, dissipating the phosphates, and allowing the drains to choke up, and forgetting to pay the percentage on the capital you had invested in them. This is a bargain you are making with nature, and she never repudiates. Here, for once, that wise old saw of that wise old cock, Franklin—namely, that always taking out of the meal tub, and never putting in, soon runs to the bottom—is rendered null. There is nothing but cut and come again with the sea-weed; it is, in fact, a modern exemplification of the widow's cruise and the barrel of meal on a gigantic scale. In walking along the sea-coast at ebb tide, we see that, wherever a beetling cliff projects into the sea, and, as a consequence, the shattered rocks that tumble down from time to time are strewn along the beach, here it is that the sea-weeds are most luxuriant. Now, what nature does in this case we can do artificially, and that to our advantage, as, from the laws that govern falling bodies, the beach must have a certain inclination before the shattered rocks can roll into, and remain in, the zone where the algæ naturally grow. Now, the inclination required to be so great where stones roll in by their own gravity, that the breadth of this zone is consequently greatly narrowed, and instead of having a breadth of sea-weed—as we may have artificially—of a half, or even a whole mile, we have frequently only a few yards.

All that is necessary to constitute a field of sea-weed, is to strew the shore under high-water mark with rough boulders from the nearest cliff; and in order that the shores may be regularly planted, the stones should be regularly laid down at the rate of about one in every yard square. This 'planting' of the shores is not at all a new thing, but has been practised on a small scale in various parts of the Highlands, and, in every instance that I have heard of, with the very best success. I lately visited a small patch that had been thus artificially done, some twenty or twenty-five years since, and was quite pleased with the result, as it looked better than any natural piece of sea-ware within miles of it. The piece consisted of about one-third of a Scotch acre, and was done by a small lotter in liquidation of arrears of rent. He, the lotter, I believe, still enjoys the sea-ware of this piece, which he and a neighbour of his assured me could be easily disposed of at 24s. every two years, or 12s. yearly, being at the rate of 36s. yearly per Scotch acre. I could not so easily ascertain the expense the job had actually cost, as your genuine Celt has an innate caution about him in all matters relative to pounds, shillings, and pence, and has as much dread of breaking through or establishing any precedent that may hereafter infringe his interests, as any lawyer who ever sat

at the Queen's Bench. I, however, understood that the job had been the 'dernier resort' of the landlord, and probably cost twice as much as it would have done under ordinary circumstances.

In looking at the job, I had no doubt that it could have been done in the present day at about L.8 or L.10 per Scotch acre. Supposing, then, the value of an acre of sea-weed at 30s., and the expense of creating it L.10, the investment would be something about a seven years' purchase—no bad 'spec,' one should think, in the present state of the money market; and in stock as permanent as the earth itself.

In carrying out improvements of this kind, little engineering skill is required. The only thing to be considered is the nature of the rock or stone to be laid down; and, contrary to what one would expect, land stones are greatly superior to stones taken from either salt or fresh water, and in all cases give, and continue to give, a much superior crop. The reason of this seems simply to be, the smoothness of the surface of rolled or water-worn stones not permitting the seeds of the plant, in the first instance, to form a lodgment; and, in the second place, being too smooth for the fibrous attaching apparatus of the plant to keep a permanent hold of. In regard to the size of the stones, little nicety is required; large stones will do equally as well as small; but it is evident they will be much more expensive in first laying down. Stones of from twenty to forty pounds would be a very handy size, and such as carry a close covering of lichens, and break with a rough granular fracture, will probably answer best. When too small, they are apt to be carried out to sea, or cast upon the beach when under a full crop of buoyant sea-weed. The convenience and accessibility of the situation will naturally influence the planter; as also the risk of the new-laid stones being lifted or sanded up; but this is easily guarded against. When we look at the miles and miles on end of barren gravel and sand on some of our sea-coasts, without one vestige of vegetation, and our eye at last rests on some rocky corner abounding in marine vegetable life, we are struck with the difference, but merely imagine that this corner, somehow or other, is favourable to the growth of sea-weed. We do not advert to the fact, that the sea is imbued with the same qualities and influences on the barren and gravelly beach as in the rocky and weedy corner; nevertheless it is the same. The rent and shattered rocks precipitated into the sea from the cliffs above is the work of nature in her incessant career of building up and pulling down. This operation we can happily imitate, to the extent at least of strewing our shores with the fragments of our mountains; while nature at the same time 'bears a hand,' and clothes these fragments with perpetual verdure.

BRIEF LIFE OF THE 'ITALIAN BOYS.'

The following affecting passage occurs in the recently published 'Address' of a society formed for the protection and education of those wanderers, of whose history and mode of life a sketch was given in No. 622 of our former series:—Of the poor Italian boys who have so long enlivened our streets with almost the only music which could be had out of the concert or drawing-room, hundreds are the victims of a set of men who periodically visit Italy, and convert the face of that lovely land into a slave-market, selecting chiefly from the mountains the little creatures whom we see daily around us, making an agreement with the parents to house, feed, and clothe them for a term of years, and at the end of that time to set them free with a certain sum—seldom or never paid. The boys arrive here, and then what is their condition? Day after day, early and late, in the hottest time of summer, in the stormiest and most inclement of winter, are these poor fellows forced to drag along their heavy organs from street to street; they have to live as they best can on the casual charity of passers-by; they are expected to bring home a certain sum daily; and also frequently towards nightfall—not daring to meet their masters without the stipulated amount—they may be seen begging pitcously. Their clothes are filthy rags; their lodging is of the most miserable description. They are huddled together in one of the most unhealthy, the most crowded, the lowest localities of London, in small, ill-ventilated rooms, many in a room, worse housed than animals, badly as slaves ever were. From being so many hours a-day under the weight of a heavy organ (to say nothing of their long exposure, ill-clad and ill-fed, to our fickle

climate), they contract fearful disorders, such as hernia, varicose veins, diseases of the spine, &c.; and it has been calculated by a medical man, one of their own countrymen, that the average duration of time during which they can continue such occupation is about *eight years*, by which time their constitutions are utterly broken down. 'We know,' says a public journal, commenting upon this passage, 'of but one cure for this species of importation, and that is, a universal public agreement never to give these beggars *any money to carry to their masters*. Let them once learn that the trade is unprofitable, and it will assuredly cease.'

THE MAIDEN AND THE LOOKING-GLASS.

FROM THE GERMAN OF HEINRICH DOERING.

MAIDEN.

HATEFUL MIRROR! prithee say,
Why torment me every day?
Why to abatter these provoke me?
Spiteful thing! I here invoke thee:
Why detect each summer stain?
Ever glad to give me pain?
Every spot malicious show,
Though unseen by any beau?

MIRROR.

Maiden! wherefore thus complaining?
'Tis unjust. I love not paining
Thee, nor any other beauty;
To each and all I do my duty.
To praise or blame I'm always ready—
Fearless—faithful—honest—steady:
To tell the truth to every creature,
Is part of my transient nature!

MAIDEN.

Hence! I hate thee! get away!
More unsufferable each day
Thine unfeeling bluntness grows,
Blemishing each charm that glows
O'er a form—a face so fair,
All my lovers say, and swear,
Angels in their forms divine,
Scarce in brighter beauty shine!

MIRROR.

Maiden, maiden! blustering youth,
Hectoring over sense and truth,
Who such shameless flatteries lavish,
Would thy sober senses ravish!
Coming years each grace will banish,
And these false ones all shall vanish:
Say—shall thy true friend be broken?
Be it so—the words are spoken.
I am ready for the worst.
Strike!—but thou must promise first,
Heartless fops that fawn and flatter,
With indignant scorn to scatter
From thy presence, like a haze
Of stinging gnats in summer days;
Trust me, then, thy woman's heart
From thy true friend will not part.
Anger for a time controls
Vanity's misguided souls.
Thou'rt all too noble, and too pure,
Long such thralldom to endure.
Nor would'st thou break this heart of mine:
Thou wilt but firmer intertwine
Our bonds of love!—since now thou'rt 'ware
Of vanity's perfidious snare.

London, Feb. 1845.

E. L.

DUTY.

Duty is far more than love. It is the upholding law through which the weakest become strong, without which all strength is unstable as water. No character, however harmoniously framed and gloriously gifted, can be complete without this abiding principle: it is the cement which binds the whole moral edifice together, without which all power, goodness, intellect, truth, happiness, love itself, can have no permanence; but all the fabric of existence crumbles away from under us, and leaves us at last sitting in the midst of ruin, astonished at our own desolation.—
Mrs Jameson.

UPRIGHT, DOWNRIGHT, AND STRAIGHT-FORWARD.

It is very common to say of such a man that he is 'upright,' it is not less common to say of such another that he is 'downright,' or of a third that he is 'straight-forward.' Occasionally, the same person is said to be both upright and downright, and even straightforward, all at the same time; and we now and then hear a man called upright one day, downright another, and straightforward on the next. It would thus seem that the words are to some extent synonymous. It will be found, however, on examination, that they have a moral meaning as distinct and definable as their more obvious and physical significations. Popular usage, in fact, required three words to express three distinct varieties of character, and adopted these, all of good Saxon descent, to supply the want. Thus a downright man, although he may be an upright one, is not necessarily so, and *vice versa*; and the straightforward man may possess qualities which are not inherent to, and of necessity existing in, the character of either.

Mr Smith, for instance, is an upright man. He acts with fairness in all his dealings. He would wrong no man of a farthing. He would not injure his neighbour by word or deed. His fame is pure before the world. His word was never broken; and his promise is as good in the market as another man's bond. He holds up his head, is not ashamed to look anybody in the face, and walking erect in the dignity of conscious honesty, is called upright accordingly.

Mr Brown, again, is a downright man. He may or may not exhibit the moral rectitude of Mr Smith. He may not, strictly speaking, be an upright man; but he does not thereby forfeit his title to be classed among the downright. The phrase implies not so much a moral quality, as a manner and a peculiarity. The upright man may hold his tongue; but the downright man will speak out, loudly and boldly, without fear of the consequences. Mr Brown always allows his indignation to find vent. He speaks his mind; and if he combines both uprightness and downrightiness, calls a rogue a rogue, and a lie a lie, and cares not whom he offends by so doing. A great conqueror is, with him, a great murderer; a duellist, an assassin; a fraudulent bankrupt, a robber. He condemns in plain terms what he does not approve, and never deals in innuendos, 'or hints his doubts.' Neither will he indulge in courtesies when his mind is full of bitter meanings, and call him an 'honourable gentleman' whom he imagines to be the very reverse, nor designate another as his 'noble friend' whom in his heart he considers his very ignoble enemy. He has no patience with, or toleration for, any kind of terms which tend to gloss over error. Even where no deception is attempted, he does battle on behalf of plain

speaking. When people talk of operatives, he talks of workmen; the endearing word 'wife' is not banished from his vocabulary for that of 'lady'; and 'man' is a word of dignity and significance with him, instead of being degraded to imply something the opposite of a gentleman. If a man who is not habitually downright were to say a tithe of the strong things that Mr Brown may say with impunity, he would get knocked down for his frankness; but the very audacity of the downright man takes the world by surprise, and forces it into admiration. It forgives the insolence for the sake of the courage, and the harshness for love of the sincerity. Mr Brown, moreover, has a clear head for detecting a sophism, and a knack of getting at the gist of a dispute, though it may be swathed about in redundancies and circumlocutions. He clenches an argument with homely common sense, and drives a truth into the mind of an antagonist with as much force and as little ceremony as a carpenter drives a nail into a block. He is a man, to use a very common phrase, who will 'stand no nonsense,' and would rather a thousand times be thought rude, boorish, and disagreeable (which he very generally is), than call a spade other than a spade, compromise an opinion, or abandon a prejudice that he had once defended.

In every condition of life, in the very extremity of distress and poverty, a man may be upright, and will be the better for it; but to be downright is not over-prudent in him who has his fortune to make, or any worldly advantages to expect from his fellows. If a man be rich, his downrightiness is not much in his way. It may even become ornamental to him, and pass for caustic wit and interesting eccentricity. The worst that will be said of him is, that his ill-nature is extremely piquant and original. If he be poor, it will receive no such honourable appreciation, but be universally condemned as unjustifiable misanthropy. It is rather a dangerous weapon in any one's hands, but doubly dangerous in the grasp of those who have not high birth or station, or the right of rich revenues, to privilege them to wield it.

Mr Jones, the straightforward man, has the candour of the downright man without his incivility. He uses clear and intelligible language on all occasions, but does not hold himself bound to select the harshest phrases which can be found. Integrity also belongs to his character; but, being more conspicuously marked by straightforwardness, no one thinks of speaking of his uprightness. The notable points in the straightforward man are the directness and openness with which he acts in his intercourse with the world. He takes the broad highway, and not the crooked path. His objects may partake of the usual business character of selfishness, but he does not make them worse by attempts to disguise them. No; he says, I am here a man of business,

and pursue my interests, leaving others to do so too, as they have a right to do. Thus everybody knows at once 'what he would be at,' and arrangements are made and bargains struck with half the trouble which they would cost in other hands. Sometimes this straightforwardness is felt as a little out of taste; but all are sensible of its being extremely convenient, and generally acknowledge in the long-run that Mr Jones's mode of doing business is the best. It is amusing to see a quirky or circumbient man come into dealings with Mr Jones. He is apt to be confounded by the very transparency of the other's mind. It puts him out. He could manage admirably with one who took cunning ways too, however much he might be upon his guard; but straightforwardness is a new mode of fence, and he sinks under it. It is the same way with the sophist, and the man who has a bad cause to defend by clever arguments. The arrow-flight directness of Mr Jones's common sense overthrows him at the first encounter.

Straightforwardness is not always combined with wisdom; but when it is, it becomes a masterful power. Even by itself it can hardly fail to elevate its possessor in the esteem of mankind. As a rogue is defined to be 'a fool with a circumbendibus,' so may one who has no bad designs and no circumbendibus about him be said to possess a kind of wisdom. In Don Quixote, we see straightforwardness united with hallucinations; and it is interesting to reflect how that one good quality—the good faith, simplicity, and thorough honesty of the poor hidalgo—makes him respectable amidst all his absurdities. Generally, however, the straightforward man is no fool, but one in whom all the elements are well combined, with a keen eye, a clear head, a good heart, a passionate love of truth, and an unflinching determination to pursue it.

We trust, as the world gets older, upright and straightforward men will increase amongst us, and downright men become more scarce. The first qualities are unquestionably virtues; but the last is at the best an unpleasant characteristic. Downright men do not see things quite in their true light. They are oddities in our social scene. The soft words which they deprecate, and which they never will consent to use, what are they but the result of an improved civilisation? In a ruder age, when bad actions were more frequent and of a grosser nature than now, it would have been cowardice and baseness in any who could see the evil to speak of it mildly. But now, when a tolerably equable standard of good conduct exists in all classes aiming at being called respectable, and when a vast tribunal instantly condemns any occasional aberration, softer terms are sufficient; and merely to express surprise at any little delinquency, conveys, in these days, a severer reproof than would have been borne two hundred years ago by a violent public declamation.

SUPERSTITIONS AND CUSTOMS OF TOURNAINE.

[The following article has been prepared at our request by an English gentleman who has lived several years in Tournaine, and acquired a thorough knowledge of the manners and customs of the people. Our object was to ascertain in what degree the popular fancies and habits of that province in central France resembled those of our own country, as detailed in Ellis's edition of Brand's *Antiquities*, and outlined three years ago in a series of papers in this Journal, entitled 'English Popular Festivals.' We trust, therefore, that the present paper will be found to possess a value beyond that arising from its power of amusing a passing hour.]

LIKE the fossils in the strata of the earth, marking the several epochs in which families of living beings have had their existence, the superstitions and customs which prevail in the rural districts and communes of Tournaine mark the various periods when the Druid, the Roman, and the Frank, were lords of the soil. Time has not worn out, nor the mingling of various races obliterated

the strong impress left by religious creeds and observances which have been long lost in the oblivion of centuries gone by, since they were the rule and guide of those who were then lords of the soil, and formed the population of ancient Gaul. The observation of the 1st of January, in nearly all the communes of the arrondissement of Loches, is evidently a Druidical ceremony. It is called *Aguillauneu*, or *Aguillonés*. All the peasants, and more particularly the younger ones, on that day go from house to house wishing their neighbours a happy New-Year, and crying for *les aguillauneu*, or *aguillonés*, upon which they generally receive some small present. In the towns, 'les étrennes' are given and received; but in the country, the *aguillauneu* has descended from the time when the Druids cut the sacred gey, or mistletoe from the oak, which was done with a golden knife, and the plant received in a white linen sheet, and distributed to the people, crying 'à guy l'an neuf,' whence the word *aguillauneu*. This plant was considered as a specific against various diseases and infirmities, as epilepsy, sterility, poisons, &c. and is still held in high estimation, more particularly when cut from the oak. There is, however, strong reason to believe that what is found as a parasite upon that tree is not the common mistletoe, but an allied plant (perhaps *Loranthus Europæus*, which is abundant on the oak in some parts of Europe, and much resembles the common mistletoe). *La Bis Bergère*, another ancient fête, is held on quinquagesima Sunday, *Le Dimanche Gras*: all the shepherds of each hamlet assemble, when the weather will permit, in the open air after vespers, each bringing with him provisions of bread, wine, bacon, and, above all, eggs, the frying of which is an essential part of the ceremony. All the domestics and young people from the neighbouring farms attend, and great part of the night is spent in songs and dances.

Le Dimanche des Brandons.—On the evening of the first Sunday in Lent, as soon as it grows dark, all the lads and lasses of the neighbourhood spread themselves over the fields sown with corn, with a flaming torch or brandon in their hands. In Berri they carry poles, on the tops of which are bundles of flaming straw; in some places the torch is made of the dried stems of the mullein, covered with tar. The object of their search is the 'nielle,' or corn cockle, which they consider as very injurious to the crop. The search continues about an hour, after which they repair to the respective farms, where a feast is prepared, one of the chief dainties of which consists of 'pancakes,' which are distributed to the young people in proportion to the quantity of nielle they have collected. This fête is considered the same as that celebrated amongst the ancients in honour of Cybele or Ceres, the first teacher of husbandry.

Christmas Eve.—On the night preceding Christmas Day, the largest log which can be found is placed on the hearth; this is called 'Le Souche de No,' or 'Ferefeu.' The head of the family then mounts on the block, and cries three times with a loud voice, 'No, no, no, que ce jour est serio par le bon Dieu et la bonne Vierge, le ferefeu est au feu; on se mit à genoux.' They then say a paternoster and an ave, and sing carols till it is time to attend the midnight mass; but, before the family departs, food is given to the cattle, after which great care is taken that no one goes near the stable till the mass is concluded; for on this night the beasts are able to converse, and wo be to him who listens to their conversation. A terrible tale of the punishment inflicted on a listener has descended from generation to generation, and is fully credited by the peasantry of the district. The master of a house, once upon a time, had great

curiosity to know what his oxen had to say, and to that purpose hid himself in the stable. As soon as midnight sounded, he heard one of the oxen say to another in a very terrible voice, 'What shall we do to-morrow?' 'Drag our master to his grave,' bellowed his companion. A horrible shudder passed through the frame of the terrified farmer, who was scarcely able to crawl to his bed, where he very soon expired, and was buried according to the prediction. This dreadful example has effectually prevented any listeners ever since. As to the fire which has been kindled, it is not so much for the purpose of warming the family when they return from church—for every one attends the mass, except the sick and aged who are confined to their beds—but during their absence the Virgin is supposed to come and warm herself, to spin, or swathe the infant Jesus. The block or 'souche de no' continues to burn during the three fetes of Christmas, after which the ashes are collected, and pieces of charcoal suspended from the ceiling, and over the bed; the remainder is carefully preserved as a very fine thing for cows when they calve, to whom the powder is administered mingled with their drink.

Le Gâteau des Rois, or Twelfth-Night Cake.—The master of the family cuts up the cake, which is an enormous flat piece of pie-crust, and in which a bean is concealed: he then places the youngest child upon the table, addressing her by the name of 'Phoebe.' She replies by the word 'Domine,' and he then asks to which of the party such and such a morsel of the cake shall be given. The child names each guest without distinction of rank or precedence, all the domestics being present; in whosever's portion the bean is found, the holder becomes king for the night, and the revels take place after the manner of the Roman Saturnalia, to which nation the use of the words 'Phoebe' and 'Domine' evidently refers the manner of the celebration.

La Joinee.—On the eve of St John, June 24, in every village and hamlet, and in the faubourgs of every town, in the department of Indre et Loire, fires are kindled at night, which are called *La Joinee*, or *Johannee*. As soon as it grows dark, men, women, and children assemble, and the fire is kindled by the oldest or principal person, who marches at the head of the party thrice round the flaming pile, praying aloud; when the wood previously provided is nearly consumed, branches of juniper and other aromatic plants are thrown on the heap, and a thick smoke produced, when all the cattle in the neighbourhood are brought forth and driven thrice round the fire, after which the young people dance rondes, singing and shouting until midnight; and any one who rises before daybreak, and searches carefully amongst the ashes, will, it is said, find some of St John's hair. The ashes themselves are thought to possess various peculiar and marvellous properties.

Fairies.—The belief in these spirits is much the same as in other lands; they are considered as heavenly beings, dwarf in size, living in caves during the day, or in clefts of rocks, and particularly near solitary fountains, where they wash their robes very frequently: they are considered as generally well-disposed; but sometimes ride horses during the night, and tie knots in their manes to form stirrups, leaving the horse gear in great disorder. They are fond of moonlight dances, and you may easily trace the place of their assembly by the dark rings in the grass. My informants all agree that they are by no means so common as in former times; and some assure me, that they have understood that about 800 years ago the greater number of these spirits were driven from France into a very distant country, the name of which they did not know, but that they were doomed to remain in banishment 1000 years; so that in two centuries more they will return to their former haunts. In the fosse of the chateau at Loches are two pillars which supported a drawbridge, erected to facilitate the evasion of Mary of Medicis from the pursuit of Cardinal Richelieu: these are shown as the work of fairy hands, and said to have been erected in one night. One species of

fairy, called '*La Bête Havette*,' is of rather a malignant description: she lives in wells and fountains, and is very fond of children, sometimes pulling them into the water and drowning them.

La Milloraine, or Demoiselle, is a white phantom, chiefly seen in Normandy, of enormous size, appearing in lonely places, but with no distinct form or features; grows larger and larger as you approach nearer; but when you arrive at the precise spot, she vanishes over the trees, making a noise like a hurricane amongst the leaves. Another species of goblin haunts houses, and plays very troublesome and mischievous tricks, knocking at the doors, or on empty casks, moving the furniture, whispering words, heard indistinctly, sighing, groaning, and pulling off the bed-clothes, making ugly faces at the children, &c. One in particular is very obnoxious, and is called '*La Bête de St Germain*.' Apparitions of black rams vomiting flames, black cats with eyes of fire, red bulls with enormous horns, and black dogs which stand immovable where treasure lies buried, are by no means rare; but, above all, white rabbits are very dangerous at night.

Le Chasse del Chien, or St Hubert's Hunt, is frequently heard in the air at night, and consists of the barking of dogs, rattling of chains, and doleful cries, supposed to proceed from demons who are carrying away condemned souls to a place of punishment: this is also called '*Le Chasse Briquet*,' or '*Chasse à Ribaud*;' and there are very few peasants who have not heard it—proceeding, no doubt, from flocks of wild geese or other migratory birds.

Sorciers.—Tales of sorcerers are very common, and of the grand assemblies they have been seen to hold. Many of these histories probably arose from the meetings of the Huguenots and other persecuted sectaries in former times. They are now considered as a very evil race, and are said to anoint themselves with the fat of unbaptised babies before they attend their grand assemblies. Magicians differ considerably from sorcerers, and do not go to these abominable meetings; they are the masters, and not the servants of the devil. They have great power over men and animals, causing madness in the former, and various diseases in the latter; dry up cows' milk, and make horses restive and inclined to run away. They are frequently known to throw a powder into the air at fairs and markets, which drives the beasts wild, and causes a great commotion. They also stop vehicles on the highway, put out fires, make philtres, and have the power of rendering themselves invisible, or taking the forms of divers animals. Their secrets are written in a book called '*Grimoire*,' and much studied by Italians, Jews, a people called philosophers, and by a good many priests. No one is more to be feared in a canton: their power extends over the health of man and beast: any one who displeases them is attacked by a disease of which he languishes and dies: sometimes the enchantment is confined to the cattle, and the whole stock upon a farm perishes. The curés in the country, by means of their '*Grimoire*,' have great power over storms, and can, if they will, direct them away from their own parish, preserving the crops from hail and other accidents; but if they are angry, and their will is not obeyed, they are able to lay waste the whole district. Not long ago a terrible storm devastated the arrondissement of Loches, on which occasion two priests, whose names are well known in the district, were seen on the borders of a pond at Louroux; one, carrying his '*Grimoire*' in his hand, seated himself near the edge of the water, which the other beat with his staff till it arose in the form of a trumpet, and caused the hail which devastated the lands. Several persons vouched for the truth of this tale, in which they evidently fully believed.

In many of the cottages you will find two things suspended from the ceiling; namely, a plant of house-leek (*sempervivum tectorum*), which shows, by immediately withering away, when a sorcerer enters the house; and on the arrival of a stranger, an anxious eye is often

turned to the house-leek. The other is a small loaf (pain de Noël), which is made and baked on Christmas night, and possesses the singular property of curing mad dogs; a morsel also taken every day is very good for the health. Small cakes made on the eve of all the grand fêtes, and baked under the ashes, have the virtue of saving the soul from purgatory, and are called 'sauve ame.' Also behind the door you will generally find a branch of box, which was blessed on Palm Sunday, and which has the property of protecting the house from lightning and from fire. Sometimes every room is thus protected; and in case of a violent storm, the master or mistress of the house has recourse to the 'buis beni,' dips it in holy water, sprinkling the room and all the parties present, after which they all kneel in prayer. Fortune-tellers and gipsies find out thieves and stolen goods, and are believed to read futurity by chiromancy and cards; a belief by no means extraordinary amongst the peasants, when we consider the large fortune accumulated by Mademoiselle Lenormand through the credulity of the highest ranks in Paris.

Hidden Treasure.—It is universally believed, that during the various civil wars and revolutions which have desolated France, vast treasures have been buried or concealed in caves and ruins. The peasantry of Touraine believe that these hoards of wealth are guarded by black dogs, which, if they come to your house, and are well-treated, will sometimes guide you to the spot where they are deposited. To obtain them, you must fast for some days, and then dig a trench about the place, so as to turn up a large mass of soil, without which precaution the devil, to whom all these treasures belong, will carry it off. Having begun your work, you must on no account desist till it is completed; and as the first living creature which raises the treasure will die within the year, you should provide yourself with an old horse of no value, who will then become the property of the devil instead of the treasure you have gained. In a valley in the forest of Loches are the remains of a house built by Charles VII., as a 'rendezvous de chasse' for himself and his court; beneath it is a cave, in which a prodigious treasure is deposited, guarded by a dragon, which I am assured any one may see if he has the courage to visit the spot at midnight quite alone, the animal then lying at the entrance of the cave, and guarding the treasure in a wicker basket. This valley is called 'Or Sous,' and the name perhaps gives rise to the tale. No one has ever ventured to test the truth of this universally-believed legend.

Charms and Amulets.—Throughout the arrondissement, and particularly in the faubourgs of Loches, if an infant is seized with convulsions, either from dentition or worms, it is said to have 'Le mal d'Exive.' Physicians are in vain; and a journey to Exive is the only remedy. This place, on the banks of the Cher, near Montrichard, possesses a holy spring, whence its ancient name Aigue Vive, or Aque Vivæ. Probably its sanctity is of Druidical origin, and was afterwards preserved by an abbey of the order of St Augustin, founded on the spot; but the abbey is now in ruins, and the curé of Montrichard directs the necessary rites and observances, and receives the fees, which are not inconsiderable, and formerly were part of the revenue of the abbey. During the prevalence of any epidemic or contagious disease, a well-known preventive is to take the young shoots of a fig-tree and cut them into pieces about half an inch long; these are strung in the manner of a chaplet, and taken to a priest, who says certain prayers over them, gives them his blessing, and places them in contact with a statue of St Rock, after which the person wears them for nine days, during which prayers should be said for him, and he is safe from the disease, or speedily cured in case of an attack from it.

Many married women wear two amulets to procure them safety during childbirth, the one called a 'crapaudine,' which consists of a ring worn round the neck or on the finger, which has set in it a crapaudine, or petrified tooth of a shark; the other is a ribbon of

white silk, which has touched the veritable ceinture of the blessed Virgin, and is precisely of the same length, namely, two metres five centimetres. Upon it are printed these words—'Mesure de la veritable ceinture de la très Saint Vierge, conservée dans l'Eglise du chateau royal de Loches, à moi N...., servante de Dieu je vous salue Marie.' This ribbon is first worn by young girls when they make their first communion, and again on their wedding-day; some wear it under their garments all their lives. The girdle itself was given to the church of Loches by Geoffrey Grise Gonelle, Count of Anjou, who was living in 958, and received it as a present from a queen of France. It was originally brought from Constantinople by Lothaire.

On a death taking place in a house, the water in the bucket, any wine or liquid in the drinking vessels, is immediately thrown out, lest the soul of the departed should receive any damage by falling into them. If it is the master of the house who is dead, some one runs immediately to the bee-hives, knocks gently on each, and says, 'My little friends, be quiet; you have lost your master, but do not leave us; we will take the same care of you, and be kind to you.' They also attach a morsel of black stuff to each hive, that they may wear mourning like the rest of the family. It is also considered as a well-known fact, that if the master of the house is violent, and swears or quarrels, the bees never thrive so well as in a family which lives in concord and harmony. It is also considered very wrong to count the number of hives; and in purchasing bees, it is particularly necessary that the money be very honestly gained, or the bees will never thrive; whence it is not uncommon to say of any sum gained with considerable labour—'Ho! cet argent est bien bon pour acheter des abeilles.'

Les Coquards, or cocks' eggs.—The dwarf eggs laid by hens are believed to be produced by the cock, particularly by old cocks; and if submitted to incubation, and allowed to be hatched, they produce that very formidable animal called a basilisk, which is a species of winged dragon, whose eyes by a single glance are able to destroy the unfortunate person who comes within their influence: if, however, a man is able to fix his eye first upon the basilisk, the latter dies immediately. The same superstition prevails in Bretagne, where I was shown a well in which I was told there existed not long ago a crocodile which possessed the same destructive powers as the basilisk of Touraine, but which was at length fortunately destroyed by the powerful eye of some beholder, who was beforehand with the dreadful animal.

Les Loups Garous, or men who for some time have been excommunicated—or misers who have sold themselves to the Evil One, and are compelled to assume the shape of wolves, though an article of faith, are not supposed to exist at present in Touraine, wolves themselves being rare; but a belief in 'Brous' is nearly universal, and I was referred to those who had been witnesses of their existence.

Les Brous probably derive their name from the old Armorican 'brous,' a thicket, because these creatures are supposed to gallop all night over the forests and thickets. I received the following testimony from men who were not particularly credulous in other matters:—Joseph Guebin, a small landholder and jobber in cattle, who has no fear of ghosts or fairies, sorcerers or magicians, knows two brous, who have been in the habit of scouring the country at night; they are near neighbours of his at Ferrière Larcen. One is a mason about sixty years of age, who was long suspected of being a brou, from the circumstance of his never being at home at night; and after his day's work, of course he would not have spent his time in racing over the forest, had he not been a decided brou; which was at length clearly proved by a neighbour of the present writer, who was returning late at night from the market at Ligeuil, when he found a very beautiful sheep on the route. Thinking it had strayed from some flock in the vicinity, he took it on

his shoulders, carried it home, and locked it up in the stable with his donkey; when, next morning, on opening the stable door, the sheep had vanished, and in its place was the mason in the act of placing some straw in his sabote: of course he was a brou; and the reason was, that in his youth he had been a thief and a very wild young man. The second instance was a young man, who, having stolen some cloth, became a brou, and ran over the country at night, killing and devouring dogs, poultry, and other animals; but he afterwards confessed himself to a priest, was absolved, and never galloped again. The writer has frequently seen the remains of dogs which have been destroyed and half devoured by brous, especially their paws.

Louis Manceau, a merchant of cattle, about thirty-six years of age, and by no means *bête* in general affairs, an inhabitant of the town of Loches, and accustomed to travel over the country in his vocation, informed me that he had seen and known several brous, but that they are not so numerous as they were some few years ago, because the priests are forbidden to act as they used to do. Some fifteen years ago, if you were robbed, you went to a priest and gave him a louis-d'or, for which he read some prayers out of a book, and then placed two loaves of bread upon the altar, which, after a short time, became quite black; and if the person who had stolen the property did not restore it, he was destined to become a brou, and to gallop the country from the time the angelus sounded in the evening till it rang again in the morning. The curé of La Selle, in the commune of Ligeuil, was very celebrated for making brous, till the priests were forbidden such practices.

A young man, named Charles Robin, a small farmer, assured me that a few years ago, on going into his garden one fine moonlight night, he saw a small sheep walking slowly up one of the paths, and on attempting to lay hold of it, it bounded over a high wall, and ran off to the forest, uttering the most unearthly shouts of laughter. He called his uncle, who was in the house, and who ran into the garden, and also heard the laughing, which was quite supernatural. The uncle confirmed this statement; and, moreover, informed me that he knows a woman whose husband was suspected of being a brou, and of galloping the country at night. In order to detect him, she took a needle and thread to bed with her, and sewed his shirt to her chemise. The neighbours saw him gallop, notwithstanding something still remained in bed with the wife, either a lifeless body, or something which had taken the form of the suspected person. Sometimes this credulity has had very fatal effects. Some twelve years ago a man was shot at St Hippolyte, near Loches, by one of his neighbours, and killed upon the spot, upon suspicion of being a brou, and his family was so persecuted that they left the village, and took up their residence at Loches, where they still remain.

There are also female brous. A domestic residing in a family at Loches declares that she knows a married female with a family, in the village of Liege, who galloped in the form of a sheep also, and was found by a man passing along the road to St Quentin late at night, who took the animal on his shoulders, and soon after found the weight of his burden very much increased; and when he got near his own door, was astonished at the sheep asking in a human voice where he was carrying her. He was dreadfully alarmed, and threw down his load, which instantly became a woman, and fled away, leaping prodigiously high, and uttering loud laughter. This same informant has often heard the *chasse à briquet*, and believes it to be caused by hunting in the air. Certainly it is not from birds; for you may distinctly hear the barking, for all the world like a common dog. She also knows that if a coquard is hatched, it will produce a basilisk; and one of her relatives lost several children by the *mal d'Exive*.

There are also many other superstitions existing in the department, and preesses believed in, some of which are common to many other countries. For instance,

the aurora borealis is considered a sign of war and tumults. White moons in July and August are signs of evil. The sun is believed to dance three times on the horizon when he rises on St John's day. The screaming of owls forebodes death. A branch of sweet-brier suspended over the door of a house protects the inmates from fever.

Some babies, as soon as they are born, run about the house, get under the bed, and make horrible grimaces at the persons present: it is necessary to drive away such unnatural monsters with pitchforks. On no account wash your linen '*entre les deux chasses*;' that is to say, on the eight days between the Fête Dieu and the day of its octave, when '*les chasses*,' containing the relics of various saints, are carried from Loches to the adjoining town of Beaulieu, and from Beaulieu to Loches; if you neglect this, you are sure to wash your winding-sheet. Take care not to bake on rogation days, otherwise your bread will be bad all the year. Never spin on the Thursday or Friday in holy week, or your cows will have '*le fourchet*;' that is, an ulcer between their hoofs, which lames them. If you wish for good success in rearing poultry, you should dance on the dunghill in the farmyard on Shrove Tuesday. After the corn is sown, you must abstain from eating toasted bread, or you will have a bad harvest. It is very dangerous to hear the cuckoo for the first time fasting, and invariably brings fever. The moths which fly to the candles at night are the wandering souls of the dead; take great care that they do not burn themselves. Many persons, when they take their meals, leave a small portion of meat on their plate for the Evil One. This sort of offering renders him less malicious: there is no knowing what may happen—'*il est bon d'avoir des amis partout*.' Crickets bring good luck to a house, and must not be disturbed. '*La chère-année*,' or cockroach, is an insect of bad omen, and forebodes a bad harvest and dear bread; hence its name. The cobwebs floating in the air in August are produced by the holy Virgin, who is then spinning robes for the angels. Great care is requisite in placing a bedstead so that it be parallel with the beams of the chamber; if placed at right angles, it will cause serious evils to the person who sleeps on it. Never begin a journey on a Friday; some mischief will befall you if you neglect this precaution. If a hare crosses your path, your journey will be unfortunate. Marriages made on Friday are sure to be unlucky: Monday and Tuesday are the most propitious days. Thirteen at table a fatal number: spilling the salt, or crossing your knife and fork, to be carefully avoided. If you see a woman with her head bare in the morning, some misfortune will happen during the day. Small spiders spin small sums of money, large ones bring more considerable profit. A spark flying from the chimney preesses a visit from a stranger. If, at washing-time, the chaldron be left empty, it is a sign of death in the family. A magpie scattering the horse-dung in the road, shows that a funeral will soon pass the spot. The wren is a sacred bird, in consequence of her having brought fire from heaven; in doing which she burnt her feathers, on which accident all the other birds gave her one, except the owl, who on that account is hooted whenever he is seen. If you eat an egg, be sure to crush the shell, for fear some enemy should fill it with dew, and stick it upon a white thorn; for as the sun dries up the dew, the person who has eaten the egg dries up and dies also.

Similar superstitions exist in other provinces. In Normandy, for example, they tell that a gentleman living near the embouchure of the Saire had a son who was a monk. A farmer came one day to pay his rent, and not finding the father at home, gave the money to the son, who afterwards denied the fact, and wished, if he had taken it, the devil might carry him into the sea; which took place immediately. The monk, however, was not drowned, but is often heard screaming near the shore, and has been seen in his monk's frock and cowl; indeed one man played at cards with him one fine night, and lost every sou he possessed.

At Gildo, on the coast of Bretagne, the ghosts of those who have been drowned in crossing the ferry scream dreadfully before bad weather. At the fountain of Bodilis, in Finisterra, lovers try the virtue of their mistresses by floating a pin taken from their corset: fortunately, in that primitive district the ladies fasten their attire with sharpened pieces of wood. In the department of Loire Inferieure, an enormous phantom, called Louis Courtois, is believed to pass over the heaths at night, uttering direful cries, which cause the death of the hearers. A grain of consecrated wheat is believed, in Bretagne, to be a certain cure for sore eyes.

A LECTURE BY MR FARADAY AT THE ROYAL INSTITUTION.

ALTHOUGH the dweller in the monster city—smoky, foggy London—labours under many disadvantages as to sources of recreation, when compared with the pure open-air enjoyments of the inhabitant of the country, he yet possesses many advantages to which the provincial is a stranger; and these are found in the numerous scientific institutions which London, notwithstanding her noise, bustle, and mercantile abstraction, encourages and supports. One of the first, if not the most important, is the Royal Institution of Great Britain in Albemarle Street, founded in the year 1800, 'for diffusing the knowledge, and facilitating the general introduction of useful mechanical inventions and improvements, and for teaching, by courses of philosophical lectures and experiments, the application of science to the common purposes of life.' How far this promise of the prospectus has been carried out, may be judged of by the eminent support which the institution receives, and by the numerous audiences which crowd the theatre at the weekly lectures; the privilege of hearing which, with the other advantages presented by the establishment, being secured by an annual subscription of two guineas. A reference to some of the names connected with the history of the institution will be sufficient to show the high character of the advantages offered by it. We find at the earlier period those of Count Rumford, Sir Joseph Banks, the Duke of Bridgewater, and Sir Humphry Davy, followed by the present professors Brande and Faraday, who ably sustain the distinction earned by their predecessors. The latter, as is well known, originally a bookbinder, was appointed as one of Davy's assistants in the laboratory of the institution, and now, by the force of genius, the servant succeeds the master, and ranks among the first of modern chemists.

A few weeks since, the writer of the present article had the pleasure of hearing him deliver a highly interesting lecture on the Liquefaction and Solidification of Substances usually considered Gaseous, a subject which, for a long period, has occupied the attention of scientific men, who have considered that the origin or basis of gases, the lightest known substances, would be found in solid matter, although, with few exceptions, the attempts made to solidify them have proved unsuccessful. Mr Faraday commenced his lecture by stating that he had been constantly engaged in researches on this subject for six months; and traced briefly the history of the labours of other philosophers.

The first trials were made in 1761 by John Canton, who succeeded in compressing, with the force of two or three atmospheres, the air in which a thermometer filled with water, and open at one end, was introduced. The investigations were afterwards continued by Perkins, and Oersted of Copenhagen; and still later, the French Academy awarded a prize to Messieurs Sturm and Colladon for their researches. Subsequent to these were the experiments of M. Aimé, who caused the gases to be sunk to a great depth in the sea, thinking to solidify them by the enormous pressure. But as it was impossible to see the gases while in this state of compression, and as they were exposed only to ordinary temperatures, the results could be of no value or authority. M. Cagniard-Latour, in his experiments upon ether, discovered

that, at a certain temperature, liquids are transformed into vapour without any diminution of volume; and Thilorier found that a very low temperature could be obtained by employing a bath of carbonic acid combined with ether: but an unfortunate explosion, by which several persons were killed, interrupted his researches; he, however, employed his bath only in the ordinary temperature, while Mr Faraday, as will be seen, used it *in vacuo*.

The lecturer then went on to observe, that he had investigated the subject in a strictly philosophical point of view, aiming at certain effects by philosophical induction and research, of which, as a striking example, he adduced the safety-lamp of his predecessor Davy. He then read an extract from a letter written by Professor Liebig, in which that celebrated philosopher observed, that Germany and England pursued opposite courses with regard to science; in the latter, the practical was too much thought of, while, in the former, the theoretical and philosophical were alone considered as worthy attention; but that, in his opinion, the golden mean would be the wiser course for both countries. Mr Faraday next observed, that the failure of the experiments of so many eminent chemists in the solidification of gases, arose from the attempts having been made under ordinary temperatures; but if the point of liquefaction be, as it appears to be, in the lowest degree possible with the lightest and most volatile bodies existing as gases, there would be scarcely any hope of liquefying such substances as hydrogen, oxygen, or azote at any pressure while in an ordinary temperature, or even of a temperature very much below the ordinary. These observations furnish the key to the whole of the lecturer's method of operating. He brought forward a cylindrical vessel of iron, about two feet in length and a few inches in diameter, fitted with a moveable tube, and a stop-cock at the upper end: in this carbonic acid gas was condensed in the form of water. On turning the cock, this liquid rushed out with so great a velocity through the tube into a close round box, that farther condensation was produced; and, on opening the box, the gas appeared in the beautiful form of snow. This was taken out, and the box refilled, until a sufficient quantity was obtained, when the whole was deposited in a glass jar, and preserved from evaporation by being placed within other jars, protected by numerous folds of flannel. From this store of freezing power several lumps were taken and placed in a shallow saucer, for the purpose of making the 'cold bath.' Although sufficiently cold to freeze mercury, they were taken in the hand without inconvenience, owing to the rapid evaporation which forms a stratum of gas between the solid mass and the hand. Something is yet required to produce contact without affecting the low temperature. This is effected by moistening the lumps with ether, after which it would be dangerous to touch them with the finger, as vitality would be as certainly destroyed as by the most intense heat. A small quantity of mercury was then poured into the bath, where it became immediately frozen, and was lifted out, hanging to a wire, in a perfectly solid state. This low degree of cold was, however, not yet low enough to produce the solidification of the gases, and the lecturer explained his further process by a very simple illustration: he took a kettle of water, which was brought in boiling at the commencement of the lecture, but which, for half an hour, had been standing on the floor, and poured a small quantity into a flask, when, on being placed under the exhausted receiver of the air-pump, it boiled violently, proving that the diminution of the pressure had the effect of extracting the heat from the water; a fact which was confirmed by pouring a few drops of the contents of the flask and of the kettle respectively over a piece of phosphorus: with the former, this inflammable substance was not affected, but the heat yet remaining in the latter set it immediately on fire. The same process was gone through with the carbonic acid bath. On being placed under the receiver, and the air exhausted, the ebullition was as violent as

with the warm water in the former experiment: the result was a degree of cold of which we can form but little conception, being equivalent in some instances to a hundred degrees below zero. But cold of itself is not the only agent required; there must be pressure; and it became of importance to find a material which would show the results, and at the same time bear a pressure varying from twenty to two hundred atmospheres. Flint-glass tubes were tried, but proved to be unfit for the purpose, as they flew into atoms under a comparatively slight degree of compression: tubes of green or bottle glass were then thought of, and found to answer admirably; and such was Mr Faraday's satisfaction with the service he had obtained from them, that he dwelt at some length upon the qualities and properties of various kinds of glass. He made use of these tubes fitted with stop-cocks, and in some cases connected with small tubes of copper in such a manner, that with two condensing pumps, the gas which was the subject of experiment could be forced into them, and compressed with the requisite power, and at the same time exposed to the intense cold obtained under the receiver, where the effects of the compression could be seen. The low temperature, and the pressure together, produce effects which remain undeveloped under a single influence. To these combined powers is Mr Faraday indebted for the important results he has already obtained, as shown by the following specification:—

Olefant gas, when condensed, appears as a beautifully transparent, colourless liquid: it is not solidified; and will dissolve oily, resinous, and bituminous bodies. Pure hydriodic acid may be obtained either in a solid or liquid state. When solid, it is very clear, colourless, and transparent, generally traversed by fissures through the whole mass, which bears great resemblance to common ice. Hydrobromic acid can also be obtained as a clear and transparent solid body, or as a limpid and colourless liquid. Fluosilicic acid has been condensed to the liquid state; but in this experiment it was found necessary to perform the operation at the very lowest temperature: the result is extremely fluid, and as easily disturbed as warm ether. No positive effect has yet been witnessed with phosphoretted hydrogen and fluoboric acid; both have, however, presented some results of solidification. Hydrochloric acid liquefies readily at a pressure of one atmosphere, but does not solidify; sulphurous acid, on the contrary, becomes immediately solid, as might be expected. Sulphuretted hydrogen appears as a white, transparent, crystalline mass, resembling congealed nitrate of ammonia or camphor. Euchlorine shows itself as a reddish orange crystal, very friable, but presenting no indications of explosive power. The protoxide of azote had been made the subject of experiment in France by M. Natterer, who obtained it in the liquid state. It now solidified in the cold bath, but evaporated rapidly, producing so low a degree of cold, that on placing the vase containing it in the bath of carbonic acid, the latter, in which mercury froze instantaneously, operated as a heated liquid, and caused the protoxide of azote to boil violently: in the solid state, it is crystalline and colourless. Cyanogen and ammonia pass into the solid state: the latter, when pure and dry, forms a substance similar to that produced from sulphuretted hydrogen. Arseniuretted hydrogen and chlorine become liquid; but have hitherto baffled all attempts to solidify them. Alcohol submitted to the pressure, presents the thick appearance of cold oil, but does not solidify: the same result is seen in caoutchine, camphine, and oil of turpentine, which all become extremely viscous. The binoxide of azote, and the oxide of carbon, offer no sign of liquefaction, even with the lowest temperature which it was possible to produce, and with a pressure of thirty to thirty-five atmospheres. Carbonic acid, in passing from the liquid to the solid state, and prevented from dispersing itself as snow, forms a beautiful substance, whose transparency is such, that for some time the operator was uncertain if the

tube were full or empty, and was obliged to melt one end in order to assure himself of the fact.

Many results have been obtained relative to the point of fusion of these various gases, and their tension under certain degrees of temperature. The gas prepared for the evening's experiment was olefant, contained in a glass vessel connected by a tube with a condensing pump of one-inch bore; this, in turn, communicated with a smaller pump of half an inch bore, from which the gas was driven along a metallic tube to the glass tube in the receiver of the air-pump, where, after a few strokes of the pumps, it was distinctly visible, compressed in the form of liquid. The lecturer concluded, amid well-earned plaudits, by observing that he had hoped to make oxygen the subject of the experiment, but from some as yet undetected cause, it had baffled his attempts at solidification; possibly some oversight in the manipulation. He had, however, great reason to believe, from certain indications which he had met with, that his efforts would be eventually successful in solidifying not only oxygen, but azote and hydrogen. He is inclined to believe, with M. Dumas of Paris, that the latter will show itself in a metallic form. Time and experience will determine whether these views are correct—whether the lightest and most volatile of all known bodies be in its origin akin to the most dense and heavy.

Not the least charm of Mr Faraday's lectures is his agreeable manner and ready and easy utterance. He is a perfect master of his subject, and seizes on illustrative examples with happy facility; and as his experiments always succeed, his audience is not wearied with idle delays. In listening to him, the writer recognised the truth, that the best lecturers are always the simplest; they make no display of turgid or mysterious phraseology, but appeal directly to the reason and common sense of their hearers.

ADVERTISEMENTS OF THE TIMES.

In the whole range of periodical literature, there is no greater curiosity than the columns daily devoted to advertisements in the Times newspaper. From those ponderous pages the future historian will be able to glean ample and correct information relative to the social habits, wants, and peculiarities of this empire. How we travel, by land or sea—how we live, and move, and have our being—is fully set forth in the different announcements which appear in a single copy of that journal. The means of gratifying the most boundless desires, or the most fastidious taste, are placed within the knowledge of any one who chooses to consult its crowded columns. Should a man wish to make an excursion to any part of the globe between Cape Horn and the North Pole, to any port in India, to Australia, to Africa, or to China, he can, by the aid of one number of the Times, make his arrangements over his breakfast. In the first column he will find which 'A. 1. fine, fast-sailing, copper-bottomed' vessel is ready to take him to any of these distant ports. Or, should his travelling aspirations be of a less extended nature, he can inform himself of the names, size, horsepower, times of starting, and fares, of numberless steamers which ply within the limits of British seas. Whether, in short, he wishes to be conveyed five miles—from London to Greenwich—or three thousand—from Liverpool to New York—information equally conclusive is afforded him.

The head of the second, or sometimes the third column, is interesting to a more extensive range of readers—namely, to the curious; for it is generally devoted to what may be called the romance of advertising. The advertisements which appear in that place are mysterious as melodramas, and puzzling as rebuses. Some of them are worded after the following fashion:—
'To CHARLES.—Be at the pastry-cook's at the corner of S— Street, at two. *Jemima* is well.—*Alice*.'

Out of such an advertisement, a novelist of ordinary tact might construct a whole plot. 'Charles' is a lover;

the course of whose love has been crossed by some inquisitive papa or guardian; he has been forbidden the house of his adored Jemima. Correspondence by post is also impracticable; so the lovers advertise one another in the Times. Happily, the lady has a confidante, to whom is intrusted the advertising department of the affair. The above is an assignation concocted by her ingenuity, and signed with her name.

Perhaps a week after, another announcement in the same column will furnish the novelist with the catastrophe. It runs thus:—

'TO THE YOUNG LADY WHO WAS LAST SEEN at the pastry-cook's at the corner of S— Street. You are implored to return home immediately, and all will be forgiven.'

The fact is, Jemima met Charles punctually, and eloped with him from the bun-shop. Her father has relented; and as no further advertisements can be detected from the same parties, it is fair to infer that their little family differences have been made up; that Charles and Jemima are married, and are as happy as they deserve to be. Occasionally, however, we find this interesting column occupied with notices which force upon us more painful inferences. A young man has defrauded his employers, and absconded; and his parents invoke him, by the initials of his name, to disclose the amount of his defalcations. In other instances, a cowardly bankrupt has run away from his creditors, and left his wife to bear the brunt of their importunities. She implores him, through the Times, to return and help her through the difficulty.

Beneath such brief tales of mystery are usually advertised articles which have been lost or stolen. These vary in style, from the coarse and mercenary offer of 'One sovereign reward,' to the delicate hint that 'If the lady who took the ermine cloak away by mistake from the Marchioness of Crampton's rout on Thursday evening will send the same to the owner, her own camlet wrapper will be returned to her.' One of the most refined of this class actually appeared in its proper place a few months since. As a superfine appeal to the susceptible sentiments of a couple of pickpockets, it has no equal in the history of advertising:—

'If the clever artists, male and female, who combined to relieve an elderly gentleman of his letter-case and purse on Friday evening last will return the former, with the papers it contained, they will oblige. The case and papers are of no use to them.'

Succeeding the 'Lost and Stolen,' it is usual to find one or two of those heart-stirring appeals to the benevolent which—despite the efforts of the Mendicity Society—have maintained many an impostor in idleness for years together. Like Puff, in Sheridan's 'Critic,' these advertisers support themselves upon their (assumed) misfortunes, by means of the proceeds of addresses 'to the charitable and humane,' or 'to those whom Providence has blessed with affluence.' The account which Puff gives of his fictitious misfortunes so little exaggerates the advertisements which appear occasionally in the Times, that we quote it. 'I suppose,' he boasts, 'never man went through such a series of calamities in the same space of time. I was five times made a bankrupt, and reduced from a state of affluence by a train of unavoidable misfortunes. Then, though a very industrious tradesman, I was twice burnt out, and lost my little all both times. I lived upon those fires a month. I soon after was confined by a most excruciating disorder, and lost the use of my limbs. That told very well; for I had the case strongly attested, and went about to collect the subscriptions myself! Afterwards, I was a close prisoner in the Marshalsea for a debt benevolently contracted to serve a friend. I was then reduced to—oh no—then I became a widow with six helpless children. Well, at last, what with bankruptcies, fires, gout, dropsies, imprisonments, and other valuable calamities, having got together a pretty handsome sum, I determined to quit a business which had always gone rather against my

conscience.' The police reports testify that pathetic advertisements, equally unfounded, find their way into the third column of the Times, despite the utmost vigilance of the clerks. Some, on the other hand, are manifestly from objects worthy both of credit and of relief. Of the latter, we select one which appeared on the 7th of February 1844, and which bears evident marks of genuineness. Addressing the sympathies of the benevolent by the borrowed aid of a popular fiction was a happy thought:—

'TO THE BROTHERS CHEERYBLE, or any who have hearts like theirs. A clergyman, who will gladly communicate his name and address, desires to introduce the case of a gentleman, equal at least to Nickleby in birth, worthy, like him, for refinement of character, even of the best descent; like him, of spotless integrity, and powerfully beloved by friends who cannot help him, but no longer, like Nickleby, sustained by the warm buoyancy of youthful blood. The widowed father of young children, he has spent his all in the struggles of an unsuccessful but honourable business, and has now for eighteen months been vainly seeking some stipendiary employment. To all who have ever known him he can refer for commendation. Being well versed in accounts, though possessed of education, talents, and experience, which would render him invaluable as a private secretary, he would accept with gratitude even a clerk's stool and daily bread. Any communication addressed to the Rev. B. C., post-office, Cambridge, will procure full particulars, ample references, and the introduction of the party, who is now in town, and ignorant of this attempt to serve him.'

The succeeding couple of columns in the first page of the Times usually display the multifarious 'wants' which an endless variety of desiderators are anxious to get satisfied. Situations by far outnumber the other wants. A governess, a gardener, an editor, a schoolmaster, a tailor, a clerk, or a shopman, who is in want of employment, seeks it through the pages of the Times newspaper. The accomplished, intellectual, honest, moral, in short, 'unexceptionable' characters, who thus paint their own portraits, give to the fourth and fifth column of the leading journal the semblance of a catalogue of spotless worthies.

Some, again, try to gain employment by eccentric appeals. Foremost among these we place the annexed little autobiography from a person who advertised himself on the 22d of last February as

'A CHARACTER.—The noblemen and gentlemen of England are respectfully informed that the advertiser is a self-taught man—a "genius." He has travelled (chiefly on foot) through the United Kingdom of Great Britain and Ireland, in Holland, Germany, Switzerland, Belgium, France, and Italy. He has conducted a popular periodical, written a work of fiction in three vols., published a system of theology, composed a drama, studied Hamlet, been a political lecturer, a preacher, a village schoolmaster, a pawnbroker, a general shopkeeper; has been acquainted with more than one founder of a sect, and is now (he thanks Providence) in good health, spirits, and character, out of debt, and living in charity with all mankind. During the remainder of his life he thinks he would feel quite at home as secretary, amanuensis, or companion to any nobleman or gentleman who will engage a once erratic but now sedate being, whose chief delight consists in seeing and making those around him cheerful and happy. Address A. Z., at Mr P—'s, B— Street, Regent's Park.'

It would appear that the self-praise thus published sometimes requires a little help; hence, besides 'undoubted ability' and 'unexceptionable references,' a *douceur* is occasionally offered 'to any one who will procure the advertiser a respectable situation.' This 'sweetener' we have known to vary from five to five thousand pounds, 'according to the emoluments.' Despite, however, all eccentricities, deception, and other evils, there can be no question that through the advertising columns of the Times many a servant has pro-

curd a good situation, and many a master has been indebted for a valuable servant. As a specimen of the appeals, the truth of which it is difficult to doubt, we print the following. The fickleness of fortune is strongly exemplified by the fact of a gentleman of 'high rank' seeking the humblest employment:—

'IT WOULD BE A NOBLE ACT OF HUMANITY if any generous and kind-hearted individual would procure or grant EMPLOYMENT to a suffering individual, in whose behalf this appeal is made. He is of high rank, education, and manners, and in every point of view fit to fill any situation. He is without influential friends, and, from complicated frauds and misfortunes, is unable to continue the education of eight lovely children. He seeks nothing for himself, except to be so placed, giving to the hands of his kind benefactor all he receives for his children's present and future support. This will save him from a broken heart. Any situation that will enable him to effect this object will be received with heartfelt gratitude, and filled with honour, assiduity, and fidelity. Most respectable reference, &c. N. B. No pecuniary assistance can be received.'

The 'want' which usually succeeds that for situations is common at some time or other of his life to every living being. The bottom of the fifth column of the Times generally contains some half-dozen announcements that X. Y. or A. B. wants MONEY. In a modern comedy, one of the characters, with a view to borrowing, tells a rich friend 'that he is terribly in want of a thousand pounds.' The other, with a comprehensive experience of the world, replies, 'I have no doubt of it; for you may take it as a rule that every man wants a thousand pounds.*' Of this vast multitude of mankind, there are, it appears, only a few superlatively sanguine individuals who hope to obtain the required cash by advertising. 'Ample security' or usurious interest is generally the bait held forth to lenders; but we are able to produce one remarkable instance in which the advertiser expresses a wish for the loan of a bagatelle of four thousand pounds without security, and which he proposes to repay, not with interest, but with gratitude:—

'A MAN OF RANK, holding a distinguished public office, moving in the highest society, and with brilliant prospects, has been suddenly called upon to pay some thousands of pounds, owing to the default of a friend for whom he had become guarantee. As his present means are unequal to meet this demand, and he can offer no adequate security for a loan, the consequence must be ruin to himself and his family, unless some individual of wealth and munificence will step forward to avert this calamity, by applying £4000 to his rescue. For this he frankly avows that he can, in present circumstances, offer no other return than his gratitude. A personal interview, however painful, will be readily granted, in the confidence that the generosity of his benefactor will be the best guarantee for his delicate observance of secrecy. He hopes his distressing condition will protect him from the prying of heartless curiosity; and to prevent the approaches of money-lenders, he begs to repeat that he can give no security. Address to "Anxious," General Post-office, London.' This 'anxious' man of rank made known his trifling want in the Times of January 1844.

The sixth and last column of the first page of the Times is invariably devoted to equestrian and vehicular advertisements. Any gentleman who may want a clever hack, a quiet cob, a powerful horse of splendid action, warranted to ride or drive; or any tradesman requiring a team of superior young cart-horses, has only to consult his newspaper.

Over leaf, on the second page of the Times, persons in want of 'apartments' or lodgings, 'with or without board,' will find many places to choose from. Announcements of public companies which are of a more general interest come next. Amongst them sometimes

appear singular effusions, chiefly consisting of the schemes of enthusiastic patriots and headlong politicians, who invent plans for setting everything to rights in this complicated community, as fast as the horses, announced for sale in a previous column, can gallop. One, which was published about twelve months since, we have carefully preserved. It is by a political regenerator who dates from Cheapside:—

'TO THE MINISTERS OF STATE, NOBILITY, AND COMMUNITY AT LARGE.—A Remedy for the Distresses of England.—Every considerate person admits the present condition of society to be perfectly anomalous. A remedy has at length been discovered—a remedy which would effectually arrest the progress of pauperism, confer incalculable benefits upon the industrial community, and diffuse joy and gladness throughout the length and breadth of the land, making England (without exaggeration) the envy of surrounding nations, and the admiration of the world. The plan possesses the peculiar merit of being practicable, and easy of application, without in the slightest degree infringing the rights of property as by law established, or in any way disturbing the present relations of society. The advertiser will communicate his discovery either to the ministers of state, nobility, or those who may take an interest in the wellbeing of society, on condition of his receiving (if his plans are approved, and made available for the purposes contemplated) £100,000. "If the nation be saved, it is not to be saved by the ordinary operations of statesmanship."—Lord Ashley.' The modesty of the advertiser prevents him from adding in words what he evidently wishes the reader to conclude; namely, that the nation is only to be saved by E. S., of No. 142 Cheapside.

The rest of the columns of the Times usually occupied by advertisements are filled with announcements of new works, either just out, or in preparation; patent medicines, and sales by auction. One department is benevolently set aside for the insertion of short applications for places from domestic servants. These advertisements are received at a price which little more than covers the duty, and expense of composing.

Lastly come the rhetorical advertisements. These flow from the fervent pens of imaginative auctioneers, 'who'—to quote Mr Puff once more—'crowd their announcements with panegyric superlatives, each rising above the other, like the bidders in their own auction-rooms; inlaying 'their phraseology with variegated chips of exotic metaphor.' The skill with which their descriptions of houses or of lands magnify excellences and conceal defects without making an entire sacrifice of truth, is on some occasions wonderful. When a mansion is dilapidated, that is described as a lucky circumstance, for, 'with a trifling outlay, the fortunate purchaser will be afforded a fine opportunity of exercising his taste in restoration, alteration, and decoration.' Sometimes the auctioneer is 'happy' to announce that a large portion of the estate now for sale is in a completely uncultivated state, so that the possessor will have a fine field for the introduction of those wonderful improvements in draining and agricultural chemistry which are now at his disposal. We must admit, however, that these wordy announcements are less frequent in the Times than in other newspapers, although the above expressions are copied from its pages. The truth is, the graces of rhetoric are not exempted from the high charges of that densely filled journal, but cost as much per line as the veriest cheesemonger's puff. Economy therefore obliges the verbose auctioneer to be sparing of adjectives, and to cut out his most exalted superlatives. It is only when the magnitude of the transaction enables him—*heureusement*—to puff off the property 'regardless of expense,' that he is able to take a high flight in a long advertisement.

We have now reviewed the various announcements which, taking the average, daily appear in the Times newspaper. By an orderly arrangement of the printer, the different kinds we have adverted to appear as nearly

as possible in the portions of the vast sheet which we have described, so that a practised reader can tell, within a column or so, where to pitch upon the sort of announcement he may wish to peruse. No one possessed of a spice of philosophy can glance over those broad sheets, without extracting a deep meaning from the mass, and without getting a strong insight into human nature from many of the individual advertisements. Had the *Acta Diurna* of the Romans contained similar announcements, we should have learned more of their private life and habits from one of its numbers, than from all the classical works which have been handed down to us.

LUKE HUSLER.

A TALE OF AMERICAN LIFE, BY PERCY B. ST JOHN.

THERE are many characters in whom the good predominates very much over the evil, and yet who, from the mere fact of their being unable to say 'no,' when asked to join either in the execution of wise or foolish plans, or to do that which their native genius prompts them to declare an error, have fallen from the place in which their fortune and their personal endowments had placed them, and become members of the great body of the outcast. There are two forms of this weakness. With some, it is the effect of constitutional feebleness of mind; with others, it arises solely from want of that moral courage which prompts the firm man never to deviate from the right path to please the fancies of others. 'I did not like to say no,' is a phrase with which the half of mankind, particularly young men, excuse those faults which are at the same time their own bane and that of all around them.

In a small village in a remote county of the state of New York, there lived, some short time before my visit to the republic of Texas, a young man of the name of Luke Husler. From his own confession to me at a later period, the characteristic, which I have above slightly sketched, was peculiarly his. To proceed, however, chronologically. The village to which I allude was small, and very picturesquely situated. Like every similar locality in America, it possessed a church, or rather chapel, and a schoolhouse. But though it had a considerable number of inhabitants, it did not boast—a rare circumstance in the United States—either a newspaper or a grog-shop. One reason for the absence of a local organ, was the population being divided pretty equally among English, German, and French, all speaking of course their own languages. Why the public-house existed not, was a fact which often puzzled the heads of even the oldest inhabitants. But as every one in the village had already a distinct business, and all were thriving, no one thought proper to take upon himself the responsibility of setting on foot so serious an undertaking.

Little York, as the village was called, possessed the usual variety of 'characters,' but the purpose of my narrative only demands that I should allude to a few. In the first place, Luke Husler was no mean person, either in his own opinion or in that of those around him. At three-and-twenty owner of a fancy store, where articles of both male and female clothing were to be had perfectly new at a moment's notice, and possessed of a handsome countenance and prepossessing manner, young Luke, as he stood with his hands in his pockets, chewing an unlit cigar, in the front of his store, could nod and bow to every inhabitant in Little York, and yet by no means be thought to make himself too familiar. The neatness of his store in some measure conduced to his popularity. Built of pine boards, on a raised platform of piles, one storey in height, with conical roof, the whole carefully whitewashed, with a flight of wooden steps leading to the door, it was a very model of order and cleanliness. Behind its two plain but neat counters were rows of shelves, containing the articles in

which he dealt, while at the rear of the premises was the 'snuggery,' where the owner took his meals, and which also served the purpose of a sleeping chamber. An aged female, black as Erebus, was his charwoman, with whose hired assistance everything was kept in that particular style of order which is familiarly though strangely enough known as 'apple-pie.'

'Luke Husler, Dry Store,' were the words which appeared in large letters over the door, while exactly opposite, a small private house, with white curtains, green blinds, and whitewashed boards, like the store, exhibited on a scroll in small letters the words, 'Martha Dalton, Milliner.' To this house Luke's eyes were directed oftener than to any other in the neighbourhood, which may in part be explained by its situation. But a pair of blue eyes, a fair and gentle face, and auburn ringlets, were continually to be seen near the little open window; and whether the house or the lady formed the peculiar attraction, is a matter which I leave to be decided by the acute and discerning reader. Martha Dalton was a widow; but Martha Dalton was not the object of Luke Husler's solicitude, but her daughter. An Englishwoman by birth, as was her daughter, they had lost their only male relative some years before. Their income, the interest of a few thousand dollars, being small, they had retreated to this retired locality, and, more to occupy their time, and give themselves a settled position, than from any other reason, had opened the business which I have already designated. Mary Dalton and Luke Husler, at the time I now speak of, were engaged in marriage, and a very short time was to ensue ere they were to be united for ever.

When business was over, as it is ever at a very early hour in American villages, Luke would make himself smart, and, with a regularity as great as that of the clock which guided his movements, spend his evening in company with his beloved. They were very happy; no untoward occurrence ever chequered their quiet life. With the young man, business was regular and profitable; with Mary and her mother, it was as good as they had any wish for it to be. Few American villages were so quiet and well conducted as Little York. There was just enough of sociality to give zest to existence; while there were no dissipations of any kind to tempt the sober citizens from their steady and uneventful life.

One morning in the spring of 1839, the inhabitants of Little York were surprised, on rising from their peaceful couches, to hear the loud clamour of men engaged in building. Hammers were being used at a most rapid rate by some half-dozen men, saws were heard grating, and the loud voice of one in authority directing the proceedings. A general rush took place into the streets—street I should say—and in a very short time the whole male population were congregated at the western extremity of the village. Here, at early dawn, a large frame-house had been marked out, and ere the primitive inhabitants of Little York had risen from their beds, the whole of the supporting beams had been firmly planted. Cart-loads of planks, shingle, logs, &c. were heaped up, and a dozen men busily employed in giving shape and form to the rude materials. Hard by, standing upon a heap of wood, was a small thin man, who in a shrill but very loud voice was giving his orders right and left. Despite the crowd which had collected, he paid not the slightest attention to them, continuing the rapid enunciation of his command. The Little Yorkites were thunderstricken. What could be about? The house was manifestly of too large dimensions for a private residence. Its frame, too, divided into apartments large and small, showed it not to be a church.

After some deliberation, Luke, who was, as I have already stated, a popular man, advanced toward the little individual above mentioned, and in a very polite manner 'reckoned' he was a stranger. The little man very drily 'guessed' he was. Luke, not at all abashed, 'concluded' he was builder 'a pretty considerable tall'

house; the little man had a 'notion' it was 'smart.' Luke 'calculated' it would cost a few dollars; the little man 'supposed' it would. It was evident that 'elanting,' as the Americans call it, was of no use; a point blank question could alone elicit the truth. Luke therefore at length very gravely and seriously inquired the stranger's object. 'Well, friend,' replied the other, 'I sh't exactly availed what I'll do yet, and that's a fact. About four o'clock I reckon to have made up my mind.'

Luke withdrew at once from the contest; and the hour of breakfast approaching, the crowd rapidly dispersed. Great was the excitement in the minds of all; and so much were they moved, that even some regular down-east Yankees were heard to express an opinion between the rapid mouthfuls in which Americans usually silently indulge. The morning passed; noon came; and under the industrious hands of numerous workmen, the huge wooden house was approaching rapidly towards completion. Before four o'clock it was finished, and the white-washers were hard at work on the outside, while the 'hands' were busily engaged in unloading from a covered wagon the owner's goods and chattels, amongst which I may perhaps be allowed to include a buxom dame, who appeared to be his wife, and a pretty girl, who was without doubt his daughter. Still the mystery was unsolved, as to the view with which the house was erected. This mystery, however, was not long to continue; for the wagon being at length unloaded, the men drew from beneath a long narrow piece of wood, on which, in red letters on a white ground, were written the fatal words, 'Silas Hoyt—The General Jackson Liquor Store, Nine-pin Alley.' The patriarchs groaned audibly: the peace, virtue, and happiness of Little York, they felt, had departed with the erection of what was clearly nothing more nor less than a grog-shop. The young men were silent: the thing had come upon them so unexpectedly, they knew scarcely what to make of it. The crowd dispersed, and each little group departed to discuss the occurrence over their own fireside. That evening many a sigh emanated from the bosom of wives and mothers: all felt as if a moral revolution had taken place, and the genius of riot and disorder had triumphed over peace and domestic happiness. Mary Dalton, her mother, and Luke Husler were as usual together, when the subject was brought up. Luke firmly protested against the innovation in no measured terms, the more that the cutting manners of the host still rankled within his bosom. Mary was delighted, as well as her mother, and the conversation glided into other channels.

No matter how small the number of any community, there are sure to be within its circle some one or more dissolutely-disposed members. Almost before the shelves were erected on which the liquor bottles were to be displayed, a small knot of men had congregated round the bar of the General Jackson, and on the second evening of its existence, a card table was in full play. Several, who dropped in merely to pass an hour in the Nine-pin Alley, were tempted to take a glass at the bar. One followed another, until, excited by the seducing power of the great current poison of the earth, they also stopped; and, just 'to pass the time,' games of gucca, rounce, and loo, were proposed and voted by acclamation.

Amid the general infection, which in two months spread with fatal virulence, Luke remained uncorrupted, and on no one occasion did he set his foot within the doors of the lazar-house of Little York. Mary was delighted, while every grieved father and mother whose son had been drawn into the vortex pointed him out as a model. It was Luke's habit—strolling with one's future wife not being etiquette in certain parts of America—to take a walk every evening ere he visited the Daltons. These walks always took him by the door of the General Jackson, which doubtless made the merit of his abstinence the greater. On one occasion Luke was returning from his stroll, or 'slouch,' as he was wont to call it, when, as he neared the mansion owned by Silas Hoyt, two friends rushed forth from the door and saluted him. 'Come, Luke,' said one, 'we must drink a glass to your

health.' 'And welcome,' replied he, tendering a quarter dollar. 'Mr Husler,' exclaimed the pair in unison, both the worse for whisky, 'when we liquor at a friend's expense, we do so with him.' 'Come to my store then.' 'Here's the Gin'ral, a deal handier.' 'I never enter grog-shops,' replied Luke. 'Nonsense! it's all that girl. Well, I wouldn't be tied to a pair of apron strings after that fashion, nohow you can fix it.' 'Sir!' exclaimed Luke scornfully, 'you are beneath my notice, or I'd chastise your insolence;' and he walked away.

The following evening the two friends again waylaid him, this time sober, and with many apologies excused their rudeness of the previous day. Luke good-humouredly forgave them; and when they proposed to cement their reconciliation over a glass, hesitated. Their sneers about the influence of Mary Dalton over him had told—he was vexed to be publicly ridiculed for what he felt inwardly to be an influence for good. The proverb about hesitation is well known. Luke entered the General Jackson, and drank at the bar. The whole conclave crowded round to be treated. Luke could not avoid drinking with all. That evening Mary Dalton spent alone. It was very late ere she retired to rest, in the faint hope of her lover at length making his appearance.

Morning found Luke in a fever both of mind and body. He was heartily ashamed of himself, while the prospect of an explanation in the evening with his fair betrothed tended nowise to tranquillise his thoughts. Stay in his store all day he could not; his ideas were too unsettled for business; and accordingly, leaving his female attendant in charge of his affairs, he stole out by the back way, and, just to pass the time until the hour for his visit to Mary came round, joined the idlers who now ever thronged the bar-room of the grog-shop. Society alone was not a sufficient distraction, and cards were resorted to. Again Mary Dalton spent her evening without seeing her lover, until, after watching past midnight, she perceived him reel home in a state of senseless intoxication. Mary sighed, and went to bed.

Before Luke was up, a message was brought him from Mrs Dalton, inquiring most kindly after his health, and gently reproaching him with his absence; she further requested his company to breakfast. He went, and was received without a word of reproach; until Mary sweetly, and with a tear in her eye, shook her head, and observed—'We thought, Luke, you were not coming to see us again.' The young man could not withstand this; but speaking with extreme volubility, confessed his error, and made a strong promise of amendment. During the progress of his speech he let fall the words—'I did not like to say no, and that is the real truth.' Both Mary and her mother started, and were silent for a moment. At length Mrs Dalton roused herself and spoke: 'Those words of yours have raised within me very sad remembrances. My husband, Luke, was a well-disposed and honest man, but he was weak—he could not say no. Drink was poison to him, but he had not the heart to refuse to join a friend in a glass. A hundred times, when ill and feverish from a slight over-indulgence, has he said, "Martha, I know I have done wrong, but I didn't like to say no." For Heaven's sake, my dear Luke, let this be a warning to you. This easy disposition in Richard Dalton made me a widow; let it not deprive me of a son-in-law.' The young man blushed deeply, and promised to exert more firmness of mind. After some further conversation he took his leave.

Luke was neither badly-disposed nor more weak-minded than usual, but he was very young, and naturally fond of excitement. It was some time, however, before he again visited the scene of temptation; but visit it again he did; until at length, drawn into a complete vortex of dissipation, the habit grew upon him, and became confirmed. For some time his dereliction from the path of rectitude was kept secret from Mary, though his altered manners and mien gave sufficient token of the company he now kept.

The author seldom went to the printer direct, but applied to the bookseller (of whom many eminent ones were in business at the time we refer to), taking with him his manuscript and his subscription list. In the eyes of the publisher, the merits or demerits of the book were of less consequence than the number of subscribers. He carefully weighed one with the other: he considered the probabilities of a chance demand for the book over and above the sale assured from subscriptions; and offered the author a certain sum to be allowed to take the whole thing off his hands. In the case of a writer of established reputation, competition occasionally occurred amongst 'the trade' for the bargain. Some of the intricacies of these transactions may be learned from Dr Johnson's account of the manner in which Pope's *Homer's Iliad* was brought out. The poet, in his 'proposals,' offered the work—in six volumes quarto—for six guineas. 'The greatness of the design,' says the elegantly verbose doctor, 'the popularity of the author, and the attention of the literary world, naturally raised such expectations of the future sale, that the booksellers made their offers with great eagerness; but the highest bidder was Bernard Lintot, who became proprietor on condition of supplying at his own expense all the copies which were to be delivered to subscribers or presented to friends, and paying two hundred pounds for every volume. Of the quartos, it was, I believe, stipulated that none should be printed but for the author, that the subscription might not be depreciated; but Lintot impressed the same pages upon a small folio, and paper perhaps a little thinner; and sold exactly at half the price, for half a guinea each volume, books so little inferior to the quartos, that, by a fraud of trade, those folios, being afterwards shortened by cutting away the top and bottom, were sold as copies printed for the subscribers. Lintot printed two hundred and fifty on royal paper in folio, for two guineas a volume; of the small folio, having printed seventeen hundred and fifty copies of the first volume, he reduced the number in the other volumes to a thousand. It is unpleasant to relate that the bookseller, after all his hopes and all his liberality, was, by a very unjust and illegal action, defrauded of his profit. An edition of the English "*Iliad*" was printed in Holland in duodecimo, and imported clandestinely for the gratification of those who were impatient to read what they could not yet afford to buy. This fraud could only be counteracted by an edition equally cheap and more commodious; and Lintot was compelled to contract his folio at once into a duodecimo, and lose the advantage of an intermediate gradation. The notes, which in the Dutch copies were placed at the end of each book, as they had been in the large volumes, were now subjoined to the text in the same page, and are therefore more easily consulted. Of this edition two thousand five hundred were first printed, and five thousand a few weeks afterwards; but indeed great numbers were necessary to produce considerable profit.'

Sometimes publishers employed authors to write books for small sums; and having sufficient interest to procure the services of that very necessary person, a noble patron, obtained subscriptions on their own account in the name of the author. By this proceeding large profits were sometimes realised. Indeed, despite all drawbacks arising from piracy and other causes, some of the booksellers of this period made large fortunes. The Lintots (of whom there were four in the trade), the Tonsons, Curll, Cave, and other contemporary publishers, realised large sums of money by their speculations.

While, however, the patron and subscription system of book-selling was in full operation, a small and silently-working influence was gradually gaining strength to overthrow it; and this was periodical literature. By 1709, several newspapers had been established in London; but these had little or no effect upon 'the trade,' compared with such periodicals as the *Tatler*, *Spectator*, and *Guardian*. Not many years afterwards (1731), Mr Cave conceived the idea of collecting the principal original papers from the newspapers into a monthly repo-

sitory, to which the name of magazine should be applied. Hence the '*Gentleman's Magazine*,' which began in that year, and still exists, the venerable parent of a host of lighter-headed children. Its success was so great, that rivals soon started up. The '*London*,' the '*Monthly Review*,' and the '*Critical*,' were the most remarkable: these works in time changed the whole system of book-selling. They became channels of information on literary subjects, and by their aid an author's merits were made known to the public without the intervention of a titled patron. They took the patronage of men of letters out of the hands of the great and fashionable, and transferred it to the people. Literature becoming no longer a matter of mere fashion but of intellectual taste and art, booksellers began to buy manuscripts from authors at their own risk, and to address them directly to the reading public, without the aid of previous subscribers. By this change the trade was conducted on a more solid and independent basis. That a riddance of the thralldom which literature had hitherto endured was beneficial to it, is proved from the fact, that in proportion as the subscribing plan was abandoned (for it is not wholly given up even at present), so the number of published works increased. From 1700 to 1756, only about 5280 new works (exclusive of tracts and pamphlets) were issued—or about ninety-three per annum; whilst from the latter year to 1803, this average of new works increased nearly ninety-three per cent.*

From the more independent system of publishing, must be dated the footing upon which the English trade now stands. The London booksellers who were rich enough to buy manuscripts, and to get them printed on their own responsibility, formed themselves into a class, who sold wholesale, and got the title of 'publishers'; whilst those who retailed the works remained booksellers. It was during the latter part of the career of such men as Johnson, Goldsmith, Smollett, Fielding, Richardson, &c. that this division took place. The publishers—who chiefly resided in London or in Edinburgh—few in number, exhibited less rivalry than is usually seen in other trades. When an author presented himself whose great reputation warranted him in demanding a large price for his manuscript, the publishers united to purchase the copyright. Hence, one half of the title-pages of many works published at the end of the last century is occupied by a list of the publishers who took shares in the risk. By this sort of combination, an expensive book was 'pushed' amongst the connexion of each shareholder, and had a better chance of success than if undertaken by one individual.

This sort of unanimity amongst 'the trade' was very injurious to the public. It kept the price of books so high, that none but persons of fortune could afford to buy them; and the only method by which a man of moderate means could get access to them was by joining a book-club, or by borrowing from circulating libraries. But the cause of the high price of books must not be solely attributed to publishers. Paper-making and printing were at that time slow and expensive processes, and that of itself rendered books dear.

At the end of the last century, a new era dawned on the career of the book-trade. A shrewd, intelligent, but humble journeyman printer saw that the publishers of his day, by the price at which they kept their works, exclusively addressed a single class instead of the whole public. He could not, it is true—from the expense of materials—devise any plan to reduce the cost of books; but he invented a mode of issue by which they were rendered accessible to the humbler classes. As this was the earliest attempt at popular book-selling, we shall dwell a little upon it, and upon its originator.

Henry Fisher, the individual alluded to, while yet a journeyman in the employment of Mr Jonas Nuttall, the founder of the 'Caxton press' in Liverpool, conceived the happy notion, that if expensive works were supplied to poorer customers in cheap parts, and perio-

* Penny Magazine, vol. vi. p. 806.

dically till complete, a vast number of persons would become eager purchasers, who regarded books as an unattainable luxury. This plan, however, had its obstacles. The easy, almost sleepy manner in which bookselling was conducted by the metropolitan publishers and their provincial agents, forbade a hope that the regular trade would second it. When, for instance, they sold a bible, it was one transaction, which cost little trouble; but to have that bible divided into twenty parts, and disposed of by twenty instalments, of course entailed twenty times the trouble. Such an increase of business, without the prospect of an accession of profit, was not to be thought of. Again, if even the general trade had fallen in with Fisher's views, it was quite unlikely that they could have carried them out. Their customers were few, and essentially a class; the market was limited, and something was necessary to be done to extend it. Young Fisher therefore proposed to Nuttall that he should not only print standard works in cheap numbers, but sell them upon an entirely new plan. This consisted in establishing depôts in every principal town. To each of these was attached a staff of hawkers, who branched off all over the district, going from door to door, leaving prospectuses, and offering the numbers for sale. By such means books found their way into remote places, and into houses in which they were never before seen. Though only twenty years old, Fisher was intrusted with the establishment and management of the depôt at Bristol. Amongst the first books printed for sale in this manner were the Family Bible, Bunyan's Pilgrim's Progress, Josephus, and several standard devotional works. The bible was issued in forty parts, at a shilling each. The hawker, when he made his call, displayed the first part as a temptation. If he could not succeed in securing a customer at once, he requested permission to leave it for a week, and generally found at his second visit that a decision had been come to in favour of keeping that number, and of periodically purchasing the succeeding ones. Thus, persons who could easily afford the disbursement of a shilling a-week for the gradual purchase of a book, but would have passed their lives without entertaining the thought of giving two pounds for a bible in one sum, became in time the possessors of a little but select library.

As a pecuniary speculation, this 'number system,' as it was called, succeeded beyond its projector's hopes. Fisher was employed at Bristol for three years with so much benefit to his employer and credit to himself, that Mr Nuttall recalled him to Liverpool, took him into partnership, and allowed him, besides his share of the business, £900 a-year for managing it. The plan was adopted by others, and by none without enabling them to realise large fortunes. Several old and respectable publishers in London, Edinburgh, and Glasgow, date their origin from their founders commencing as 'canvassers' in the employ of Nuttall and Fisher.

Singularly confirmative of Fisher's views was the fact that, after his plan had been extensively carried out for several years, it was found that it had wrought but little change on the regular trade, despite strong anticipations that so active a competition would have very much damaged it. The truth was, the market created for the 'numbers' was entirely new; the people who purchased them never did buy, and never would have bought, the expensive works of the more aristocratic branches of 'the trade,' who, despite the vast spread of books in the substrata of society, still retained their old customers at the old prices. The great metropolitan publishers went on realising large profits upon a limited amount of business as heretofore, till the invention of steam-printing caused them to bestir themselves a little more actively.

It was about this time (1825) that Archibald Constable of Edinburgh propounded to Sir Walter Scott and Mr Lockhart a plan for revolutionising the entire trade by the aid of steam and cheap printing. 'Literary genius,' he exclaimed, 'may or may not have

done its best; but printing and bookselling, as instruments for enlightening mankind, and of course for making money, are as yet in mere infancy. Yes, the trade are in their cradle.' He then shadowed forth his outline:—'A three shilling or half-crown volume every month, which must and shall sell, not by thousands, or tens of thousands, but by hundreds of thousands—ay by millions! Twelve volumes in the year, a halfpenny of profit upon every copy of which will make me richer than the possession of all the copyrights of all the quartos that ever were, or will be hot-pressed!—twelve volumes so good, that millions must wish to have them; and so cheap, that every butcher's callant may have them, if he pleases to let me tax him sixpence a-week!' Bright, and not extravagant visions; but, alas! it was destined that others should realise them. In the following year Constable was a bankrupt. When his affairs were wound up, he commenced his Miscellany, but with crippled means and a crushed spirit, which soon after was quelled in death. By his successors, the series was managed with little success, and after a few years it was discontinued. Still, however, the plan did not sink. Murray in his 'Family Library,' Longman and Co. in their 'Cabinet Cyclopædia' and other such series, Colburn and Bentley in their 'National Library,' carried it out for several years with more or less success; and at that time it appeared as if no books other than monthly volumes at five or six shillings would sell.

Meanwhile, the Society for the Diffusion of Useful Knowledge had commenced a series of sixpenny publications, embracing the principal sciences, and thus were showing the way to still further declensions in the cost of literature. It was remarked, however, that even these comparatively cheap issues were absorbed, not by the working-classes, to whom they were professedly addressed, but by the middle ranks. And thus it has ever been with books of all kinds: direct them to one class, and they hit the next above. It became necessary, in order to reach the great bulk of the people, that cheaper works still should be presented. It was with some such views that the publishers of the present work commenced it on the 4th of February 1832. Weekly sheets, composed of matter chiefly compiled, and aiming at no literary distinction, had previously been by no means rare; nor were they unsuccessful. But this, we believe, was the first attempt to furnish original literary matter of merit through such a medium. It was followed, almost immediately, by the well-known Penny Magazine, the Saturday Magazine, and other similar series, most of which attained, like the Journal, a circulation of many thousands. This mode of publication, followed as it has been by that of cheap editions of books in and out of copyright, has produced a great change in the trade. The warehouses of the great publishers are much less scenes of quiet and ease than they were; trouble is multiplied, and profit diminished, but the trade is enormously extended. The number of retailers of books, especially in suburban situations, has been vastly increased through the same cause. In short, a revolution has taken place, and if the bookseller now feels himself somewhat less stately and at ease than he used to be, he may have the satisfaction of feeling that his usefulness as a member of society has been greatly extended.

It is now time to give a short summary of the internal arrangements by which bookselling is carried on; for, unlike some other trades, it has few 'secrets.' The first step which a publisher usually takes when he has printed a new book, is to send it round to his brethren to have it 'subscribed'; that is, to learn from each house how many copies they will venture to take; and, to induce them to speculate, the copies thus subscribed for are delivered at a certain per centage less than the regular trade price. The copies thus supplied to the wholesale metropolitan houses are then distributed throughout the retail trade, both in town and country; for every provincial bookseller selects a London or Edinburgh pub-

fish-house as his agent, for the supply of whatever works he may order. Such books are purchased by the agent from the publisher; and when they have accumulated sufficiently to cover the expense of carriage, they are made up into a parcel, and sent to the retailer. This generally happened, up to about ten years ago, on the last day of a month, when the magazines are published; for of them alone the general demand is so great, that they form a bulky parcel for each bookseller. In 1837, one of 'the trade,' many years conversant with the great literary hive of London on 'Magazine Day,' made the following computations: The periodical works sold on the last day of the month amounted to 500,000 copies. The amount of cash expended in the purchase of these was £25,000. The parcels despatched into the country per month were 2000. These parcels, it must be remembered, not only contained magazines, but all the works ordered during the preceding part of the month.

Since then, however, the vast increase of weekly publications, the opening of railroads, the extension of steam navigation, and other causes, have in a great measure withdrawn the bulk of books from the monthly to weekly parcels, one of which every respectable provincial bookseller now regularly receives. To estimate the contents or number of these would be impossible; but we have no hesitation in saying that they more than double the above computation in all its calculations.

We learn by the abstract of occupations from the last census, that in Great Britain there are 13,355 booksellers, publishers, and bookbinders, 5499 of whom reside in London. In Scotland, there are 2547 persons following the same trades. In Edinburgh alone, there are 786 individuals connected with 'the trade.'

MISCELLANEA.

Amusements for the Insane are commented upon in an interesting manner in Dr Browne's last report on the Crichton Institution of Dumfries. 'The great and engrossing business of the life of the insane is,' he says, 'to support sorrow, to contend with intense emotion, or to be bound and drenched by delusion or fatuity. However numerous and varied the fancies and feelings in some of these states may appear to be, the characteristic of all is sameness, monotony, insipidity. The mind dwells upon a single idea, it excludes all collateral associations, or it bends all its powers or stores into this focus; or the same train of thought returns day after day, hour after hour, attracting and converting every new impression into the main current; or it is a desert, a void, a chaos. In alleviating these conditions, mirth and recreation become endowed with higher attributes—they cease to be frivolous diversions, and assume the rank of instruments of cure. They suggest and supply new and delightful sources of reflection to the barren and inactive mind; they supplant more debased and more painful impressions; they seduce and deceive the sorrowful and dejected into temporary composure, and diffuse that tone of gentle hilarity which is so conducive to health and peace.' Dr Browne then proceeds to describe the measures resorted to in his institution for supplying this needful mental medicine and sustenance. 'Wherever it was possible,' he says, 'such entertainments were selected as seemed calculated to yield higher and purer gratification than mere mirth, such as, if failing "to point a moral," might impart some truth, recall some natural affection or sympathy, arrest attention, stimulate reflection. In strict accordance with this view, a successful attempt was made to introduce lectures upon natural science, as a mode of communicating a class of ideas totally new and unexciting, and of demonstrating by experiment and explanation the actual simplicity of many facts and phenomena and natural processes apparently as mysterious and inexplicable as the hallucinations which prevailed among the audience. Notwithstanding the incompleteness of the machinery, several evenings were most usefully and pleasantly occupied in lectures by Mr Aitken of Dumfries on the physical, and Mr Balfour on the chemical, properties of the atmosphere. Fifty-five patients attended these exhibitions. Their deportment indicated deep interest and curiosity; and although wonder was perhaps the predominating feeling, it was rather the wonder of newly-awakened intelligence than of awe or ignorance. Subsequent inquiries, discussions,

and criticisms, proved that much information had been acquired or revived, and that the principles of the pump or syphon, and the analysis of water, had neither been misconstrued nor forgotten. In situations where the splendours of chemistry may be exhibited while its truths are taught, inexhaustible means will always exist to amuse and improve the insane.

'Theatrical representation, as a mean of cure and pleasure to the insane, is not now confined to the Crichton Institution. Melo-dramas have been acted before the inmates of asylums in this country; and Tartuffe has been produced by the patients in Saltpetriere with the same sort of poetical justice which suggested the selection of Redgauntlet by the company in this asylum. Three pieces were brought out during last season; of these the Mook Doctor was the favourite. It contains some ludicrous allusions to asylums and their governors; and the shouts of laughter and triumph with which the exposure of the savage practices formerly pursued in these places was received, indicated how keenly some portion of the audience understood the point and truth of the satire, and how cordially they rejoiced at the revolution which had established the gentler rule under which they then were. Eleven patients participated in some degree or other in the representation. Four of these have since left the institution; and a fifth, who is undoubtedly indebted to the exercise of memory, in acquiring his part, for a resuscitation of intellect, will soon obtain liberty. But the company will survive such losses, even the desertion of our active stage-manager. In one case only, either among the actors or the auditors, could excitement be attributed to the effects of the amusements. A plain prosaic, but perhaps vain artisan was raised to the rank of lord of the bedchamber, and although all that was required in the part was to stand still and look steadily at a particular point during a mimic pageant, the assumption of dignity, the novelty of the position, or the constraint necessary, destroyed the equanimity which had been previously established, and retarded convalescence. But this event was the consequence of injudicious selection, of a sanguine estimate of the stability of reason, not of the ordeal to which the mind was subjected, and might have followed an incautious appeal to vanity, or the liberation of the patient. After an experience of two successive years, and when about to commence a third season, and after a dispassionate examination of the effect which the stage, when well directed, is capable of exerting by the exposure and correction of follies, by the discipline, consecutive intellectual training, and the concentration imposed upon the performers, and by the gaiety and good humour excited in the spectators, this conclusion appears to be inevitable—that no human mean as yet employed has, at so little risk, and with so little trouble and expense, communicated so much rational happiness to so many of the insane at the same time, or so completely placed them in circumstances so closely allied to those of sane beings, or so calculated either to remove the burden of mental disease, or to render it more bearable. The attempt is no longer an experiment. It is a great fact in moral science, and must be accepted and acted upon.

'Parties of patients have attended all the public concerts which have taken place. They derived exquisite pleasure from these entertainments, and have rarely disturbed the pleasure of others. A lady who had not left the precincts of an asylum, or mingled in the society of the sane for twelve years, was one of Mr Wilson's auditors. She was at the same time in an intermediate state between fury and fatuity, when her mind is more clear and vivacious than during health. The immediate effect, partly of her reunion with her own species, partly of melodies to which she was familiar in other times, was deep and impassioned interest; the ultimate effect was the revival of a taste for music, which enlarges the sphere of her enjoyments, if it does not elevate their nature and tendency. The kindness of amateurs, and the opportune visits of glee singers, have enabled us to vary our ordinary routine of recreation by vocal concerts. A recent arrangement with a respectable instrumental band places a monthly musical soiree at our command; and as the choice of pieces ranges from the efforts of the first masters to simple national airs, the plan provides for all tastes, and is exceedingly popular. It would be preposterous to claim for music any special power over either the savage or insane breast; but those who have joined our festivities will be inclined to yield to it considerable influence in tranquillising agitation, in assuaging sorrow, and in subduing passion.

"These have been the staple and most novel pastimes; but others have been resorted to with equal success. The great festivities of burning the Christmas Log, Twelfth Night, Hallowe'en, have diffused the cheerfulness of these seasons, and have refreshed and revived early and healthy associations. Balls and meetings for music and dancing have been numerous, and form epochs in the calendar. Legerdemain, phantasmagoria, have been exhibited and explained, that the illusions might be attributed to their legitimate sources, and not regarded as realities. Amusement has been sought abroad when the resources in the asylum failed. Public lectures have been attended: the theatre, the circus, the menageries, the races—even the cattle-shows—have obtained patrons and admirers. Fifty-nine patients have visited these places. Excursions have been made to those spots which present objects of interest either in natural beauty, or as remains of antiquity. The addition of a new, and handsome, and commodious omnibus to the establishment, which is capable of containing fourteen or eighteen persons, divided into three parties, will render these journeys more agreeable, and accessible to a greater number. Patients have partaken of the hospitality of friends and strangers; and, which is more extraordinary, they have revisited the homes of their youth, still inhabited by their relatives, and returned to the home of their altered position with alacrity and gladness. In one or other of these amusements generally, or only upon certain occasions, have one hundred and six patients, of both sexes, joined freely, voluntarily, or by advice."

The Monthly Satellite, a temperance journal published at Banff, contains the following paragraph, written in the earnestness of a most laudable enthusiasm, yet irresistibly amusing:—

SNUFF SACRIFICES.

A, had been a snuffer for thirty years—used to spend on an average fully one shilling per week, or the price of a suit of clothes per annum—has lately given it up.

B, a fifteen-year-old snuffer—has also given it up about two months ago.

C, a thirteen-year's proficient—has laid aside his box, and, with the price of keeping it full, takes out Chambers's Journal, and saves threepence weekly.

D, ten years—has also given it up.

Reader! if a snuffer, go thou and do likewise.

THE MOON.

Among the natives of the East, a belief in the hurtful effect of the moon's rays, especially on the head and eyes, is universal. This belief, the result of experience, ought not to be altogether slighted, even by those who think themselves wiser. It is very common to regard this as a mere superstition, and to deny the possibility of the moon's rays producing any effect of the kind. A mere theoretical opinion, however, is not to be depended on, when opposed to the result of experience and observation. It is a fact that the moonbeams in certain countries have a pernicious influence. It is known that in Bengal, for example, meat which has been exposed to the moonlight cannot be afterwards salted or cured, but will speedily go to corruption; whereas the same kind of meat, if sheltered from the moon, may be cured and preserved. Not only is this idea of the dangerous influence of the moon entertained by the semi-barbarous tribes of the East, but European shipmasters trading to the Mediterranean are firmly impressed with the same conviction; and they are cautioned against exposing themselves to the danger by their Sailing Guides, published in England. On one occasion, many years ago, I was on board a Maltese schooner commanded by an Englishman. We were off the coast of Africa; it was spring, and the weather delicious. It was a brilliant moonlight night, and I lay down to sleep near the poop, wrapped in my cloak. I was soon after awake by a sense of suffocation, and found the cape of my cloak drawn close over my face. I removed it, and again fell asleep. The same thing occurred a second time, and again I rid myself of the encumbrance, when the captain of the vessel cautioned me against sleeping in the moonlight with my face uncovered. I laughed at what I considered his simplicity; but, to confirm his opinion, he mentioned several instances in which the neglect of this precaution had been followed by very injurious consequences, and appealed to his Sailing Guide as authority. There I found the caution very strongly urged; and blindness, and even (if I mistake not) derangement, stated as the too frequent consequence of the moonbeams being allowed to beat for any length of time on the

head and eyes during sleep. I returned to my couch on deck, but took the precaution of fastening a handkerchief over my face.—*Journal of the Rev. W. Robertson.*

WIND AND RAIN GAUGE, ROYAL EXCHANGE.

This ingenious apparatus, which the inventor, Mr. Follett Osler, calls an anemometer, consists of a vertical fan or fly, such as is used in the construction of the modern mill, which keeps the pressure-plate always in a direct line with the wind. The pressure-plate acts on four springs of varied degrees of strength; a slight breeze presses only on the first and weakest spring, a stronger wind brings the second into play, and so on to the third and fourth—the whole four being more than equal to any force of wind which can be expected in this country. The pressure-plate works a rod, at the extremity of which is a pencil acting on a cylinder of tracing paper in the subscription room. As the pressure-plate is forced back by the wind, the pencil is proportionately pushed down on the cylinder, and thus the intensity of the wind is accurately self-registered. The direction of the wind is shown on the dials in the various parts of the building, by the usual system of rods and bevel wheels: it is also registered on the cylinder, by the agency of a perpetual screw working up and down the indicating pencil. A rain gauge is also attached to the anemometer. The rain that falls into the gauge descends into a receiver at the bottom of the anemometer; and this being suspended, in connexion with a delicate indicating rod and pencil, as it sinks, the rod falls; and thus the smallest quantity of rain is at once self-registered. The registration is effected on a cylinder, covered with graduated paper, which is made to turn round once in ninety-six hours. The clock-work is so constructed as to produce uniformity of motion. On this paper the vertical lines indicate time, while the pencils mark the pressure and velocity of the wind, and the amount of rain that falls. At the end of every ninety-six hours the paper is changed, and the register carefully preserved for reference.—*Athenaeum.*

WHY DO THEY DIE?

BY WILLIAM FORSYTH.

In the fresh glow of beauty, the first flush of light,
Should the day-dawn be swathed in the shadows of night,
And the star of the morning pass fruitless away,
And break to the fair earth its promise of day?
Ah no! Then why fade thus the loveliest flowers?
Oh why do the young and the beautiful die,
Ere they drink of the rapture of summer's sweet hours,
Ere the brow hath a cloud or the bosom a sigh?

They spring like young fountains—as pure and as free,
To freshen the earth where their pathways may be;
They lighten the oot, and they gladden the hall,
In every land beaming—the loved ones of all.
But, alas! there are gems on the night-shrouded earth,
Only lit by the stars of yon ambient sky;
The gathering cloud quenches their light at its birth,
And like these do the young and the beautiful die.

With holy love gazing through summer-lit eyes,
The free falcon-glance where no faithlessness lies,
The glad tones of laughter, the song, and the smile,
And low gentle voice that each care can beguile;
They come in the beauty of shadowless truth,
Bringing flowers to the green tree, and leaves to the bare;
They circle their brows with the bright dreams of youth,
Like the garlanded dreamers, as fleeting as fair.

Oh, could not earth foster such flowers where they grew,
With its love like the sunshine, and tears like the dew;
Oh, could not hope strengthen, nor watchfulness bind,
Nor the shadows of sorrow that brooded behind,
Detain them—the loved ones? Ah no! Day by day,
We list for some footfall in vain at the door;
Their voices of joy from some hearth pass away,
And the woodlands re-echo their laughter no more.

Be hushed! They are happy who die in their youth,
With their bosoms untainted, unspotted by truth,
Ere they feel the rude burden of earth's many ills,
Where misery saddens, and heartlessness chills.
Though, like heaven's own visions, they come and depart,
And leave not a trace to the lovingest eye,
In the faith, and the love, and the hope of the heart,
Eternally dwelling, they never can die.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 66. NEW SERIES.

SATURDAY, APRIL 5, 1845.

PRICE 1½d.

BUCKSHEESH.

THE word 'bucksheesh,' or 'bickshash,' though strange in our latitude, is but too familiar to all who have visited the East. The traveller, often wholly at the mercy of his desert guides, is compelled to endure their unreasonable exactions. Every little service has its price, and the sordid attendant seems quite incapable of assisting with one hand, without expecting in the other his customary gratuity, or bucksheesh.

Though the word is little known among us, the thing is unfortunately too common. In a thousand ways do we meet with this unwelcome manifestation of the 'itching palm.' So intimately, indeed, is bucksheesh woven into our social system, that it has been remarked by foreigners that all England might be traversed with little inconvenience, by any one who knew enough of the English language to pronounce the phrase 'How much?'

The salaries of waiters, waitresses, &c. are often, as is well known, wholly made up of bucksheesh, in the shape of little voluntary acknowledgments for civility; and in some favourable circumstances, indeed, so great is the aggregate of these small sums, that the custom of the master paying the servant is reversed, and the servant pays his employer for permission to fill the situation. The leaving servants to be thus remunerated by customers must of course be regarded as a confession that their civil attendance is not to be secured in any other way; it implies that no influence which the master possesses is regarded as sufficient to enforce upon his servants the propriety of their performing carefully the duties intrusted to them. What a confession to make respecting so large a portion of the community! And accordingly, it certainly is within the observation of most persons, that the neatly-dressed, hair-curved youth, or the smart demoiselle, with her florid cap and apron, who, as the case may be, serves up your beef-steak, will have little regard for the comfort of the man who neglects the proper modicum of bucksheesh. Failing this, your chop will be apt to vacillate between the extremes of the raw and the carbonised condition, and your plate to be sent in unwarmed. Surely arrangements fairer towards all parties might be made.

Not a little annoyance is experienced by tradesmen in the more fashionable localities at the rapacious demands of gentlemen's servants for bucksheesh, for the privilege of serving the establishments of their masters. Stewards, butlers, housekeepers, &c. have much of this patronage at their disposal, and the 'good-will' is thus put up to the highest bidder, and the tradesman who can bid most, or, in other words, fee most liberally, obtains the orders. This, however, falls heavily upon tradesmen, especially those of slender means, and prac-

tices are too often resorted to, not very honourable or even honest, to enable them to pay the demands of their patrons of the kitchen. Christmas bills are elongated with strange items, astonished masters are cajoled by shrewd stewards, and the bucksheesh of the servant is too often secured at the sacrifice of candour, and even of honesty and truth.

The general adoption of the railway system of locomotion has rendered nearly obsolete in many parts of the country a very offensive branch of bucksheesh. This 'black-mail' of civilised life was by none more pertinaciously levied than by the coachman and guard of the old school. How often have we indignantly seen the bronzed triple-coated son of the whip, who drove his own horses, and who owned a snug little 'box' on the line of road, appeal in no very gentle manner to a poor widow, whose friends had clubbed together to procure her a comfortless outside place, and who had forgotten to add to the regular fare the exactions of three coachmen and a guard! And with what unutterable contempt would Capes look at the proffered coin, if deemed less than the 'regular' gratuity! How sour-visaged was that rosy son of the road if disappointed in his previous calculations, even though poverty stared at him in the threadbare garments and scantily-clad form of the passenger! Not that we blame him, and his brother of the horn behind, as having less of the milk of human kindness than other men. It was a part of the system, the staple of their salary, and the system we blame rather than the men. The infection, too, was contagious among all in the atmosphere of coaches. The ostler who brought the ladder for the convenience of the female 'outsider,' touched his cap significantly before he took it away; and the porter, with a similar movement, forgot not to thrust his head into the coach to inform you that he had safely deposited your carpet-bag in the boot. Without a gratuity, not a cup of cold water, not a wisp of straw in a soaking rain, could be had: the commonest civility had its price: and he who would not quietly submit to pay the accustomed fees, was unceremoniously dubbed 'no gentleman.' Something similar, on a more elegant scale, was practised at the inns on the road upon those who ventured upon the costly experiment of alighting for refreshment. The decoys, the allurements, the display, the stentorian voice of the guard summoning you at the first mouthful, and the shameless bill which concluded your fifteen minutes' refreshment, are well known, though rapidly becoming features of the past.

Perhaps the most offensive manner in which bucksheesh is levied among us is in connexion with our sacred edifices—the cathedral, the church, and the chapel. That so many of those glorious piles of masonry, so interesting from their associations with bygone times, great men, and stirring incidents, containing so much

calculated to elevate and improve the mind and heart, should be closed to the mass, is to be deeply lamented. The pompous verger, with his massive keys, admits none but the bucksheesh-payer within his privileged domain: no vulgar foot must enter, no peasant eye must feast upon the fretted roofs, the long perspectives, and all the magic 'blossomings of stone.' Even when a part of the building is necessarily thrown open gratuitously (hated word to him!) to the public, for the purposes of public worship, he prevents as much as possible the stragglers from wandering, and urges the lingerers to move on, with the most commendable consideration for decency and decorum, grudging you the momentary glimpse of beauties, from the more leisurely seeing of which he makes so snug a revenue. In our humbler places of worship, the bucksheesh of the pew is not less offensive, and the more so from its incongruity with the solemn associations which such places should suggest. The pew-opener, accustomed to look upon the frequenters of the place as her customers, renders to each his appropriate attention and sitting, according to the amount of the accustomed gratuity. The seats and the sitters are graduated according to this standard; and under her guidance the liberal donor is ushered with all due formality into the reserved seats, and the empty-handed is consigned to the free sittings or some back unfurnished pew, where, in the shadow of an obstructing pillar, he is left to lament that sight and hearing are alike impossible. The sixpenny, shilling, and half-crown donor each finds his appropriate seat, and the sagacious pew-opener can, from long experience, tell at a glance under which head to class a stranger. The gentleman bucksheesh-payer sprawls on the luxurious cushions of the half-filled pew, while the delicate female who cannot afford the fee is left standing in the aisle unnoticed and uncared for.

There is one variety of bucksheesh which we ought not to omit noticing in terms of serious reprobation; namely, the bucksheesh of the workshop and the factory. Among the higher classes, this species of bucksheesh is levied in the shape of 'fees,' which in some cases are so exorbitant, as to be almost ruinous to those who are ambitious of honours or preferment. Among workmen, however, it is known by the term 'paying footing,' and is often levied in the most heartless manner. It is the more unreasonable, inasmuch as it has not for its plea past services, but merely a promise of future ones, or rather of non-hostility. Strange that mechanics and artisans, who are generally so sensitive of anything like oppression on the part of their employers, do not see the injustice and the tyranny of this practice. Surely, among all the right-thinking and right-feeling, especially among those whom poverty and toll has associated together, kindness and good-will should be mutually extended without the intervention of a paltry bribe or a cruel exaction. Let us hope that the day is not far distant when the bucksheesh of the workshop will be numbered among the things of the past.

In England, perhaps the most singular mode of levying bucksheesh is that practised at Eton during the 'montem,' which is held triennially, on which occasion the 'captain' for the year, assisted by his staff, hands round his bag to the company for the accustomed 'salt,' as it is termed, and which usually amounts to about a thousand pounds, which, with certain deductions, is appropriated to his own use. Of the thousands of the nobility and gentry and old Etonians who flock thither on such occasions to grace the spectacle, not one escapes being compelled to 'stand and deliver.' The captain, with the due admixture of the *suaviter in modo* and *fortiter in re*, unceremoniously opens the door of every carriage, and with gentlemanly audacity bags the bucksheesh, and in return gives a ticket indemnifying the donors from future exactions. The ceremony altogether, the origin of which is enveloped in obscurity, is

a strange relic of barbarous times, which would doubtless long since have passed into oblivion, had it not been found so profitable to ask on the one hand, and so ungracious or unsafe to deny on the other.

At fashionable watering-places, however, the bucksheesh system is in its fullest glory, and its ingenious developments at these places are not a little amusing. No sooner do you step outside your door with your carpet-bag, to spend a few days at the sea-side during the season, than you find all about you conspiring, as it were, to lighten your purse. Unless you clutch your portmanteau with decision, it will to a certainty be snatched from your hand by some kind porter insisting on carrying it for you. On board the steamer, not only is your fare expected, but one of the sailors invariably introduces to your notice a box, the contents of which vaguely profess to be 'for the benefit of the ship's company.' On landing, the bucksheesh plot seems to thicken. You cannot be allowed to carry your carpet-bag off the boat yourself, however light it may be; a fellow snatches it up in your very teeth, for which of course you have to pay. You are fortunate if there is no pierage, and very unfortunate if you imprudently make it known that you are in search of lodgings. If you only look round inquiringly, the cards of a dozen touters are immediately thrust into your hand, while agents of the baker, butcher, milkman, &c. skirmish in the background, waiting to see where you will settle down, in order to pounce upon a new customer. Then there is the bath-room, the subscription concert, the excursion, the raffle, and a thousand other genteel ramifications of bucksheesh, none of which, if you have any pretensions to respectability, can you avoid. Cards innumerable follow immediately you have chosen a lodging. Asses' milk, baths, donkeys, home-made bread, guides, circulating libraries, are all obtruded upon your notice with a pertinacity that seems determined you *shall* want them, whether you do or not. You *must* subscribe to the library, because all the gentlemen go there to read the newspapers: you *must* have a copy of the 'guide' to the curiosities of the place; namely, waterfalls without water, and hosts of other marvellous nothings. Then you must visit the bazaar, and, fascinated by the blandishments of the fair proprietress (oh the refinement of bucksheesh!) add your name to the raffle paper, and be too happy to purchase what she chooses to sell you at whatever price she chooses to ask. The poor Italian boy travels down hither from the great metropolis, as a locality likely to suit his purpose, or rather that of his tyrannical employer; and even the little urchins in the neighbourhood are on the *qui vive* as well as their elders, obtruding on your attention specimens of 'silver ore' found in the neighbourhood, offering to be your 'guide' to any neighbouring curiosity, or looking expectation while they hold open the gate for you to pass through. If you only whisper a word about an excursion, a dozen fly-boys, intent upon securing the job, collect round the door, noisily urging the pre-eminent merits of the establishment with which they are connected. In short, at fashionable watering-places, whether you eat, or drink, or sleep, or ride, or walk, or sail, or bathe, bucksheesh will haunt you as your shadow; and if, before setting out on your expedition, you put in your purse double the sum necessary for your reasonable expenses, you will be a fortunate man if you bring anything back.

Can the prevalence of bucksheesh be owing to anything in the social arrangements of England, not existing in other countries? Not unlikely. The American 'humbler classes' are proudly unconscious of the custom, and a servant there would regard as an insult the offer of one of those gratuities the withholding of which would here be so much resented. Even in Scotland, if we keep away from certain tourist-frequented parts of the Highlands, there is little of that constant out-looking for money gratuities which we always feel to be so annoying when we happen to travel southward. Perhaps the tendency of English institutions is to put the

humbler classes too much on a stipendiary footing, and thus accustom them to be constantly looking for money from everybody who appears with a good coat upon his back. Nor is this corruption so limited, for an idea is evidently prevalent amongst the middle and higher classes that money is the measure of all the desirables of life. We see it in the outcry made about every kind of merit if it happens to be connected with poverty, as if the first duty towards a more than usually deserving person were to cram money into his hand. Can we doubt for a moment that all such views and practices must tend to sink and extinguish in the breasts of a people, that self-respect which is the first principle of nearly all virtue?

BIOGRAPHIC SKETCHES.

JOHN DALTON.

THERE are some men whose lives form eras in history—points from which we date the onward progress of mankind in science and civilisation. Among these may be justly numbered John Dalton, the author and expounder of the Atomic Theory, by which chemical investigation has assumed the certainty of mathematical demonstration, and the determination of its results the simplicity of an arithmetical problem. The life of such a man, though in a great measure devoid of those incidents and adventures which commonly give zest to biography, cannot fail to be of interest to that public which reaps so directly the fruits of his labours; and for this reason we propose to draw from certain sources at our command* a brief sketch of his personal history, adverting, as we proceed, to the nature and value of his discoveries.

John Dalton was born at Eaglesfield, near Cocker-mouth, in Cumberland, on the 5th of September 1766. His father, Joseph Dalton, was originally a person of no property; but after the death of an elder brother, he became possessed of a small copyhold estate, which he farmed with the assistance of his sons. He had six children, of whom only three survived to maturity—Jonathan, John, and Mary. The first-named of these obtained the estate on the decease of his father, and retained it till his own death, in 1835, when it became the property of John. Though straitened in circumstances, old Dalton strove to give his family the best education within his reach, and the subject of our memoir attended a school conducted by a member of the Society of Friends, until he had attained his twelfth year. We have no means of knowing the nature or amount of the instruction which he received at this school—the only one he ever attended—but he is said 'to have made very considerable progress in knowledge;' and he always spoke with respect of his early preceptor.

That Dalton did make the progress here spoken of, and that he gave early proof of rare energy and natural capability, may be gathered from the fact, that at the age of thirteen he commenced a school in his native village, and persevered in teaching during two winters. So modest, unassuming, and conscientious a man as he proved himself in after life to be, must have been well assured, even at that early age, of the possession both of knowledge and of the power to impart it, or he would not have undertaken so difficult a task. How he pro-

spered in this vocation we are not told; but probably not greatly, for we learn that a considerable portion of his time was spent in assisting his father in the works of the farm. At this period his principal study was mathematics, in which he was joined by a youth in the service of a Mr Robinson, who, along with his lady, an accomplished woman, was instrumental in directing the pursuits of the young philosophers. An anecdote is told of the boy-teacher, which, though homely, exhibits the early possession of that confidence and self-reliance which in after years were prominent traits of Dalton's character. The correctness of one of his solutions being questioned, he promptly persisted in its accuracy, backing his opinion with a bet—the result of which was a supply of candles through the winter for his little school.

In 1781, at the age of fifteen, Dalton removed to Kendal, to officiate as usher in the boarding-school of his cousin George Bewley. Here he resided till 1792, actively engaged in learning and teaching mathematics and the physical sciences. During his residence in that town, he attracted the attention of Mr Gough, a blind gentleman, who, in spite of his misfortune, was devoted to the study of physics and natural history. This individual had an excellent library, and some apparatus, which he placed freely at the disposal of Dalton, who soon became his assistant and companion. The service required was of a light and pleasant description, and the blind philosopher, who was possessed of excellent natural abilities, and a liberal education, appears to have acted the kindest part towards his young friend, who, in return, was never weary of expressing his sense of obligation. When he published his Meteorological Essays, he said, in reference to Mr Gough—'If there be anything new, and of importance to science, embraced in this work, it is owing in great part to my having had the advantage of his instructions and example in philosophical examinations.' And although we may believe that Dalton's modesty led him somewhat to over-estimate his obligation to Mr Gough, there can be no doubt that one whose early education had been comparatively so neglected, must have derived the greatest benefit from intercourse with such a person as the latter is described to have been. During his residence at Kendal, and for some time after, we find Dalton frequently contributing answers to mathematical and philosophical questions which appeared in 'The Gentleman's and Lady's Diary,' a periodical then of some celebrity, but now little remembered. In 1788 he commenced his meteorological observations, which led directly or indirectly to all his great discoveries, and which were continued without intermission till the day before his death.

In 1793 Dalton gave to the public his first work, entitled 'Meteorological Observations and Essays,' to which more particular reference will be made hereafter. Some time previous to the appearance of that publication, he had thought of qualifying as a physician or a lawyer, and corresponded with a friend in London on the subject. But his views were changed in consequence of the receipt of a letter, by his friend Mr Gough, from Dr Barnes, making inquiry for a gentleman to fill the situation of professor of mathematics and natural philosophy in the New College, Mosley Street, Manchester. Dalton's offer to undertake the duties was accepted, and he removed in 1793 to Manchester, where he spent the remainder of his days. The year after settling in that town, he joined a society which had been established for some time, under the title of the Manchester Literary and Philosophical Society. To the transactions of this body—the most celebrated of all our provincial scientific associations—he contributed a series of papers containing the results of original researches of the highest value. These, along with a few others on kindred subjects, have

* The sources to which we refer are a manuscript original memoir, obligingly confided to us by its author, and an able and ingenious article on the Life and Discoveries of Dalton, in the opening number of the British Quarterly Review. This article—of which our sketch may generally be regarded as an abridgment—is from the pen of Dr George Wilson of Edinburgh, and is, in point of method and perspicuity, one of the most successful efforts in scientific biography which we ever had the pleasure to peruse.

onferred on the society's periodical publications, best known as the 'Manchester Memoirs,' a celebrity which as extended beyond the nations of Europe. Dalton resided for about six years within the Mosley Street Institution, and continued to officiate there till the college was removed to York in 1799, when he began to teach mathematics and natural philosophy privately, at the barge, it is said, of eighteenpence an hour. In this humble occupation he was engaged when, in 1804, he unfolded and expounded the laws which he had discovered to regulate the proportions in which substances combine chemically with each other, along with the hypothesis by means of which he accounted for their existence. The laws and hypothesis are generally, though erroneously, taken together, and included under the single title of his *Atomic Theory*.

Up to this period Dalton must be considered as a mathematician and meteorologist, rather than in the light of a chemical inquirer: his studies, however, were fast tending in the latter direction. He taught mathematics, and solved philosophical problems, successfully as regards abilities, but with little pecuniary profit. Indeed the appearance of an English grammar from his pen, in 1801, indicates rather necessitous circumstances; for, to judge from his general character, such a book is the last he would have composed as a matter of choice. This little work, which is now ill but unknown, is not without marks of a peculiar order and definiteness of expression, that exhibit the workings of an acute mathematical and mechanical mind. We do his intellectual powers no injustice when we thus characterise them, for he was almost totally devoid of literary tastes, and was one of the most limited readers, finding his pleasure in original physical observation and inquiry, and not in the discoveries and thoughts of others, however brilliant and enticing. As a meteorologist, his progress had been more successful: and this need not be wondered at, seeing that his mind was so peculiarly adapted for the frequency and regularity of bare observation which the science of the atmosphere requires. For more than fifty years of his life, he was in the habit of taking about a dozen observations daily, registering in all upwards of two hundred thousand independent notices; and it would have been remarkable if from this enormous field he had not deduced many laws practically as well as theoretically important. Of these discoveries, either published independently or in the Manchester Society's Memoirs, we can only give the merest abstract, extending as they do over a space of twelve or fourteen years—and those among the most active and vigorous of his existence.

His observations on the weight of the atmosphere led him to the discovery of the fact, that the rise and fall of the barometer depends upon the amount of watery vapour floating in the air; every grain of water, when dissolved in that medium, becoming an elastic vapour capable of sustaining 1-24th of an inch of mercury. He connected the aurora borealis with magnetic phenomena, and explained the cause of the trade-winds, without being aware of the explanations of others on these points. From 1794 to 1803, he was busily engaged with experiments and observations on such subjects as the fall of rain, the deposition of dew, the origin of springs, the power of fluids to conduct heat, the constitution of mixed gases, the force of steam, evaporation, and the expansion of gases by heat; all the while conducting his meteorological observations with the utmost regularity and minuteness. In this wide range of investigation his studies were chiefly physical, yet treading on the confines of chemistry, and leading him insensibly to connect chemical views with his mechanical hypotheses. In using a diagram of the atmosphere, for example, the particles of oxygen are represented by small diamonds, those of nitrogen by dots, those of carbonic acid by triangles, and those of aqueous vapour by asterisks; thus showing that, two years before he announced his Atomic Theory, Dalton had accustomed himself to look upon bodies as composed of molecules,

ultimate particles, or *atoms*, as he afterwards called them, and to consider the properties of the masses as dependent upon the manner in which their ultimate particles comported themselves to one another. In 1803 he published an essay 'On the Tendency of Elastic Fluids to Diffusion through each other,' and another 'On the Absorption of Gases by Water and other Liquids.' The latter contains the first announcement of his discovery of the laws of combining proportion, and the germ of his celebrated hypothesis. In discussing this matter, he employs his usual mode of illustration; namely, representing the particles of the liquids by one kind of dot, and the particles of the gases by another kind—thus showing the hold which a belief in the atomic constitution of matter had taken of his mind, and the use which he made of it in discussing purely physical problems, before he had occasion to apply it to chemical questions at all. It is needless to state that he took a mechanical view of the absorption of the gases by liquids. But if this mingling were a mechanical and not a chemical action, how does it happen that water dissolves its own bulk of one gas, carbonic acid, and only three per cent. of its own volume of another, such as oxygen? Dalton saw the difficulty, and devised a hypothesis to overcome it, which we give in his own words:—'Why does water not admit its bulk of every gas alike? This question I have duly considered, and though I am not yet able to satisfy myself completely, I am nearly persuaded that the circumstance depends upon the weight and number of the ultimate particles of the several gases; those whose particles are lightest and single being least absorbable, and the others more, according as they increase in weight and complexity.' To this there is a foot-note:—'Subsequent experience renders this less probable;' and the text is followed by a passage which we put in italics. '*An inquiry into the relative weights of the ultimate particles of bodies is a subject, so far as I know, entirely new: I have been prosecuting the inquiry with remarkable success.*' On the succeeding page is a table of the relative weights of the ultimate particles of gaseous and other bodies. This was the first attempt at a table of *atomic weights*; and though every one of them was wrong, with the exception of hydrogen, which he assumed as unity, one cannot regard it otherwise than with respect. Such, we believe, were the steps by which Dalton was conducted to the discovery of the laws which regulate the combining proportions of different bodies. He was testing by experiment the truth of a hypothesis as to the cause of the specific solubility of gases in water, which proved in the end quite untenable; but, like Columbus, who missed an Eldorado, but found an America, he discovered something better.

And what is this Atomic Theory? This is not the place to answer such a question in detail; but we may state shortly its nature and bearings. It supposes every known substance to be composed of indefinitely small particles or ultimate atoms, each atom being endowed with the weight, solidity, fluidity, colour, and other sensible properties of the mass to which it belongs. These atoms may or may not be in absolute contact, but may each be surrounded by an atmosphere of heat, electricity, &c.; they may be of different shapes and sizes, and must necessarily be of different weights or densities, according to the nature of the body of which they are the constituents. We do not know what may be the *absolute* weight of an atom of any elementary body, whether it be the millionth or the ten-millionth part of a grain; all that the chemist knows and proceeds upon is the *relative* weights, assuming some one as a standard. Dalton took as his standard the atom of hydrogen, which is the lightest known body: this he called 1; and as a given weight of hydrogen always requires eight times as much of oxygen to form water, he drew the certain inference, that the atom of oxygen was to the atom of hydrogen as 8 to 1. Again, olefiant gas consists of hydrogen and carbon; namely, one part of the former to six of the latter: therefore the carbon atom must be represented

by 6. Proceeding upon this method, the relative weights of all the known elements were determined—hydrogen 1, oxygen 8, carbon 6, nitrogen 14, silver 108; gold 199, &c.—and a table constructed, in which these proportions were set down for future guidance. According to Dalton's hypothesis, then, the proportions in which bodies combine with each other are supposed to depend upon the weights of the atoms that make them up, and to be identical with them. By this view, when bodies combine together, their ultimate particles do not interpenetrate, or become fused together, so that the individuality or identity of any is lost. The atoms only come in close proximity, and lie side by side, or above and below each other; and when the compound they form is decomposed, they separate and reappear with all their original properties. The smallest possible quantity of water is in this way conceived to consist of one atom of hydrogen and one of oxygen, bound together without loss of the individuality of either, by the unknown and invisible tie which we term chemical affinity. We shall see how aptly the atomic hypothesis explains all the laws of combining proportion, on which the science of chemistry depends.

The first great law is, that the same compound consists invariably of the same components. Water, for example, always consists of oxygen and hydrogen; common salt of chlorine and sodium; vermilion of sulphur and mercury. Indeed this is a fundamental law of nature, and one upon which the other chemical laws are based. The second teaches that the elements which form a chemical compound are always united in the same proportion by weight. Water not only consists invariably of oxygen and hydrogen, but the weight of oxygen present is always eight times greater than that of hydrogen. It is the same with every compound: common salt always contains 35 parts of chlorine to 22 of sodium; vermilion 16 of sulphur to 101 of mercury. The third law enforces the remarkable truth, that when one body combines with another in several proportions, the higher proportions are multiples of the first or lowest. Thus 8 of oxygen and 1 of hydrogen form water; and 16 of oxygen and 1 of hydrogen a substance called the peroxide of hydrogen. Here the 16 is twice 8, or a multiple of the first or atomic weight of oxygen. Again, oxygen is found to unite with nitrogen in 5 different compositions, each union forming a different substance. These proportions are 8, 16, 24, 32, and 40, to 14 of nitrogen. Here also we have not $8\frac{1}{2}$, or $16\frac{1}{2}$, or 19, but a regular multiple of 8, or the lowest atomic weight of oxygen; and necessarily so, since atoms are regarded as the ultimate units or entreties of matter. We can conceive 2, or 16 atoms of oxygen, uniting with 1 atom, or 14 of nitrogen; but not of $2\frac{1}{2}$, otherwise there were no faith to be placed in the theory of atoms being the ultimate particles of matter. The fourth law is to the effect, that if two bodies combine in certain proportions with a third, they combine in the very same proportion with each other. Thus 16 parts of sulphur combine with 8 of oxygen, and 27 parts of iron combine with 8 of oxygen; therefore 16 parts of sulphur must be the quantity that combines with 27 of iron, as may be verified by experiment. This law is of the utmost practical value to the chemist; but for its existence, his labours as an analyst would be endless, and the work of a lifetime would go but a short way in ascertaining the combining proportions of a single substance. As it is, however, if the proportion be ascertained in which one body combines with any other, the proportion in which it will combine with every other may be ascertained, not by analysis, but by simple calculation. The fifth law is that which teaches that the combining proportion of a compound body is the sum of the combining proportions of its components. The combining proportion of water, for example, is found to be 9, or a multiple of 9; but this number is the sum of its constituents, 8 oxygen and 1 hydrogen. So with every other. The equivalent of carbonic acid is 22, which is just the sum of 16 oxygen and 6 carbon of which it is composed.

Such are the laws which regulate the deductions of the chemist, and which are all beautifully and intelligibly explained by the hypothesis of Dalton. We have only to gain a perfect conception of the atomic constitution of nature, and the innumerable combinations, separations, and recombinations of matter appear before us in naked and unalterable simplicity. It is true that some of these laws were known and acted upon by chemists before the time of John Dalton; but he may be justly said to have discovered all of them for himself; and even if he had not, he had at least the merit of lighting them up anew, and concentrating their energies to the elevation of chemistry, from the state of an empirical art to that of an inductive science.

The first glimpse of the Atomic Theory, as has been stated, was obtained by Dalton in 1803. In 1804 he touched upon it in his lectures in Manchester, and at the Royal Institution of London; and in the same year he explained it to Dr Thomson of Glasgow, who spent a day or two with him in Manchester. By the latter chemist, and not by Dalton himself, it was first explicitly made known to the world, in 1807, in the third edition of his 'System of Chemistry.' In the same year Dalton explained his views in the course of lectures which he delivered in Edinburgh and Glasgow; but it was not till 1808 that he fully expounded them in his well-known work entitled, 'New System of Chemical Philosophy.' Between the years 1803 and 1810, Dalton was chiefly occupied in the prosecution of analyses to verify his theory, in teaching mathematics, and in delivering lectures before the mechanics' institutions of the principal towns. He was not a fluent speaker, nor had he any great talent for teaching. He declined, however, all the offers made by his friends to provide him with a competency, so that he might devote his undivided attention to scientific pursuits. To such overtures he replied, 'that teaching was a kind of recreation, and that, if richer, he would not probably spend more time in investigation than he was accustomed to do.' For many years he had the usual fate of the prophet, and received 'no honour in his own country.' He had always around him in Manchester, however, a small circle of appreciating friends, who did all they could to extend his fame. In 1814 they had his portrait taken by Allen, and an engraving made from it for distribution. In 1817 they conferred on him a further mark of their esteem, by electing him president of the Literary and Philosophical Society, of which he had long been the most distinguished member; and he had the honour of being re-elected every year till his death. In 1822 he visited Paris, and during his sojourn there was introduced to La Place, and to all the more distinguished French philosophers; invited to attend the meetings of the institute; and treated both in public and private as one whom all delighted to honour. The generous appreciation of his merits shown by the French, as contrasted with the indifference exhibited by all but his personal friends, and a few men of science at home, made a strong impression on Dalton. Although a man of few words, little given to betray his feelings, and very indifferent to applause, he was so moved by his reception, as to say when he returned home—'If any Englishman has reason to be proud of his reception in France, I am that one.'

At length his countrymen became more alive to his merits; and for the last ten years of his life Dalton was the object of universal esteem. In 1826, the council of the Royal Society of London unanimously awarded to him the royal gold medal of fifty guineas' value, placed at their disposal by George IV. It is to the British Association for the Advancement of Science, however, that Dalton was indebted for the respect in which latterly he was held. He attended its earliest meeting at York in 1831, where he was seen for the first time by many who had long esteemed him at a distance, and now rejoiced in an opportunity of vying with each other in showing him respect. At the next meeting of

the association, held at Oxford in the following year, the university conferred upon him the title of Doctor of Civil Law. In 1833, when the association met at Cambridge, the president, Professor Sedgwick, took a public opportunity of expressing his regret that the university could not honour herself, as the sister one had done, by conferring upon Dalton an honorary degree, as these cannot be granted without royal mandamus. At the close of his speech, he announced 'that his majesty, King William IV., wishing to manifest his attachment to science, and his regard for a character like that of Dr Dalton, had graciously conferred on him, out of the funds of the civil list, a substantial mark of his royal favour.' This 'substantial mark' was a pension of £150, which was raised to £300 in 1836.

In the same year, 1833, a number of his friends subscribed the sum of £2000, and employed Chantrey to execute a full-length statue of him in marble, which is now erected in the entrance hall of the Royal Manchester Institution. While in London giving the requisite sittings for his bust, he was most cordially welcomed by men of science; and through the influence of Mr Babbage the mathematician, of Lord Brougham, who was then chancellor, he was introduced to his late majesty, William IV. In 1834 he attended the meeting of the British Association at Edinburgh, where every sort of kindness and new honours awaited him. The university conferred upon him the degree of LL.D., the royal society elected him a member, and the town council presented him with the freedom of the city. In 1835 he was present at the Dublin meeting of the association, where all parties, from the lord-lieutenant downwards, vied with each other in extending to him the marks of their esteem.

'We have now,' says Dr Wilson, 'reached the 70th year of his laborious career, and it will not surprise the reader that the silver cord should be beginning to be loosed, the golden bowl to be broken at the fountain. In 1837, when in his 71st year, he suffered from a severe attack of paralysis, which left his right side powerless, and also deprived him of speech. He experienced a second slight attack on the 21st of the same month, and for some time both his mental and bodily faculties appeared to be much affected. After an illness of some months, however, his health improved, and his mind began to evince something of its former vigour, though his articulation always remained less distinct than before. On the 17th of May 1844 he had a third paralytic stroke, which partially deprived him of the use of his right side, and increased the indistinctness of his utterance. He recovered in some degree from this attack also, and on the 19th of July 1844, was present at a meeting of the council of the Manchester Literary and Philosophical Society, where he received an engrossed copy in vellum of a resolution of that society, passed at its annual meeting, recording "their admiration of the zeal and perseverance with which he has deduced the mean pressure and temperature of the atmosphere, and the quantity of rain for each month and for the whole year; with the prevailing direction and force of the wind at different seasons in this neighbourhood, from a series of more than two hundred thousand observations, from the end of the year 1793 to the beginning of 1844, being a period of half a century." Dalton received the resolution sitting, and being unable to articulate a reply, handed a written one, which was read by his old and attached friend, Peter Clare, Esq. This was the 19th of the month—on the 27th Dalton was no more!

'The news of Dalton's death, although it must have been looked for by many, was heard with sorrow throughout the whole length and breadth of the land. His townsmen, anxious to express their sense of the irreparable loss they had sustained, resolved to give him a public funeral, which accordingly took place, attended by thousands, on the 12th of August. His remains were interred in the cemetery at Ardwick Green.

'In stature, Dalton was about the middle size, of strong rather than of elegant proportions. The likeness

between his head and face and those of Newton was often observed during his lifetime, and is said to have become more striking after death. Till his seventieth year, he enjoyed robust health; and he was all his lifetime fond of exercise in the open air. He made a yearly journey to his native mountains of Cumberland and Westmoreland, and climbed Helvellyn, and often also Skiddaw. He was very methodical and regular in his habits. The afternoon of every Thursday he spent at a bowling-green, where he could join with some congenial associates in a turn at the old English game of bowls. He was equally regular in attending the meetings of the Society of Friends, at which he was present twice every Sunday. On the same day he was in the habit, for more than forty years, of dining at a friend's house; and even when the family were absent, he paid his accustomed visit.

'In endeavouring to form a conception of his mental peculiarities, we shall be assisted by comparing him with some of his great fellow-chemists. The labourers to whom chemistry has been indebted for its greatest advances, admit of a natural division into two great classes. The one of these, and by far the smaller, contains men possessed of enthusiastic, imaginative, poetical temperaments, of sanguine, hopeful spirits, and great rapidity, subtlety, and comprehensiveness of mind. Such pre-eminently was Davy; such is the great living chemist Liebig; and if we accept a very subtle fancy instead of a far-stretching imagination, such, too, was Priestley. The other and larger class consists of men in whom the poetical element was at a minimum, who were characterised by great patience, self-concentration, and perseverance in thinking; for whom the working motto was, "Non vi sed sepe cadendo;" and in whom great self-possession and self-reliance were strongly developed, producing indifference to the opinion of others, and, in extreme cases, an almost repulsive hardness, sternness, and severity of character. To this class belong Black, Cavendish, Wollaston, Bergman, Scheele, Lavoisier, Dalton, and, if we include the living, and confine ourselves to our own country, Faraday, Graham, and Thomson. Thinkers of both these classes have done, and will yet do, excellent service to chemistry. We sum up their peculiarities in a word, if we say, with the late Dr Henry, that the great object of the first class is to discover truth; of the second, to avoid error.

'Such was Dalton; a simple, frugal, strictly honest, and truthful man. For the independence, gravity, and reserve of his character, he was doubtless much indebted to his birth as a Cumberland yeoman, and his long connexion with the Society of Friends. The individuality of his nature showed itself in his great mathematical capacity, his thorough self-reliance and power of patient, persevering work, the native clearness of his intellectual perception, and the extraordinary power of fearles generalisation which he brought to bear upon what nature unfolded to him. In the latter quality, in particular, he excelled every one of his scientific contemporaries.

'The inhabitants of Manchester have announced their intention of erecting a monument to Dalton's memory. We trust that the proposition of founding a chair of chemistry, especially for the exposition of chemical atomics, will take the precedence of every other, as the best means of carrying out that intention. Every one, we think, must feel that bronze statues, or other costly erections, would be altogether out of keeping with the character of the plain Quaker man of science. A "Dalton" chair of chemistry, on the other hand, would be a fitting memorial, and in conformity with the wishes of him* whom it is intended to honour. We offer these suggestions with all deference to those who seek, by some befitting token, to keep before us the memory of Dalton, because we should grieve to

* Dalton, it is well known, left the sum of £2000 to endow such a chair at Oxford; but revoked it before his death, with the view, it is believed, of giving the money to friends who had assisted him in his early days.

think that a great sum of money had been spent for this purpose in vain. So far as he himself is concerned, we have no fear. Dalton will never be forgotten. He is the second Newton of English physics, and will go down to posterity along with the first.

DUTY—A TALE.

TRANSLATED FROM THE FRENCH.

DISPLEASURE was strongly marked on the habitually placid features of Monsieur Dormans. His wife was busily engaged in some household duty, but he neither noticed her, nor made any of his usual inquiries or remarks concerning the events of the past day. Victoire, his daughter, and Louise, his niece, were each embroidering a black lace veil by the light of a small lamp. Victoire's eyes were often raised to the lamp, as if intrusting it to give more light: Louise was less engrossed by her work; she seemed to be anxiously expecting some one, for whenever a step was heard on the stairs, she turned eagerly towards the door, and as the steps passed on, stole an uneasy glance at her uncle's troubled countenance.

This scene was passing at Lyons, in the Rue des Augustins. The clock of St Louis's church struck nine. M. Dormans wound up his watch, paced the room impatiently for some minutes, and then asked if supper was ready. On Madame Dormans observing that it would be served in a quarter of an hour, he replied, 'Say rather we must wait a quarter of an hour longer for Mr Edward; where can he be at this hour?'

'Promise me not to be angry with him?' said the mother imploringly, as she approached her husband.

'I shall promise nothing,' he replied sternly; 'why is he not at home?'

'You are too severe upon him, my dear; young men will naturally seek amusement. He is gone to the theatre to see—'

The steady piercing look of the father so disconcerted the poor mother, that she was forced to apply to Louise for the name of the piece: it was the *Huguenots*.

'And where does he find means to pursue these pleasures, he who gains nothing?' asked M. Dormans sternly. 'Who has supplied him with money to go to the theatre? Doubtless his sister or his cousin, from their little earnings?'

'His pleasures are so few,' urged the mother.

'Are mine more numerous?'

The father's displeasure threw a gloom over the supper; it was eaten in silence; and all but M. Dormans retired soon after. Edward came in at eleven.

'I have been waiting for you, sir,' said his father.

The young man endeavoured to excuse himself.

'Your employers are dissatisfied with you; they have complained to me to-day of your negligence and incapacity.'

'I have no taste for measuring cloth all day long,' said Edward sullenly.

'Desjardins is my intimate friend, and your mother's relative; he will promote you. As soon as you have proved yourself competent and trustworthy, he has promised to give you a situation worth from two to three thousand francs a-year.'

'I have an unconquerable dislike to trade. For the last twelvemonth I have been learning to manufacture cloth, and during the whole of that time have been a prey to sorrow and disgust.'

'That is to say, you would rather be idle?'

'I should like to work at my own time and pleasure; to be at liberty to walk out when the weather invites me, and to be no longer a slave.'

'For forty and six years,' said the old man gravely, 'have I reckoned figures before a grated window, into which the sun never shines, and I have never asked for a more agreeable occupation.'

'You were perhaps fond of arithmetic, father?'

M. Dormans looked at his son with ill-suppressed anger as he replied bitterly, 'I also loved pleasant walks and sunshine; but duty forbade the indulgence of these relaxations, and I obeyed. It was not by enjoying the fresh air, and lounging under the trees through the warm summer days, that I was enabled to keep you at school so long. Your mother wished you to have a better education than your father, and what is the result? The ignorant father must toil for the learned son. Absurd vanity! What is the use of your knowledge, if it cannot teach you to maintain your place in society? I am sixty-five years old, and for fifty-five of those years I have been indebted solely to my own exertions for support. When about ten years of age, on returning from school one day, I found my mother weeping bitterly. She had made up a small parcel of some of her wearing apparel, and was going out to sell it. "Do not sell it, mother," I cried; "but tell me what I can do for our support." "Alas! my child, you are too young," she said. "I love you," was my reply; and the following day I obtained employment, and gained more than any other boy of my age.'

'But, father,' said Edward, somewhat abashed, 'I do not dislike work; I only ask a profession that I can like.'

'And what would you wish to be?'

'An artist, father. I have painted in secret for a long time, and my endeavours were favourably received at the last exhibition. That is the path of life to which I am destined; I can apply to nothing else.'

'You wish to be admired and spoken of,' said M. Dormans severely; 'and you mistake your foolish vanity for genius. You neither possess the perseverance nor the ardour requisite to make a good painter, and never, with my consent, shall you embrace that profession.'

These discussions were often renewed, but neither would yield to the other. The father remained inflexible, and the young man continued to neglect his commercial duties for the indulgence of his favourite pursuit. This struggle between father and son threw a shade of sadness over the little household; but none felt it so acutely as Louise, Edward's cousin. They had been brought up together; and Madame Dormans, in conversation with the young girl, had often alluded to the probability of a union between them, so that Louise had gradually accustomed herself to look upon Edward as her future husband. She became of age, and M. Dormans, with his accustomed scrupulous exactitude, gave his accounts into her hands, and placed her little fortune of thirty thousand francs at her own disposal. The same evening Edward found the entire sum in his desk, with the following note:—

'This sum will enable you to go to Paris to complete your studies as an artist, and take the place to which your talents entitle you. Accept it as a loan from a friend, and make her happy by seeing you so.'

Edward was at no loss to discover from whom the money and note had come. He loved Louise sincerely, and it was his dearest wish to be one day united to her; but the uncertainty of his present position had hitherto forced him to be silent on that subject. Now, however, he hastened to the parlour, where he found the young girl alone; and tenderly embracing her, exclaimed, 'I accept

it, Louise, on the condition that you will accompany your husband to Paris!

A month afterwards the young couple arrived at the great metropolis, where Edward hoped to follow his chosen profession with success, having now no one to oppose his inclinations. Landscapes and flowers were the branches of the art to which he had specially devoted his attention, and he began to work with ardour, in hopes of proving to his father, by prompt and brilliant success, the injustice of his opposition, and the failure of his predictions.

But, alas! success did not come so rapidly as his sanguine aspirations had led him to expect: his ardour soon began to abate, and ere long he had returned to his former careless and indolent habits. Louise vainly endeavoured to discover the cause of the alteration in her husband. If she hazarded a gentle remark on his inactivity, he found fault with his colours, with the light, with the noise from the street; with everything, in fact, but the only true fault—his inconstant and yielding nature. The freshest flowers faded in the water in which he had placed them, before he had even sketched their outlines, and then he murmured at the evanescent nature of his models. His easels were always covered with be-daubed canvases; for no sooner was a painting begun, than he abandoned it for something new; and it was seldom that he finished anything. His fondness for walks and amusement soon returned: he spent whole days lounging about the public galleries and gardens; dreaming of fame, but too indolent to pursue the road which led to it. This unprofitable manner of spending his time gave him occasionally some remorse; but he had not sufficient moral courage to keep his resolutions of amendment. He retired to rest at the close of each day regretting the ill use he had made of it, and wishing and intending to do something on the morrow. But when it came, he was as little disposed to work as before: his head was heavy; his mind void of enthusiasm; he 'wanted inspiration,' he said; and, as usual, went to seek it in the streets of the metropolis, or in its beautiful environs. The fruitful inspiration did not come, and another day was spent as vainly as the last. The search for a fine subject absorbed his attention for a long time; and when at length he thought he had succeeded in finding one, he took up his pencils and began to work with some degree of enthusiasm. But the exhibition was at hand; he became frightened at the few days that remained; the painting, well begun, became a task, and his conceptions of the beautiful and sublime were swallowed up in the absolute necessity of haste.

'It was thus the great Rubens painted,' said he, by way of comforting himself, and reassuring his wife. 'A patient execution, and an exquisite finish, are only for inferior minds. Genius prompts a rapid flight with daring sublimity.'

With these sentiments the painting advanced rapidly, and was finished in time. The first day the Louvre was opened to the public, Edward hastened thither, expecting to see his picture in one of the most conspicuous places. But he sought it in vain; his grand production had been refused! Some artists of merit had met with the same affront through prejudice, and Edward, numbering himself among these distinguished victims, consoled himself with the reflection, that it was frequently the fate of genius to be unappreciated. It was, nevertheless, a severe blow, and discouraged him not a little. Unfortunately, he attributed his failure partly to the comparative obscurity of his life, and resolved to visit more, and to form acquaintance with artists of note. This was a new mode of dissipation; and as Louise had become a mother, and could not leave her child, he soon acquired the habit of leaving her alone. The affectionate and inexperienced young wife could not think her husband to blame. She never complained of his long and frequent absence, for fear of grieving him; and then he was so kind and gentle towards her, so attentive to all her wants; he apologised for leaving her so much alone with such apparent sorrow, representing to her how

necessary it was that he should use all his endeavours to succeed in his profession, Louise had not the heart to chide, or even to think herself unhappy.

Three years passed away. Another infant had come to increase the expenses of the little household: the greater part of Louise's little fortune was spent: she began to think of the future with dread, and communicated her anxiety to her husband.

'You are in the right, Louise,' said he. 'I really must do something. I have wasted time enough in unprofitable visits and amusements; but a painter's life, you know, cannot resemble that of a clerk; it is a life of passion and irregularity. An artist may be months without touching the pencil, but a few weeks' work will often amply atone. And, after all, I cannot think I have been altogether idle; I have a dozen subjects in my head that only want working out. I muse upon them in the crowd; I dream of them at night.' Produce them, then, Louise might have said; but she was silent. 'I only ask,' continued Edward, 'a few more days of relaxation and enjoyment before I shut myself in my study, and devote my whole time and attention to these great subjects.'

Three weeks from that time he felt the absolute necessity of a pleasure tour. 'Nature called him,' he said; 'he was weary of the world, of noise and bustle. He wanted to see the ocean, and seek inspiration in its grandeur and sublimity.' Louise bent her head over her baby's face to conceal a tear.

When Edward returned, his wife requested to see his sketches and studies from nature. He had nothing to show: one day the fine weather, and another the rain, had prevented him from doing anything.

'I have produced nothing apparent, it is true,' said he in some confusion, 'but I have done a great deal interiorly; my head and imagination are stored. We artists, even in our repose, are progressing towards fame; but pray do not torment me with your puerile fears, or all the inspirations of genius will vanish.' Louise said nothing, but her eyes were opened; and when her husband delayed the commencement of a painting till *to-morrow*, she sighed or smiled sorrowfully. At the same time, she did all in her power to retard the poverty he was preparing for them. She discharged her maid, under the pretence that she did not suit her; and did all the household work herself, besides attending to her little ones. She sat sewing beside them during the long winter evenings, until the night was far advanced, with one candle and no fire; and ere long, these watchings and anxieties produced their usual effect—her cheek paled, and her eye lost its brightness; she daily became more weak and languid, until at length she herself began to be frightened at her condition.

And Edward still continued to trifle away his time among companions as idle and thoughtless as himself, and was only roused from his indifference by the intelligence that a very small sum remained of Louise's money. This startled him. He shut himself determinedly in his study, and finished two or three paintings, that were not refused this time. His wife had witnessed the change with joy; and ill as she was, resolved upon accompanying him to the Louvre, to view his productions, and enjoy the admiration he expected they would excite. But, alas! they were obscurely placed, and all the notice they attracted was a cursory glance. Near the best of them, however, the young couple saw with delight two gentlemen, one of whom was a noted artist, and the other a well-known connoisseur, whose word was law. They stopped to examine the painting, and Edward and his wife approached to hear their opinion and judgment. 'Only look,' said the connoisseur, 'at the aloofness and incorrectness of that piece. It is not a picture; it can hardly be called a sketch; everything is wanting but presumption.'

'What is chiefly wanting,' observed the painter, 'is the creative power. The painter is evidently one of

those young upstarts who can talk a great deal, but is incapable of performing anything, and who has nothing of the artist but his aspirations. His hundredth piece will be like this—it will be a crude idea, but never a picture. He was not born for an artist.'

'That is evident,' returned the connoisseur, and they passed on.

Edward remained pale and motionless. 'They are mistaken, love,' whispered Louise.

'I fear not,' said he, humbled and despairing; 'all they have said is true, quite true: I see it now. That painting is cold, senseless. I could trample it under my feet!'

'Edward,' said Louise imploringly, 'be calm, I intreat you, and if you have been mistaken, remember we are still with you—I and your children.'

The conversation at the Louvre was for Edward a ray of light. He began to doubt his talent for painting; but, alas! this was only another motive for inaction. Incapable of acting with resolution, and seeking the end of life, not in the fulfilment of duty, but in self-gratification, he abandoned himself to discouragement and despair. Louise's health continued to decline, and resolving to know the worst, she sent for a noted physician, at a time when she knew her husband would be absent. She explained every symptom, answered all his questions, and then, looking earnestly at him, intreated him to tell her candidly if it was possible for her to recover.

'It is possible, madam,' coldly replied the physician; 'your disorder has not reached the last stage; but you must obey my directions implicitly.'

'What are they?'

'Absolute rest, no watching, and, above all, no painful emotions.'

Louise burst into tears, and exclaimed, 'My children must then be orphans, for none of this is permitted or possible.'

The physician bowed gravely, and withdrew. As the door closed upon him, that of the study opened, and Edward entered in tears.

'No, dearest, our children shall not be orphans,' he said, tenderly embracing his wife; 'I was there and heard all. Can you forgive me, Louise? I have been an egotist and a coward!'

Louise started.

'Yes, a coward,' he continued; 'for I have done nothing to maintain mine own. I have not had the virtue of the meanest journeyman of our street. But tranquillise yourself, love; from this day I have found my true place, and shall, I hope, keep it;' and again embracing his wife, he went out.

Louise was glad to see a change in her husband, but uneasy about his present projects. She, however, waited patiently for him till the evening was far advanced. Still he did not return, and she began to be terrified lest some evil should have befallen him. The night was dark and stormy; heavy drops of rain began to fall; the dark waters of the Seine rolled sullenly along. A kind of delirium seemed to have seized upon the young wife. Overcome by her undefined apprehensions, she went from her sleeping children to the window, and from the window to her children, her hands joined in supplication, and asking nothing but her husband's return. At length she fancied she saw him coming along the dark street, and, without waiting to hear him knock, flew to the door, opened it, and exclaiming, 'Thank God, you are safe!' fell fainting into his arms. She soon, however, returned to consciousness; and her husband, after soothing her over-excited feelings, told her that, having heard that M. Duteuil, the rich manufacturer of Lyons, was in Paris, he had gone to seek him. Louise's eyes asked the reason. 'See,' said Edward, showing her a paper, 'this is the contract by which I have engaged myself as designer in his establishment.'

'Ah, now I am convinced that you love me!' exclaimed Louise, embracing her husband.

'My dreams of fame are over,' continued the young

man; 'I understand at length that the law for each is to make inclination yield to duty and circumstances; and you, Louise, shall not fall a victim to your husband's unpardonable indolence.'

Edward returned to Lyons, fulfilled the duties of his new situation diligently, and made his wife happy.

CURIOSITIES OF HERALDRY.

MR M. A. LOWER, whose treatise on surnames we formerly introduced to the reader's notice (vol. xi. p. 283), has published a new work under the above title,* which we find to be not less curious and amusing in its details. His panegyric on heraldry we entirely pass over: enough for us is the fact, that the most refined portion of the European community have, during several ages, found in this science a solace for their best aspirations, and that it has consequently become a portion of the history of civilisation. The custom of expressing characters and pretensions emblematically in fashions of clothes and arms, and figures borne upon both, seems to have taken its rise in Germany during the century preceding the conquest of England by William of Normandy. It assumed a fixed character in England about the reign of Richard I., who appears on his great seal of date 1189, with two lions combatant on his shield. The Crusades added to its stock of emblems; and by the time of Edward I., 'we find that all great commanders had adopted arms, which were at that date really *coats*, the tinctures and charges of the banner and shield being applied to the surcoat or mantle, which was worn over the armour, while the trappings of horses were decorated in a similar manner.' 'In the succeeding reigns,' says Mr Lower, 'the science rapidly increased in importance and utility. The king and his chief nobility began to have heralds attached to their establishments. These officials, at a later date, took their names from some badge or cognizance of the family whom they served, such as Falcon, Rouge Dragon; or from their master's title, as Hereford, Huntingdon, &c. They were, in many instances, old servants or retainers who had borne the brunt of war, and who, in their official capacity, attending tournaments and battle-fields, had great opportunities of making collections of arms, and gathering genealogical particulars. It is to them, as men devoid of general literature and historical knowledge, Mr Montagu ascribes the fabulous and romantic stories connected with ancient heraldry; and certainly they had great temptations to falsify facts, and give scope to invention, when a championship for the dignity and antiquity of the families upon whom they attended was at once a labour of love and an essential duty of their office.'

In time, armorial bearings and devices spread far beyond men of the sword. Every peaceful bourgeois corporation had its 'arms': even monasteries and ladies were thus decked out. We have ourselves recollections of shopkeepers' signs in country towns adorned with the emblems thus spoken of by our author:—'Persons of the middle class, not entitled to coat-armour, invented certain arbitrary signs called MERCHANTS' MARKS, and these often occur in the stonework and windows of old buildings, and upon tombs. Piers Plowman, who wrote in the reign of Henry III., speaks of "merchauntes' markes ymedeled" in glass. Sometimes these marks were impaled with the paternal arms of aristocratic merchants, as in the case of John Halle, a wealthy wool-stapler of Salisbury, rendered immortal by the Rev. Edward Duke in his "Prolusiones Historice." The early printers and painters likewise adopted similar marks, which are to be seen on their respective works. A rude monogram seems to have been attempted, and it was generally accompanied with a cross, and occasionally a hint at the inventor's peculiar pursuit. The heralds objected to such marks being placed upon a shield; for, says the writer of Harl. manuscript, 2252

* London: John Russell Smith. 1845. 8vo. pp. 390.

(ful, 10), "THEY BE NONE ARMYs, for every man may take hym a marke, but not army without a herawde or purveyaunte;" and in "The duty and office of an herald," by F. Thyane, Lancaster Herald, 1605, the officer is directed "to prohibit merchants and others to put their names, marks, or devices in escutcheons or shields, which belong to gentlemen bearing arms, and none others."

We have from Mr Lower a long chapter on heraldic charges, enumerating the many various objects thus employed. Among them are both reptiles and insects, not excluding the toad and gadfly. "Such was the taste for allusive arms, that the Botreuxes of Cornwall relinquished a simple ancient coat in favour of one containing three toads, because the word "botru" in the Cornish language signified a toad." Another chapter enumerates the many chimerical animals, as the unicorn, dragon, griffin, cockatrice, wyvern, which figured upon coats armorial, and as supporters. "The unicorn of antiquity was regarded as the emblem of strength and the guardian of chastity. His horn was a test of poison, and in virtue of this peculiarity the other beasts of the forest invested him with the office of water-"conner," never daring to taste the contents of any pool or fountain until the unicorn had stirred the waters with his horn, to ascertain if any wily serpent or dragon had deposited his venom therein. Upton and Leigh detail the "wonderful art" by which the unicorn is captured. "A mayde is set where he haunteth, and she openeth her lappe, to whome the Vnicorne, as seeking rescue from the force of the hunter, yeldeth his head, and leaneth all his fierceness, and resting himself vnder her protection, asleppeth vntyll [he] is taken and slayne!" The Hebrew *reem* being rendered in our version of the Bible unicorn, has confirmed the vulgar notion that the animal intended was the cloven-hoofed and single-horned figure of heraldry. But there is nothing in the word sanctioning the idea that the animal was single-horned; and on referring to the passages in which the term is introduced, the only one which is quite distinct on this point seems clearly to intimate that the animal had two horns. That passage is Deut. xxxiii. 17. "His horns are like the horns of the reem;" the word here is singular, not plural, and should have been "unicorn," not "unicorns," in our version. It has lately been attempted to prove that the reem of Scripture was the animal now known as the nyh-gau. Leigh declares the unicorn of our science to be a mortal foe to elephants, and such, according to zoologists, is the character of the rhinoceros. These two are, however, the only points of resemblance; for, while the unicorn of heraldry is of light and elegant symmetry, the rhinoceros of the African deserts is an animal so clumsy and ponderous, that it has been known to require eight men to lift the head of one into a cart."

Allusive arms are elaborately treated by our author. He gives lists of the most curious—as *Wolseley*, a wolf's head; *Foulis*, three leaves (*feuilles*, Fr.); *Fraser*, three strawberry leaves (*fraises*, Fr.); *Wylie*, a fox; *Trotter*, a horse, &c. He then comes to crests and badges, on which he is most learned. "Badges are a kind of subsidiary arms used to commemorate family alliances, or some territorial rights or pretensions. Sometimes, also, and perhaps more generally, they serve as trophies of some remarkable exploit achieved by an ancestor of the bearer. In the feudal ages, most baronial families had their peculiar badges, and their dependents were recognised by having them embroidered upon their sleeves or breasts. They were generally placed upon a ground tintured of the livery colours of the family. Something analogous to this fashion is retained in the crest which adorns the buttons of our domestic servants, and still more so in the badges by which the firemen and watermen of London are distinguished. Badges were also employed in various other ways; as, for example, on the furniture of houses, on robes of state, on the caparisons of horses, on seals, and in the details of Gothic edifices. An instance of the various applications of the badge of one noble family has been familiar to me from

childhood—the Buckle; the badge assumed by Sir John de Pelham in commemoration of his having been principally concerned in the capture of John, king of France, at the battle of Poitiers. This trophy occurs as an appendage to the family arms, into which it is also introduced as a quartering; on the ecclesiastical buildings, of which the family were founders, or to which they were benefactors; on the architectural ornaments of their mansions at Laughton, Halland, &c.; on ancient seals; as the sign of an inn near their estate at Bishopstone, &c.; and among the humbler uses to which the buckle has been applied, may be mentioned the decoration of the cast-iron chimney-backs in the farmhouses on the estate, the embellishment of milestones, and even the marking of sheep. Throughout the whole of that part of eastern Sussex over which the Pelham influence extends, there is no "household word" more familiar than the PELHAM BUCKLE."

It is uncertain as to mottoes whether they arose from the pious expressions placed in ancient times upon tombs, as DREDD GOD, JESU MERCY, LADY HELPE, or from war-cries used for mutual encouragement at the moment of onset, of which the following are specimens:—The king of France, 'Montjoye St Denis!' The king of Scots, 'St Andrew!' The emperor of Germany, 'A dextre et a sinistre!' They are classed as enigmatical, sentimental, and emblematical. According to Mr Lower, 'The enigmatical are those whose origin is involved in mystery, as that of the Duke of Bedford, 'Che sara, sara'—What will be, will be; and that of the Duke of Bridgewater, 'Sic donec'—Thus until—! A late barrister used 'Non bos in lingua'—I have no bull upon my tongue; alluding to the Grecian didrachm, a coin impressed with that animal, and expressive, probably, of the bearer's determination not to accept a bribe. The motto of the Lords Gray was, 'Anchor, fast anchor;' and that of the Dakynses of Derbyshire, 'STRIKE DAKYNS; THE DEVILS IN THE HEMPE'—enigmatical enough certainly.

'Sentimental mottoes are very numerous. A multitude of them are of a religious character; as 'Spes mea in Deo'—My hope is in God; 'In Deo saltem'—In God I have salvation; 'Sola virtus invicta'—Virtue alone is invincible; 'Non mihi, sed Christo'—Not to myself, but to Christ; 'Sub cruce'—Under the cross. Many are loyal and patriotic; as 'Vincit amor patrie'—Love of country conquers; 'Non sibi, sed patrie'—Not for himself, but for his country; 'Patria cara, carior libertas'—My country is dear, but my liberty is dearer. Others are philanthropic; as 'Homo sum'—I am a man; 'Non sibi solum'—Not for himself alone. Treffry of Cornwall used 'WHYLE GOD WILLE,' and Cornwall of the same county, 'WHYLE LYFF LASTE.'"

'But the most curious class of mottoes are the emblematical, some of which allude to the charges in the arms, and others to the surname, involving a pun. Of those allusive to the arms or crest, the following are examples:—That of the Earl of Cholmondeley is 'Cassis tatissima virtus'—Virtue the safest helmet; alluding to the helmets in his arms; and that of the Egertons, 'Leoni, non sagittis fido'—I trust to the lion, not to my arrows; the arms being a lion between three pheons, or arrow-heads. The crest of the Martins of Dorsetshire was an ape, and their motto, *HE WHO LOOKS AT MARTIN'S APE, MARTIN'S APE SHALL LOOK AT HIM.*' In a long miscellaneous list which follows, we find many which consist of puns. D'Oyle of Norfolk bears, 'Do no YLL, quoth D'Oyle!' Fairfax, 'Fare fac' Speak, do—A word and a blow. Dixie of Leicester-shire, 'Quod dixi dixi'—What I've said I have said. Fitton, *Fight on, quoth Fitton.* For Mr Lower's benefit, we take leave to introduce one which we lately saw in connexion with the arms of Menzies of Menzies, over the door of the old church of Weem in Perthshire, and which excels all we know in pith and brevity—'Vn God, I sal.' Let any one try, by any other arrangement of ten letters, to say as much. The date of the stone is 1600.

Some curious anecdotes appear under the head 'Historical Arms; Augmentations.' For example—'Bulstrode of Bulstrode, co. Bucks, bore, as a crest, A bull's head, erased gules, attired argent, between two wings of the same. When William the Conqueror subdued this kingdom, he gave the estate of this family to one of his own followers, and lent him a thousand men for the purpose of taking possession, *vi et armis*. The rightful owner calling in the aid of some neighbouring gentlemen (among others, the ancestors of the Penns and the Hampdens), gallantly resisted the invader, intrenching himself with an earthwork, which is still pointed out as evidence of the truth of the story. It seems that the besieged party, wanting horses, mounted themselves upon *bulls*, and sallying out of their camp, so affrighted the Normans, that many of the latter were slain, and the rest put to flight. The king, hearing of this strange affair, and not wishing to push matters to an imprudent extent, sent for the valiant Saxon, with a promise of safe conduct to and from his court. The Saxon paid the Conqueror a visit, riding upon a *bull*, accompanied by his seven sons similarly mounted. The result of the interview was, that he was allowed to retain his estate. In commemoration of these events, he assumed the crest above described, together with the name of *Bulstrode*! The whole narration exhibits strong characteristics of that peculiar genus of history known as "Cock and Bull stories;" although it is probably quite as true as a distich preserved in the family, that

WHEN WILLIAM CONQUERED ENGLISH GROUND,
BULSTRODE HAD PER ANNUM THREE HUNDRED POUND.

Another—'Sir Richard Waller was at the battle of Agincourt, where he took prisoner Charles, Duke of Orleans, father of Charles XII. (afterwards king of France.) This personage was brought to England by his captor, who held him in "honourable restraint" at his own mansion, at Groombridge, co. Kent, during the long period of twenty-four years, at the termination of which he paid 400,000 crowns for his ransom. In accordance with the chivalrous spirit of that age, the captor and captive lived together on terms of the strictest friendship. This appears from the fact, that the duke, at his own expense, rebuilt for Sir Richard the family house at Groombridge. He was also a benefactor "to his parish church of Spelhurst, where his arms remain in stonework over the porch." Previously to this event, the family arms had been the punning device of "Sable, on a bend voided argent, three *walnut* leaves or;" and the crest, "A *walnut* tree fruited proper." To one of the lower boughs of this tree was now appended a shield, charged with the arms of France—"Azure, three fleurs-de-lis or, differenced with a label of three points;" an augmentation which continues to be borne by the descendants of Sir Richard Waller to this day.

Some arms bore reference to the situation of the family mansion. Thus Wallop, Earl of Portsmouth, has 'argent, a bend wavy sable,' alluding to a *wall* springing from a hillside or *hope* near the family house in Hampshire; the name being derived from this local circumstance. 'Hume of Nine Wells, the family of the great historian, bore, "Vert, a lion rampant argent within a bordure or, charged with *nine wells* or springs barry-wavy azure and argent." "The estate of Nine Wells is so named from a cluster of springs of that number. Their situation is picturesque; they burst forth from a gentle declivity in front of the mansion, which has on each side a semicircular rising bank, covered with fine timber, and fall, after a short course, into the bed of the river Whitewater, which forms a boundary in the front. These springs, as descriptive of their property, were assigned to the Humes of this place as a difference in arms from the chief of their house."

'Here,' says Mr Lower, 'we may be allowed to digress, to say a few words on the origin of *inn* signs, which are generally of a heraldic character. In early times, the town residences of the nobility and great ecclesiastics

were called inns, and in front of them the family arms were displayed. In many cases these inns were afterwards appropriated to the purposes of the modern hotel, affording temporary accommodation to all comers. The armorial decorations were retained, and under the names of signs, directed the public to these places of rest and refreshment. On calling to mind the signs by which the inns of any particular town are designated, a very great majority of them will be recognised as regular heraldic charges. In addition to the full armorials of great families, as the Gordon Arms, the Pelham Arms, the Dorset Arms, we find such signs as the Golden Lion, Red Lion, White Lion, Black Lion, White Hart, Blue Boar, Golden Cross, Dragon, Swan, Spread Eagle, Dolphin, Rose and Crown, Catherine-Wheel, Cross-Keys, *cum multis aliis*, abundant everywhere. These were originally, in most cases, the properly emblazoned armories of families possessing influence in the locality; and frequently the inns themselves were established by old domestics of such families. But owing to the negligence of mine host, or the unskilfulness of the common painter who from time to time renovated his sign, the latter often lost much of its heraldic character; the shield and its tinctures were dropped, and the charges only remained; while, by a still further departure from the original intention, three black lions, or five spread eagles, were reduced to one. A house in the town of Lewes was formerly known as the "Three Pelicans," the fact of those charges constituting the arms of Pelham having been lost sight of. Another is still called "The Cats," and few are aware that the arms of the Dorset family are intended. In villages, innumerable instances occur of signs taken from the arms or crests of existing families, and very commonly the sign is changed as some neighbouring domain passes into other hands. There is a kind of patron and client feeling about this—feudality some may be disposed to call it—which a lover of old England is pleased to contemplate.'

The work is elegantly printed, and contains many illustrative wood-engravings.

BIRTHS, MARRIAGES, AND DEATHS IN ENGLAND.

ONE of the most ponderous presents which her majesty has commanded to be made to both houses of parliament for some time, is an immense blue-book, some five inches thick, containing the annual report of the Registrar-General for births, deaths, and marriages.* It is compiled from the registers of the year 1842, and presents a mass of statistical information not only important in a legislative point of view, but highly interesting to the general reader.

From the complication of facts collected concerning BIRTHS, we learn that during the year 1842 there were born in England 517,739 children. Comparing this number with the amount of births which respectively took place in the three previous years, we find further corroboration of the uniformity with which nature operates in dealing with large masses of facts of every description:—In 1839 there were 492,574 children born; in the following year, 502,303; in 1842, the increase of population by births was 517,739. Thus the increase was gradual and uniform. The Registrar-General proves that, during the four years 1839-42, about 6½ per cent. of the whole female population were mothers; that is to say, out of every hundred women who lived in England during that period, one in every sixteen produced a baby. The proportion for the respective years were, in 1839, of every hundred women, 6·211 was a mother; in 1840 the per centage was 6·250; in 1841 it was 6·289; and in 1842, 6·273. The most

* The Sixth Annual Report of the Registrar-General of Births, Deaths, and Marriages registered in England during the year 1842. Presented to both Houses of Parliament by command of her Majesty.

prolific parts of England were Lancashire and Cheshire, where the number of births in proportion to the population was 8.599 per cent. The least prolific were the south-eastern districts, in which the per centage was 2.887.

Concerning the next great event in human existence—MATRIMONY—the Registrar-General has accumulated a mass of statistics quite commensurate with the importance of the subject. In 1842 there were wedded in England 118,825 couples. Of these, 26,198 had been previously married; namely, 15,619 widowers, and 10,579 widows. By striking an average of the gross number of marriages which occurred in the four years 1839-42, the result appears that there was one marriage in each year to every 130 individuals living. In 1842 there were fewer persons married by from three to four thousand than during any of the three previous years, which the Registrar accounts for by the commercial depression of that year. But this surmise (which he calls a 'fair inference') is quite at variance with the opinions and facts produced by M. Quetelet and Mr Rickman, who found that when distress most prevailed, marriages were most largely resorted to as a ready but improvident solace for misery. Besides, the Registrar's inference is far from a 'fair' one: for what is the fact? The 'great depression of trade, and stagnation of commerce,' which he adverts to, were far more severe in the three years previous than in 1842, when the dawn of prosperity began. Now, in 1839 there were 4841 more marriages, and in 1841, 3671 more than in 1842; so that the fairest inference is, that Quetelet's and Rickman's deductions in reference to the effect of national distress on matrimony are correct, and that not commercial stagnation, but that prudence which invariably accompanies a gleam of prosperity, was the cause of the decrease of marriages during 1842. That greater prudence prevailed, from whatever cause, is proved by another fact. By a reference to the ages of the persons wedded in 1842, we perceive there was a decrease of youthful, and therefore of rash and imprudent marriages. The minors married in 1841 were 21,647; in 1842, 21,390, or about 1 per cent. less than the former number; whilst the diminution in the number of persons of full age married was 7085 in 223,345, or 3 per cent.—facts which seem to be favourable to the future wellbeing of the population, who must inevitably suffer more or less by an increased number of (too often improvident) marriages. In the south and east of England, the proportion of marriages to the population was either stationary or only slightly increased; while in other parts of the country, and in the metropolis, they decreased. This supplies us with another corroboration of an important and singular natural law, which statisticians have discovered; namely, that the greater the number of marriages in a community (up to a certain point), the fewer the births. The south-eastern districts of England (see above) were the least prolific by about 1 per cent., while in nearly the same counties the proportion of marriages to the population was if anything increased.

We now come to the statistics of MORTALITY. In 1842 the number of deaths amounted to 349,519, or nearly 1 in every 46 of the then population: the average annual rate of mortality for the five years 1838-42 was 1 in 45 persons. The mortality in Cheshire, Lancashire, Yorkshire, the metropolis, and the northern and midland divisions, remained below the average; whereas in the southern divisions of the island the mortality was higher than in 1841, and higher than the average of those divisions for 1838-42, which, nevertheless, had in the five years fewer deaths in comparison to their population than any other tracts of country of equal extent from which returns had been obtained. In 1842, the mortality under five years of age was somewhat lower—of persons at more advanced ages a little higher—than in the preceding year. The rate of mortality in England appears to be lower than in France, Prussia, Austria, and Russia.

From a comparison of the births with the deaths which occurred in the years 1839-42, we discover that, as the gross amount of the former was 2,024,774, and of the latter 1,391,979, the excess of births was in that period 632,795; so that the mean annual increase of population was about 158,199. Supposing this rate of augmentation to be quite uniform, and remembering that the last census gave the population of England, on the 1st July 1841, at 15,927,867, its probable increase by the 1st of July of the present year from births alone will raise it to nearly 16,600,000.

Some interesting but at the same time painful facts are disclosed relative to unexpected and violent deaths. Many remarkable cases were given, showing what slight causes are sufficient to terminate life, either through ignorance, inadvertence, or the want of proper precaution. Amongst others, we find a case of tetanus produced by a stick thrust up the nose, choking by a string, suffocation by substances intruding themselves into the windpipe, choking from a bullace, convulsions from eating hard peas, explosion of fireworks in the pocket, a knitting-needle piercing the hand, eating yew-berries, taking poisons by accident, an over-dose of tartar emetic, cantharides, oil of bitter almonds, incautious use of mercury, drinking aquafortis, eating berries of the dulcamara, inhaling the fumes of whitelead, drinking spirits and spirits of wine, the bite of a pig, &c.

The tables contained in this enormous folio will doubtless supply bases for important legislative enactments. A revision of the mortality tables, upon which assurance-offices charge their usually too high premiums, will, we trust, be an early effect of this voluminous report.

A WORKING MAN'S MEMOIRS.

THE thirty-fourth issue of Mr Knight's 'Weekly Volume for all Readers' consists of the autobiography of a journeyman tailor, which, without offering much to interest general readers in point of incident, furnishes an instructive lesson of patient perseverance and honest industry. The hero mentions neither his own name nor that of his native town—an unnecessary delicacy, for which no reason is given, but which deprives the reader of a main source of interest. The memoirs—which are written in plain, homely, but good English—are not the first attempts of their author in literature, for, amongst other productions, he previously wrote *The Manual for the Apprentices to Tailors*, which formed one of the *Guides to Trade* published by Knight and Co.

It appears that from the beginning this working-man was doomed to misfortune, and that his existence was only prolonged from the hour of his birth by an accident. 'I was born,' he narrates, 'on July 5, 1792, but in so feeble a state, as to be thought dead. After having been put aside for some little time, a neighbour in attendance upon my mother observed that I showed symptoms of being alive, on which she took me in hand, and thus saved me from a premature death. But although it was given me to live, I proved to be of a feeble constitution, which in subsequent years brought upon me many infirmities and inconveniences. I am indeed unable to apprehend fully the pleasurable sensations attendant upon robust and unbroken health, having never enjoyed that invaluable blessing; but I suppose them to be very delightful, and cannot but wish that all who possess what is called "good health" were duly sensible of its value.' Still, he grew up in an ailing state, and when about five or six years old, was taught to read by his mother, who kept a dame's school, and at ten became a candidate for admission into a Protestant dissenter's charity school. It was required that applicants for admission should present themselves to the managing committee, to prove their capabilities by reading in the New Testament. The autobiographer proceeds to draw a graphic picture of the class of people who, half a century ago, were the patrons of educational establishments. It will amuse the modern reader. 'I well

remember the subdued feelings with which I wended my way to the place of trial. It was on a winter's evening, when the dreary aspect of everything around me was in keeping with the solemnity of the business in which I was engaged. It was well for me that my good mother took me under her wing, as otherwise I should certainly have been confounded when I came before my examiners. These worthy, but to me awful, personages were assembled in a large upper room of an ancient inn. They were seated around a fire that was blazing cheerfully, and almost eclipsing the light of the candles, which of themselves would have but just sufficed to make "darkness visible." I was too much abashed to allow of my surveying the room very closely; what I saw of it, therefore, was only by occasional and hasty glances. I observed, however, that the table was well furnished with bottles and glasses, pipes and tobacco, indicating that the company present thought it wise to relieve the cares of business by a little of that which tends to make the heart glad. I cannot now remember all who were present, but have a clear recollection of several, among whom was the minister of the congregation, an aged, venerable-looking man, whose close-fitting, neatly-curled wig, and somewhat antiquated dress, accorded well with his age and character. There was also a worthy gentleman, one of the deacons, whose portly figure, powdered head, and commanding aspect, filled me with profound awe. He was, however, a kind-hearted and affable man. I could have spoken without much perturbation to either of these good men, had I met him alone and casually; but to see them all at once in a strange place, and invested with authority to question me, was too much for one so timid as I then was. A novice monk in the august presence of his holiness, and a full conclave of cardinals, or a presumed heretic at the tribunal of the Inquisition, could hardly feel more discomposed than I did when directed to read aloud in the hearing of my assembled judges. I obeyed this dread mandate with much trepidation, but was enabled to do it so as to escape censure. My mother gave such further information about me as was required: upon which I was unanimously elected, with some expressions of approbation.

'Thus ended my much dreaded trial, to my no small relief and satisfaction: I had passed through the ordeal unscathed, although much frightened, and I could not but rejoice at my success. I was well satisfied with the treatment I had met with from my examiners; but, as a faithful chronicler, I am bound to state that I was not a little puzzled at a part of their proceedings. They were smoking; and as I had been accustomed to regard this practice as indicative of intemperate or loose habits, I was greatly surprised at seeing "grave and reverend" men like these wielding the ominous tobacco-pipe. Even the minister was thus employed: this was the most inexplicable circumstance of all. I afterwards learned that he was an inveterate smoker, which intelligence further increased my perplexity. I feared that all was not right, but I was too poor a casuist to grapple with so knotty a question; I was therefore compelled to leave it until I should be more equal to the task.'

While at school, the future working-man describes his habits as having been studious. He was very fond of reading, and made great sacrifices to obtain books, and to get leisure to read them. When only thirteen years old, he obtained a situation as an errand boy to a tailor and woollen-draper. His duties were neither light nor pleasant, for he was constantly at the beck of no fewer than twenty-one persons; namely, 'his master and mistress, five children, two maid-servants, a shopman, two apprentices, a foreman, and eight journeymen.' In this very large family, however, he found a friend in his master's son, who, amongst other favours, gave him access to a library which consisted of 'Enfield's Speaker, Goldsmith's Geography, an abridged History of Rome, a History of England, Thomson's Seasons, the Citizen of the World, the Vicar of Wakefield, and a few others. To be able to read these books, says our hero,

'I arose earlier from bed, read while walking or eating, and took care not to waste the spare minutes which sometimes fell to my lot in the course of my working-hours. By these means I saved more time in the aggregate than I had previously thought to be possible. It was indeed made up of fragments, yet I contrived to make it answer my purposes.' With praise-worthy perseverance, he also learnt to become an expert tailor in the few spare hours which fell to his share; and the manner in which this sickly but persevering youth economised his time, fully realises the adage, that 'where there is a will there is a way.' 'Instead of cleaning the tailor's shop, preparing fuel, and getting the furnace ready in the morning, I did these and other needful things at night, after the men had left off work; by this plan I secured an hour, in the best part of the day, for learning to sew. In addition to this contrivance, I also rose yet earlier than before, in order to help one of the workmen who lived close at hand. I worked with him until it was time to go to the shop, and by this means got both instruction and a little money—sometimes as much as eightpence or tenpence at the week's end—which was no unimportant addition to the contents of my private purse. Besides these plans, I adopted that of working at home whenever an opportunity offered for so doing. Nor did I always allow myself to make a holiday of even the few red-letter days that fell to my lot; for I well remember having worked on a Good Friday, a beautifully fine day, which seemed almost audibly to invite me into the green and delightful fields. On that day I also contrived to amuse myself by committing to memory a large portion of Gray's beautiful Ode on Vicissitude. I further remember to have worked on other holidays—especially on that which, in 1809, was kept in commemoration of the king having entered upon the fiftieth year of his reign. By dint of persevering industry and attention, aided by the good offices of several of the workmen, I soon got such an insight into the business as enabled me to be very useful upon the board. Ere long my master saw that my services there were more profitable to him than they could be elsewhere; and therefore he consented to hire another, but a younger boy, to do the greater part of the work which previously had chiefly employed my time.' This welcome promotion materially diminished the labours, and increased the comforts and emoluments of the persevering youth, who, when he had arrived at man's estate, had acquired not only a proficiency in his trade, but a valuable stock of literary information; for he still went on reading whenever a moment of leisure presented itself.

The working-man, finding himself a competent tailor, determined to try his fortune in London, and travelled thither in 1810. The information conveyed in the following passage is curious:—'On the day after my arrival in London, I went out in quest of employment. This I did in the way which at that time was the most in favour with my fellow-craftsmen, as being thought both more respectable and more profitable than that of waiting upon masters to ask for work. This was by causing my name to be entered in the call-book of a tailors' trade-club, which was held, as all such clubs then were, at a public-house, thence denominated a "house of call." To these houses the masters applied when they wanted workmen. They could here procure, if needful, a fresh supply of men three times per day; namely, at six o'clock in the morning, then at nine o'clock, and again at one o'clock in the afternoon. The master had the power of discharging a workman at his pleasure, after having given him three hours' work or wages. Thus the men could have as many as three masters in the course of one day.

'I was called to work during the very day on which I had my name entered on the call-book; but it was merely for the remainder of that day, as my master was himself a journeyman, who wanted a little help about an occasional job of master-work. Here I was in due form invested with all the shop-board rights and privi-

leges of the craft, by paying what was technically called my "footing;" that is, in plain English, by treating my workfellows to a fair allowance of porter—a practice which I subsequently set my face against, and with much success. At night I was discharged, and again repaired to the "house of call," where I received orders to go to work at six o'clock in the following morning for a master residing in Hatton Garden. I now felt myself at ease. I had fairly launched my tiny bark upon the broad expanse of life's ocean, and I was resolved, if possible, to make a profitable voyage. With this view I applied myself to work with all practicable diligence. It required my utmost efforts to get through the allotted amount of a day's work within the appointed time—for the time, as well as the amount of work, was strictly regulated. This daily task was considerably too much for any one but a clever and very quick hand; but then, as it was fixed by the workmen themselves, there was neither room for complaining of the masters, nor any good end to be answered by grumbling to the men. I therefore took the matter quietly, and did my best. This task was, in shop-board phrase, called "the log;" and a very appropriate name it truly was, for the task was indeed a heavy one. Yet, as it showed the equitable principles upon which our trade-unions were founded—in providing that the largest possible amount of labour should be given in exchange for the good wages demanded—it was generally approved of even by such as, like myself, were not fully equal to the labour it imposed. When I received my first week's wages, amounting to thirty-three shillings, I was not a little pleased. I felt that I had fairly performed the part of a man, and my self-love prompted me to look upon so meritorious a personage as myself with more respectful feelings than heretofore. My week's wages was a larger sum than I ever before could at one time call my own; I was therefore comparatively a rich man. Yet, after all, I would gladly have taken three shillings per week less in wages, if thereby I could have escaped from the pressure of that incessant, and, to me, exhausting toil which I was compelled to undergo, in order to keep up to "the log." My strength, like that of many others, was not equal to this toil, especially in so hot and otherwise unhealthy a place as is a tailor's workshop, in which I was confined for full twelve hours per day, the hours of working being from six o'clock in the morning until seven o'clock in the evening, one hour only being subtracted for dinner. As to time for breakfast, or any other refreshment, there was not allowed even a moment.

In this way he went on, sometimes overwhelmed with employment, at others with nothing to do, but on the whole maintaining himself creditably, till he resolved to take unto himself a wife—in the person of a young woman he had long known. His wedding-day is thus described:—"About the end of May 1819, we were married at St Paul's, Covent Garden, which was my parish church. We spent a part of our wedding-day in looking at the royal artists' exhibition of paintings at Somerset House, in which we found much that gave us very pleasant entertainment. Afterwards, as the day was beautifully clear and serene, we indulged ourselves with a short excursion, in a westerly direction, upon the broad and gently-flowing Thames." In a few days he returned to his native town, where he commenced business on his own account.

Years passed on, the working-man being gradually surrounded with a large family, whom he brought up in a praiseworthy manner, living respectably and respected amidst the companions of his youth; but constitutional ill health, increased by his energetic exertions to support his family with credit, demanded change. His physician assured him, he remarks, "that nothing more could be done for me in the way of medicine while I continued to breathe the somewhat keen air of my native town. I therefore resolved to try whether that of London would be more favourable. I had, as I have already observed, been effectually relieved

by it when a younger man, and I hoped it might prove useful to me again, although I did not expect it would be so to the same extent as formerly." Accordingly, the working-man again changed the scene of his labours, and indeed the nature of them; for having published a volume of lectures previously delivered by himself in his native town, and obtained, through that, other literary engagements, he divided his time between the pen and the needle. This is, it appears, his present mode of livelihood, and he concludes his memoirs in these words:—"Except when wholly overborne by bodily pain or infirmity, I am rarely unemployed, either in the day-time or in the sleepless hours of the night, of which I have not a few. I aim to be useful, and am occasionally encouraged to believe that I am not wholly unsuccessful. Not unfrequently a cheering ray breaks through the clouds that rest upon the future, and shows me some glimpses of a brighter world and a happier state of being. Thus I pursue my course with tolerable equanimity of feeling. There is much attainable good wherewith to compensate the inevitable evils of my lot. I aim to secure the first, and would fain extract some good from the second. Unceasing occupation of the mind upon some given subject, and with a view to the happiness of others, is one of the best means of drawing off the attention from personal sufferings, and of preventing the affections from becoming either chilled or selfish. The work of writing these memoirs has many a time raised me above the depressing influence of great bodily disorder. I should grieve that my task is done, but that I have already resolved to begin another."

The want of uncommon incidents is well supplied in this little story of a good and well-spent life, by the indomitable self-reliance which the author exemplifies in every page. It is considered creditable for a man of robust constitution to fight through the world unscathed, and to bring up a family respectably amidst the strife; but for one who from his cradle was borne down with sickness—occasionally prostrating him for weeks, undoing all which care and industry had previously done—to arrive towards the close of existence so well as our author has done, is assuredly a sort of heroism. We take leave of the working-man, wishing him all success in his future career.

APOLOGY FOR THE NERVES.

SIR GEORGE LEFEBVRE, M.D., has published a clever volume under this somewhat eccentric title, which by no means expresses the miscellaneous character of the work, though justified in some degree by the author's theory as to the concern of the nervous system in the production of various diseases. We have been particularly struck by Sir George's speculations on the Cholera Morbus, which came strongly under his attention at St Petersburg. Here, especially, he insists on the important part played by the nervous system; but the main impression left on the mind is, that the Asiatic scourge of 1832-3 arose primarily from meteorological causes.

'I had,' says he, 'during my residence in St Petersburg, some opportunities of seeing this disease in its most murderous form; for the deaths in the city averaged more than a thousand daily at its onset. I published the results of some of my experience, and now, after a lapse of fourteen years, I must subscribe to the truth of Dr Holland's assertion, as expressed, page 568, in his Notes and Observations:—"That strange pestilence of our time, which, while affrighting every part of the world by its ravages, has seemed to put at nought all speculations as to its causes, or the laws which govern its course—a disease, nevertheless, which, by the mystery of its first appearance, its suddenness, inequality, and fatality, and the failure hitherto of every method of treatment, may well excite the inquiry of all who are zealous for the extension of medical science." The idea of its originating in insect life was adopted by several German professors very soon after its first appearance. The eccentric movements of the malady, its zig-zag direction, quitting the broad line of route, flying off at a

tangent to appear in a widely distant point, would all argue certain atmospheric currents wafting their poisonous contents in regions beyond our powers of arrest.* Dr Prout's observations, proving that there was a constant increase in the weight of the atmosphere, deserve much attention in our future investigations, for this may not have been a casual coincidence; its constancy during the whole prevalence of the disease militates against this opinion. Freely confessing that what we professed to know about this plague, when in the heat of the battle, was but mere presumption, we still pertinaciously adhere to the belief of its non-contagious character; and we repeat, in the words of our former little treatise, "As far as my practice is concerned, both in the quarter allotted me, and also in private houses in different parts of the town, I have no proof whatever that the disease is contagious. In one case I attended a carpenter in a large room, where there were at least thirty other workmen, who all slept upon the floor among the shavings; and though this was a very severe and fatal case, no other instance occurred among his companions. In private practice, and amongst those in easy circumstances, I have known the wife attend the husband, the husband the wife, parents their children, children their parents, and in fatal cases too, where, from long attendance and anxiety of mind, we might conceive the influence of pre-disposition to operate, yet in no instance have I found the disease communicated to the attendants; . . . so that, as far as proof can be drawn from my own limited experience, I have none to offer in favour of contagion." In the history of its prevalence in St Petersburg, it is certain that the anti-contagionists did increase with the increase of the disease; and its spread over Europe has considerably increased their ranks, and the number of those has much diminished who contributed at one time to excite so much alarm among the people.

"This is, perhaps, all the knowledge we have gained upon the subject, and the evidence has been sufficient to convince most that the disease has nothing in its form or features, nor in its mode of propagation, which can entitle it to rank amongst those of a positively contagious character. Even negative evidence may become positive in certain circumstances, and of this the town of Odessa has furnished convincing proofs at two separate periods since the retreat of the cholera from Europe. It was found that the strictest military cordons did not, in any country whatever, arrest its progress. It stole its way through them, dodged the sentries—defied the point of the sword and bayonet.

"It is said to have reached Sunderland by a ship which left Hamburg before it was recognised to exist in that city, where its appearance some days afterwards was sufficient, with some logicians, to prove that it was imported from thence. It must be recollected that none of the crew were attacked by it on the voyage; and here we may quote Dr Holland:—"Nor will previous communication, though certainly concerned in part in the transmission of the disorder, resolve these singularities." It was not human contagion that operated in this instance. Still, this distinguished physician observes, "Man becomes an agent in the diffusion," p. 577; and again, in his hypothesis of insect life as a cause of this disease, he observes, "But also possessing the power of reproducing itself, so as to spread the disorder by fresh creation of the virus which originally produced it."—P. 574.

"To return to the Hamburg brig, which discharged her cholera cargo at Sunderland, and might then, as far as her crew was concerned, have got a clean bill of health, it is still an anomaly that she should transport a disease from a town where it did not exist when she left the port, when so many more ships could not effect this which left infected ports. This was the case with Elsinore, where upwards of five hundred vessels touched, all chartered in the port of Cronstadt, where the cholera raged furiously. We do not know that up to the present day this town was visited by a single case, although its *vis a vis* across the Sound, the Swedish town, where no vessels touched, suffered severely. This is one of the inexplicable frolics of this disease.

"Now, with respect to the negative evidence, which becomes positive. The plague has twice been imported into Odessa from Turkey within the last few years, and several have died of it; but by means of rigid quarantines and cordons, and the energy which Count Woronzoff displayed in arresting its progress, such as hanging a Jew who was

about to violate the laws established, not a single death occurred without the city; the plague never got out of the gates.

"Why should not the same observances and precautions, for they were the same, have succeeded in both cases? The cholera has never been arrested by human means in its progress—the plague often.

"When the former has located itself in a country, it will be easy enough for those so disposed to find evidence of its human communication and propagation from one town to another. A man may take it by railroad from Liverpool to Manchester, at least be supposed to do so; but have we evidence of its first invasion in this way wherever it has appeared? Has any landman, any sailor, made his appearance in any place with the disease upon him, and first communicated it to the inhabitants of town or village? It was not so propagated in Sunderland. It was not so in St Petersburg. Hundreds came into the latter city from Moscow, where it raged eight months previously: not a soul was affected on the whole line of route. When it did appear, the same anomaly was presented as in the Hamburg ship. It was said to be brought down by the tallow barks from the frontiers of Siberia, though not a single bargeman had been affected during the long transit. The man who was said to be first affected was not so till after his arrival in St Petersburg. In three days every quarter of that wide spreading city was grievously punished by the disease. The man died in the suburbs of the town amongst the lowest class of the inhabitants, none of whom could, directly or indirectly, have communicated with the higher orders. Many locked themselves up in their rooms as soon as the disease was announced, and died isolated from human communication. There was no more proof that the bargeman brought it than that he found it at St Petersburg. It is the argument *ad absurdum* to say that it should take a tortuous route of three thousand miles to arrive there, when it was raging for seven months at Moscow, a distance of five hundred only, and with which there were all the time daily communications.

"A fact well worthy of note is the circumstance, that of the eleven medical men who fell a sacrifice to it in St Petersburg, they were almost all practitioners who had the least to do with it—men practising in private, and not those who were attached to the great hospitals, of whom I do not recollect that more than one perished; and precisely the same observation was made by one of our colleagues who practised in Dantzic.

"As regards the nature of the disease, Dr Wilson has observed—"Epidemic cholera is the result of an atmospheric poison, or other vice in the blood." I had two opportunities of seeing its attack—of recognising the first symptoms of its presence.

"I observed a labourer who was walking in the street stagger, reel, put his hand to his head, and fall down. I thought he was in liquor, and overcome by the heat of a burning sun. Upon approaching him, I found him attacked by cholera. He was removed to the nearest hospital. I do not know his fate. A director of one of the cholera hospitals was presiding at a committee where I was present. In discussing some matter with one of the physicians, he suddenly put his hand to his forehead, and complained of a shooting pain through his head, which he attributed to having taken a pinch of strong snuff. It increased, however, in the evening. It was the commencement of the disease, which carried him off on the fifth day. In these two cases it would appear that the brain was first attacked. In some few instances it hardly deserved the name of spasmodic, to judge from the outward manifestation of spasm. I have known it kill in six hours, without much pain in the muscular fibre, but here the injury done to the nerves was more manifest. The derangement of all those functions under their control—as the loss of animal heat, suspension of secretions, conversion of insensible perspiration into clammy sweat, the almost involuntary pouring out of the contents of the stomach, all proved how much the great vital power was paralysed. Of the offence to the blood there can be no doubt, and of the reaction of this diseased fluid again upon the nerves; but it is questionable if the poison first creep in through the blood. Supposing the poison to be in the blood, the spasm and cramp are in the muscles, and this in a ratio with the virulence of the poison.

"As regards the use of opium, it was found, as Dr Wilson has stated, to be followed by very deleterious effects. Low nervous fever was the result of its employment in repeated

* This would equally apply to malaria, which is transportable in this way, as proved by Dr Macculloch.

doses; and if the disease were thoroughly formed, it was never arrested by the use of this drug: but I must add, that for those uneasy symptoms which threatened a commencement, a dose of laudanum, combined with an antispasmodic, stood me in much service in my practice. In many, probably in most cases, there was no other disease to combat than the effects of fear, where this antidote proved useful. The patient, attentive to every little pain and ache, was rendered more susceptible of the malady, and the immediate relief afforded him by this diffusible stimulus dispelled his fears of future consequences. John Brown, one of the brightest but most eccentric meteors that ever illumined the medical horizon, has observed, that no man, however disposed he might be to commit suicide previously, would ever think of doing so after a dose of laudanum, at least while under its intoxicating influence. He ranked it amongst the most powerful stimulants. I therefore put all who were in the habit of consulting me in possession of a "sovereign remedy," in case of need, and I had no reason to repent of so doing.

Amongst other subjects treated by Sir George are the Blood, Sympathy, Dreams, Headaches, Fevers, Homœopathy, and Mesmerism. An observation which he makes in the last mentioned chapter—that, if some of the alleged facts be true, they are miracles—seems to us eminently unphilosophical: they would only show, we apprehend, that our ordinary views of the compass of nature are too limited. The following anecdotes are new to us, and very striking:—'As long as nervous excitement can be kept up, the resistance of cold is very great. General Piroffsky informed me, that in the expedition to Khiva, notwithstanding the intenseness of the cold, the soldiers marched along singing, with the breasts of their coats open, but only as long as they were flushed with the hopes of success. Where there is nothing to excite, and where exposure to cold takes place under the common routine of parade, its depressing effects are lamentably felt by those long exposed to it. In the time of the Grand Duke Constantine, a regiment of horse was marched from Strelina to St Petersburg, a distance of twelve miles and upwards. He marched at their head at a foot-pace all the way. He had well wadded himself, and smeared his face over with oil. It was the gratification of a whim to expose the soldiers to a great degree of cold. They arrived at the square before the palace, and were dismissed to their barracks. The following day one-third of the regiment was in the hospital, attacked by nervous fever, of which many died. There was no stimulus of necessity in this case, but the moral feeling aggravated the physical suffering.'

COMPANY.

There is a certain magic or charm in company, for it will assimilate and make you like to them by much conversation with them. If they be good company, it is a great means to make you good, or confirm you in goodness; but if they be bad, it is twenty to one but they will corrupt and infect you. Therefore be wary and shy in choosing and entertaining, or frequenting any company or companions; be not too hasty in committing yourself to them; stand off awhile till you have acquired of some (that you know by experience to be faithful) what they are; observe what company they keep; be not too easy to gain acquaintance, but stand off and keep a distance yet awhile, till you have observed and learned touching them. Men or women that are greedy of acquaintance, or hasty in it, are oftentimes snared in ill company before they are aware, and entangled so that they cannot easily get loose from it after when they would.—*Sir Matthew Hale.*

CURIOUS EFFECTS OF EARTHQUAKES.

The St George's Chronicle—*island of Grenada, West Indies*—mentions the following remarkable fact: namely, that on the occurrence of the earthquake there on the 19th of January 1844, those clocks of which the pendulums oscillated from east to west were almost all stopped, while those whose pendulums vibrated north and south were not affected. It is also mentioned that the needles of the compasses on board the Thames steamer, which was then among these islands, revolved on their centres with great rapidity during the convulsion.

THE PAINTER'S LOVE.

THE summer day had reached its calm decline
When the young painter's chosen task was done,
At a low lattice, wreathed with rose and vine,
And open to the bright descending sun,
And ancient Alps, whose everlasting snows
And forests round that lonely valley rose.
Yet lovely was the brow and bright the hair
His pencil pictured; for an Alpine maid,
In blooming beauty, sat before him there;
And well had the young artist's hand portrayed
The daughter of the south, whose youthful prime
Was bright as noontide in her native clime.
Perchance the maiden dreamt not that amid
The changeful fortune of his after days
That early-treasured image should abide,
The only landmark left for memory's gaze.
Perchance the wanderer deemed his path too dim
And cold for such bright eyes to shine on him;
For silently he went his lonely way,
And, like the currents of far-parted streams,
Their years flowed on; but many a night and day
The same green valley rose upon their dreams—
To him with her young smile and presence bright,
To her with the old home, fire, love, and light;
For she, too, wandered from its pleasant bowers,
To share a prouder home and nobler name
In a far land. And on his after hours
The golden glow of art's bright honours came;
And time rolled on, but found him still alone,
And true to the first love his heart had known.
At length, within a proud and pictured hall,
He stood amid a noble throng, and gazed
Upon one lovely form, which seemed of all
Most loved of sages, and by poets praised
In many a song; but to the painter's view
It had a spell of power they never knew;
For many an eye of light and form of grace
Had claimed his magic pencil since its skill
To canvase gave the beauty of that face.
But in his memory it was brightest still;
And he had given life's wealth to meet again
The sunny smile that shone upon him then.
There came a noble matron to his side,
With mourning robes and darkly flowing veil,
Yet much of the world's splendour and its pride,
Around long silvered hair and visage pale;
But at one glance, though changed and dim that eye,
Lit up the deserts of his memory.
It brought before his sight the vale of vines,
The rose-wreathed lattice, and the sunset sky,
Far gleaming through the old majestic pines
That clothed the Alpine steep so gloriously.
And oh! was this the face his art portrayed,
Long, long ago beneath their peaceful shade!
The star his soul had worshipped through the past,
With all the fervour of unuttered truth—
His early loved and longed for, who at last
Gazed on that glorious shadow of her youth!
And youth had perished from her; but there stayed
With it a changeless bloom that could not fade.
The winters had not breathed upon its prime,
For life's first roses hung around it now,
Unblanched by all the waves and storms of time,
That swept such beauty from the living brow;
And withering age, and deeply cankering care,
Had left no traces of their footsteps there.
The loved one and the lover both were changed,
Far changed in fortune, and perchance in soul;
And they whose footsteps fate so far estranged,
At length were guided to the same bright goal
Of early hopes; but oh to be once more
As they had been in that sweet vale of yore!
They cast upon each other one long look;
And hers was sad; it might be with regret
For all the true love lost; but his partook
Of wo, whose wordless depth was darker yet;
For life had lost its beacon, and that brow
Could be no more his star of promise now.
And once again the artist silently
Passed from her presence; but from that sad hour,
As though he feared its fading heart and eye,
Forsook all mortal beauty for the power
Of deathless art. By far and faded streams
He sought the sculptured forms of classic dreams,
And pictured glories of Italian lore,
But looked on living beauty never more.

FRANCES BROWN.

Stranorlar, Jan. 1845.

Printed by William Brodhead, of No. 6, York Place, and Frederick Mullist Krause, of No. 7, Church Row, both of St. John's, in the county of Middlesex, printers, at their office, Lombard Street, in the precinct of St. Andrew's, in the city of London; and Published (with permission of the Proprietors, W. and J. CHAMBERS,) by WILLIAM SOMERVILLE ORR, Publisher, of St. Ann's Church, at No. 2, AMENT CORNER, both in the parish of Christ-church, and in the city of London.—Saturday, April 6, 1845.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 67. NEW SERIES.

SATURDAY, APRIL 12, 1845.

PRICE 1½d.

ARCHÆOLOGY OF THE WORD COCKNEY.

THE attributes of a 'Cockney'—a term exclusively applied to a native of London—are fast passing away. His chief characteristics arose from his being always confined within the walls of 'The City;' for, seldom ranging beyond them, he had the credit of being ignorant of rural affairs, and indeed of everything which did not exist within the bounds of London. Now, however, every day lessens the number of Londoners to whom such circumscribed notions can be fairly attributed. The spread of knowledge has dispelled his prejudices, and the locomotive advantages of steam have enlarged his sphere of actual observation. The Cockney is fast becoming a character of past time, and Cockneyism a matter of history.

As it is always pleasant to preserve fading traditions, we purpose saying a word or two on the origin of the term Cockney, and on the peculiarities of the almost extinct class to whom it is applied.

A Cockney is a denizen of Cockaigne, a nick-name for the overgrown capital which William Cobbett called 'The Great Wen,' and which has also received the titles of the 'Great Metropolis,' the 'Modern Babylon,' and many other less apt but equally humorous designations. Etymologists, in tracing the origin of the term Cockaigne, have pushed their persevering and erudite researches as far back as the annals of classical Greece. It means a land of plenty; and Pherecratus, a comic author of Athens, who was contemporary with Plato, furnished the earliest idea on record of the country which afterwards got the name of the land of Cockaigne. The first description of a place actually so called was given in the thirteenth century, in a French poem entitled 'The Land of Cockaigne.' To save our readers trouble in endeavouring to ascertain the whereabouts of this favoured country, we must premise, that reference to the usual sources of geographical information will assuredly fail; for, like the Happy Valley of Rasselas, and the Territories of Oberon and Titania, it only existed in the pages of a story-book. The poem commences by stating that its author having made a pilgrimage to Rome, to obtain absolution for his sins, the pope inflicted penance by banishment. On arriving at the scene of exile, he was agreeably surprised to find that, instead of its being a place of pains and penalties, it was the head-quarters of luxurious ease—

'For in this country—called Cockaigne—
The more I sleep, the more I gain.'

It was a perfect larder of good living; the walls of the city were made of divers comestibles, the rafters of immense sausages, the roofs of lard, and the laths of barley-sugar. In the streets were tables liberally supplied with eatables, of which everybody was invited to

partake; and there were shops from which goods were to be had without money. A river ran through the city, which consisted on one side of red wine, and on the other of white, whilst three times every week it rained hot custards. Concerts and balls were perpetually given; and no such thing as disagreement or war was known, for people had everything in common. All the females were young and engaging; because in this delightful country existed the fountain of youth, so that whenever a lady began to look old, she had only to drink of the waters, and she felt and looked young again. This glowing description differs but little from the similar one by Pherecratus. Another Greek author, Felecidus supplied a few even more luscious traits to the absurd picture, which the French writer failed to copy. He declared that delicious sweet cakes disputed with equally nice bread which should enter the mouth of the visitor first, and the fish came into the houses ready fried. The Romans added ('Festival of Tremalum'), that tempting little pigs ran about the streets ready roasted. From these materials the author of the Land of Cockaigne formed his picture; and since his time, Cockaigne, adopted probably from the Latin word *coquino*, to cook, has always been used to express a land of plenty.

Festivals in honour of this fanciful territory were held all over Europe till a recent period. The latest account of one we find in Keyser's Travels in Italy, published in 1778. 'Among the public entertainments at Naples,' he says, 'one of the most remarkable is the procession with four triumphal cars on the four Sundays immediately preceding Lent; the first loaded with bread, the second with flesh, the third with vegetables, and the fourth with fish. These provisions are piled up very high, with musicians placed at the top, and guarded by armed men, till they are given up to be pillaged by the populace. But that which draws the greatest concourse at Naples is the *Cocagna* or Castle, built according to the rules of fortification, and faced all over with pieces of beef, bacon, hams, geese, turkeys, and other provisions, with which the imaginary country of Cocagna is said to abound; where the very trunks or branches of trees are supposed to be Bologna sausages. This welcome spectacle is exhibited once a-year; and on each side of the castle is a fountain running with wine during the whole day. A party of soldiers is posted to restrain the ardour of the populace till the viceroy appears in the balcony, which is the signal for the assault.'

Having shown that the 'Cockney Country' meant, ever since the thirteenth century, a land of good cheer, we proceed to state how London came to be distinguished by that flattering appellation. Hicks, in his Anglo-Saxon grammar (vol. i. p. 254), explains the connexion by remarking that the nick-name Cockney, or inhabitant of Cockaigne, was used by the French in early times to designate an ease-loving, gluttonous in-

dividual. This term was generally applied by the rural population to the inhabitants of towns and large cities, because—devoted to sedentary employments—they were supposed to obtain the means of a more luxurious life by little exertion. When, therefore, London rose to importance, it was looked upon as a city overflowing with wealth and luxury—a sort of Utopia. This idea took its rise, not unreasonably, from the extraordinary privileges which the citizens exacted from the earliest kings of England in return for the loans of money which they constantly made to the crown. Indeed, up to the protectorate of Cromwell, to be a Burgess of the city of London was to possess privileges and immunities of real pecuniary and social value. It is no wonder, then, that the less favoured part of the population should give to the metropolis attributes not very dissimilar to those of the imaginary country of Cockaigne, and should thence call its citizens 'Cockneys.'

We learn from Dugdale that this nick-name was applied to Londoners at a very early period. The lawyers of the Temple had a feast held on Candlemas-day (28th December), over which a character called king of the Cockneys presided. It would appear, from orders issued by Henry VIII. in 1517, that this rival majesty had taken unto himself a few not very proper privileges, and that his subjects had occasionally exceeded the bounds of good order, for the bluff monarch enjoins that 'the king of Cockneys, on Childermas-day, should sit and have due service; and that he and all his officers should use honest manner and good order, without any waste or destruction making in wine, brawn, chely, or other vitails; and also that he, and his marshal, butler, and constable marshal, should have their lawful and honest commandments by delivery of the officers of Christmas, and that the said king of Cockneys, no none of his officers medyl neither in the buttry, nor in the Stuard of Christmass his office, upon pain of forty shillings for every such meddling.' This custom seems to have been discontinued after the great rebellion.

To be a true Cockney, a person must be born within the sound of the bells of Bow Church, which, being situated in the centre of the city, could be heard in every part of it. For in those quiet times, when this condition to the title of Cockney was imposed, there were few carriages in the streets to drown the peal, locomotion being performed either by means of the river Thames, or by horses on soft unpaved streets. In other words, then, a Cockney must be born within the walls of the city.

That an unusual love of good eating and drinking, and the ability to indulge in the pleasures of the table, has perpetuated the designation to the Londoners, is scarcely to be doubted. The capital of England has always been the metropolis of good fare. The lord mayor's feasts have been celebrated for their profusion from the days of William the Conqueror. We have seen the bill of fare of a regal banquet given to the court of Edward III., on the occasion of a tournament held in Cheapside, which would excite the longings of a modern alderman. Nor has the lustre of these celebrated feasts been dimmed by the lapse of four centuries: on the contrary, all the refinements of the foreign *cuisine* have been added to the substantial roast beef of old England; of which several 'barons' were prepared alike for the royal appetite of the third Edward, and for illustrious visitors who graced his lordship's tables on the 9th of November last past; that substantial 'piece de resistance' having been from the earliest ages as necessary to a Guildhall dinner, as the mace to the induction of a new lord mayor, or the regalia to a coronation.

High feeding being so intimately connected with the office of chief magistrate, it is no wonder that it should extend its influence over the lesser functionaries and inhabitants of the city. This influence is so potent, that even to this day—when the salient characteristics of the genus Cockney are worn down and rounded off by the attrition of travel and extended intercourse—the

main peculiarity of the Londoner is his extraordinary solicitude to keep his digestive organs in action. The blessings and evils of this life are referred by him to food. By the capability a man possesses of giving good dinners, he judges of his affluence; and in the lower ranks of Cockney life, a neighbour's private circumstances are invariably judged of by the nature and quality of his Sunday dinners. The beggar who appeals to the true Cockney by an assurance that he is hungry, or that he has a wife and seven starving children, is sure of relief; for of all the endless variety of forms which human suffering takes, none is so shocking to his sympathies as starvation. Some years ago, during the banishment of Napoleon Bonaparte to St Helena, a gentleman connected with one of the London journals happened to draw, in the presence of a Cockney, an over-wrought picture of the ex-emperor's sufferings: he mentioned his sudden reversal from boundless regal splendour to the narrow conveniences of a remote island—torn from all those he held dear in his own country—pining in obscurity, neglected and forlorn. Here the sympathising listener supplied from his own imagination a finishing touch, 'And then, poor fellow,' he exclaimed, 'perhaps *he's short of victuals too!*' Beyond this

'The force of misery could no further go,'

and the kind soul was visibly affected.

Of lesser Cockney characteristics few traces remain. The Londoner of twenty years ago having every hour of his time fully occupied in the great business of existence, had little leisure for comparing his own knowledge or ideas with more extensively-informed men; and as his intercourse lay chiefly with fellow-Cockneys, his notions were bounded, as it were, by the bills of mortality. London being acknowledged by everybody to be the greatest of cities, its inhabitants, he reasoned, must be the greatest people in the world. Hence Cockneys constituted themselves and their city a standard by which to judge of everything else in nature. Whenever they had to make a simile, one member of the comparison was sure to be something belonging to themselves or to their native Babylon. A Cockney who, by some extraordinary train of events, found himself at the summit of one of the Alps, would be less struck with the stupendous grandeur of the scenery, than with the glorious exaltation of finding himself

'Ninety-nine times as high as St Paul's.'

Place him in the Polar regions, and he would measure the thickness of the ice not in inches, but by its being so much thicker than the ice in the Serpentine or in the London Docks. It is characteristic of a Londoner, also, that his comparisons will be always in favour of London and its attributes. 'The best of everything,' he tells you, 'exists in London.' A city shopman, having been pressed into the sea-service, and captured by the French, described in a letter to his friends the horrors of his prison, mentioning that it was overrun with rats: 'but they are lean, half-starved wretches,' he added; 'and nothing to compare to our London rats.'

This pardonable prejudice in favour of the great metropolis abated, the Londoner is generally acknowledged to be far above the ordinary run of mankind in shrewdness. Constantly moving amidst the most bustling of life's scenes—revolving in a whirl of occupation—he knows the value of time, and makes the most of it. Hence he is quick in his observations, in his motions, in his speech. He sees at a glance what others dawdle and ponder over. He begins and finishes a transaction while a provincial rival is 'turning the matter over in his mind.' His questions are categorical, and his replies direct and decisive. In trade, he loses but little time in buying and selling. 'That's my price,' he will say, if he be a purchaser; 'take it or leave it;' and according to the reply, so he buys or not; but the affair must be settled in a minute. He

eats, walks, and even takes pleasure in a hurry. These habits render the Londoner rather pert and authoritative in his manner to strangers; but without his meaning to be so, for it is natural to him. To contradict him is to excite, instead of anger, pity at the dissenter's ignorance; for it is his comfortable creed, that all who disagree with him are in the wrong.

As the rustics retain their local dialects, so uneducated Londoners (amongst which class real Cockneys are now only to be found) cling, with a fondness which no intercommunication can subdue, to their peculiarities of speech. They have a great aversion to the aspirate *k*, and so obstinately substitute the *v* for the *k*, that where the *k* gets a double sound, they put themselves to the trouble of inserting the *v*, even if it be in the middle of a word. Thus they prefer saying *kvarter* to quarter, and *kveer* to queer. Present participles are not considered complete without a prefixed *a*: hence they are invariably *a*-coming or *a*-going. It is in London, also, amongst the lowest orders, that the basest of coined words—*alang*, is most used.

As we have before remarked, Cockneyism is fast wearing away. Facilities of intercourse with the provinces and with foreign countries,

‘Modestly discover

That of themselves which yet they knew not of,’

and have thus taken from Cockneys their self, or rather city esteem. Still, they retain the quality from which they derived their appellation; for now, as ever, the best dinners and the best feeders in the empire are to be found within a radius of two miles of the Royal Exchange.

THE FIRST LADY OF LORETTO.

BY FRANCES BROWNE.

‘NEVER HAVE I seen the carnival so joyously celebrated, nor the devotions of this holy day so carelessly attended,’ said Cardinal Montalto to his faithful servant Ludivico, as they stood together on the evening of the first day of Lent under the vast and now silent dome of the great St Peter’s.

Cardinal Montalto was one to whom even the conclave looked up with reverence; his great learning—for he was esteemed one of the best theologians of his time, and skilled in the most abstruse questions of controversy—was equalled only by his zealous and somewhat ascetic piety, which eminently qualified him for his office of consultor of the Inquisition, and peculiarly recommended him to the favour of the reigning pontiff, Gregory XIII. His life was without reproach, and his orthodoxy above suspicion; yet it seemed that there was less of love than fear in the deference with which the cardinal was almost universally regarded. He had wrought his way up, it was said, from a very humble origin, through the austerities and labours of the Franciscans, whose vows he had taken while yet a child, but had ever been looked on less as a brother than a censor of the order; and now, though their vicar-general and controversial champion, of whom the brethren might well be proud, they loved him as little as they had done twenty years before, when, as Fra Felix Peretti, he had been driven from their convent in Venice for his censorious sanctity. It was even supposed that the honours which his holiness showered upon him were rather bestowed for the good of the church than the love of the man; for the easy and cheerful character of the old pope formed a strange contrast with the zeal and austerity of the cardinal, whose piety belonged rather to the iron than the golden age of religion. Yet there was one individual of all Montalto had ever known, and of all who had ever known him, though many they were, of high and low estate, and only one who loved him, and whom, if he did not love—for there seemed no room for the gentler affections in his strong

nature—at least he trusted, and that individual was his servant Ludivico. How long he had been in the cardinal’s service, none in Rome could tell, for his master and he had grown gray together, and years had made them friends; but, saving that both were natives of the March of Picena, there seemed no other bond of union between them, for Ludivico had no share in either his master’s zeal or piety, but was still an honest and faithful peasant, as he had been born; more strict, indeed, in the performance of his devotional duties than most peasants of the period; but that was by command of his master, and Ludivico knew no other law.

The last tinge of sunset was fading from the modern palaces and old eternal ruins of Rome, and the gray of the deepening twilight filled the vast but deserted temple in which they stood. The cardinal had that day officiated as the pope’s own substitute (for such tasks of late had often devolved on him, as the increasing age and infirmity of Gregory seemed strangely augmented since the last intimation he received of the weakness of the pontificate in the celebrated bandit Marianazzo’s refusal to accept a pardon from his hand); but the last of the worshippers had departed, and nothing remained in the great church but the lamp still burning on the altar, and the cardinal, with Ludivico behind him, his tall figure slightly bent as he leant upon his staff, and his dark immovable countenance turned with an earnest look of old recollection to a beautiful picture of the virgin that hung immediately above the shrine. Many an eye, indeed, had turned with admiration to that picture as well as that of the cardinal, but none with the same gaze of memory; and never did he enter the church of St Peter, whether as a preacher or a hearer, but his first look was there; and never did he leave the holy place, no matter in what haste, without lingering to bestow a farewell glance on the picture of Picena, for so it was called, and said to be the work of an obscure and unknown artist, who had sent it as a pious present to the church, in the same year that Montalto was made cardinal.

‘It is growing late, my lord,’ said Ludivico, who had often glanced at the door, and hemmed, in the vain hope of breaking up his master’s reverie, which seemed on this occasion to be deeper than usual—‘it is growing late, my lord: were it not well to return to the palace?’

‘Thou art right, Ludivico,’ said the old cardinal starting; ‘it is indeed late, and we are left alone here. Not a single votary lingers to pray at the holy shrine; nay, not even a priest remains to refresh his spirit by pious contemplation in this most holy place. Oh, Ludivico, it is a degenerate age; the zeal and sincerity of the early times are departed; and even at this sacred season, men give themselves up to the world, as if it were not dust. Not such were they, the men who built this temple, or planned it, before there was a schism in the church, or heresy in Europe. Minds were mighty and sleepless in those days. Look around thee, Ludivico; was there not a shadow of eternity on his soul who planned this glorious building? But the world is growing weak, and we have no Angels now.’

‘Truly no, your eminence; they’re all gone astray, doubtless, with the rest of the heretics; and this is a very nice church, and a very great church. But oh, my lord, it is growing late.’

The cardinal looked at him with a compassionate gaze, and said, ‘Ludivico, how long hast thou served me?’

‘Thirty-five years, your eminence—thirty-five years exactly, all but the three weeks two days and four hours which I served the Marchese de Colonna, when your highness cast me off for forgetting to fast on Good Friday.’

‘True, true, Ludivico, that was a grievous sin; but thou hast repented.’

‘I have indeed, my lord; but will your eminence return to the palace?’

‘In a moment, Ludivico; but look for me at this pic-

ture, and tell me, on thy true love and faith, if thou hast ever seen face or form of mortal mould that resembled it?"

Ludivico gazed long and steadfastly at the picture, though he had done so often enough to know every hair upon the virgin's brow; but implicit obedience had become a second nature to him, and he answered, "As I am a Christian, my lord, I know not any whom this picture resembles excepting, with great humility to the virgin and your eminence, the bandit Marianazzo."

"What!" said the cardinal with astonishment, which was not often expressed on that calm and stern face, "he who hath lately insulted the most holy chair of St Peter by refusing pardon from his holiness? Well hath the Scripture said, "cast not your pearls before swine;" and truly the states of the church are now infested by swine, worse than the possessed herd which ran into the sea. It becomes not us to speak lightly of our holy father the pope; but were I in his place," said the cardinal, as his voice sunk low and he swept the darkening church with an anxious and hurried glance—"were I in his place, no bandit should be offered pardon. Verily, I would use the sword of St Peter to root them out, together with all heretics and infidels; and then would the church prosper. But I am an old man hastening to the grave, and the burden of such a mighty trust is more than ought to be desired." Montalto spoke the last words in a louder tone; but there was something in his eye that belied them, and Ludivico answered,

"My lord, I have heard your eminence called Fra Felix Peretti, then bishop of St Agatha, next Vicar-General of the Franciscans, now Cardinal Montalto; and in my soul I believe I will live to hear them say your holiness yet."

"These are vain thoughts," replied the cardinal; "yet my father had a dream, and I also have dreamt; but all things are in the hand of God. But, Ludivico, where hast thou seen the bandit Marianazzo?"

"When I served the Marchese de Colonna, he travelled with his daughter, the fair Donna Alonzina, to Naples with a strong escort, and I was one of the train; but the robbers surrounded us on the road, and all our armed men fled, for none could stand before the bandit of Picena. Marianazzo himself was there. But the virgin preserved us doubtless for the piety of the fair flower of Colonna, for so I have heard the donna called; for the bandit took nothing of all the marchese's wealth but a small gold ring from the fair lady's finger; and none but the virgin could turn the heart of a robber from so much riches. Truly, it is sad to think that Marianazzo is a bandit, for he is stately in form and noble in bearing, and his face is so wondrous fair. Oh, your eminence, it is mighty like that picture! But to go on with my story. The bandit left us with many fair speeches and graceful bows to the Donna Alonzina and her father, and, better than that, three good handfuls of gold, which he cast to us poor servants with the air of an anointed sovereign. And we proceeded safely to Naples, from whence your eminence graciously recalled me. But I have heard them say that Donna Alonzina never recovered the fright of that day, and has refused to wed a most noble husband, because of her earnest desire to take the veil. Indeed your eminence may remark her great devotion, for all day long her eyes were never from that picture, and she often comes hither to pray before it."

"Well she may," said the cardinal, with a vehemence which he seldom displayed—"well she may, for it hath a most glorious brow; and yet, Ludivico, I saw one of which it is but the shadow. Listen; thou hast served me well and faithfully ever since the days of my poverty, when I was but a friar; but thou knowest not the darkness of my earlier days, when I watched the swine in the fields and the fruit in the gardens of Fermo. My father was a poor Dalmatian exile, to whom Heaven had given only a heritage of hope for his son. He dreamt, Ludivico, of more than the purple for me; but poverty was upon him, and the old man pined night and day,

because he could not spare the five bajocchi* demanded monthly by our village teacher; and I, to whom time promised so much, sat by the fountain at the wayside, and learned my first lessons from boys who passed to school. Not far from that fountain, in the garden which I watched, there stood the broken columns of an ancient temple, where the old forgotten race had worshipped one of the demons that in early times had power over the heathen. But its altar was broken down; for time had made it desolate, and vine and ivy had twined around the columns, and summer covered them with a veil of flowers. I had heard the peasants tell of ancient treasures hidden in those pagan temples; and with a childish hope of finding something to relieve our poverty, I once went there alone early before sunrise. The dew was on the tangled weeds and wild flowers that covered what once had been its marble pavement; but my thoughts were full of the hidden treasure, and stooping at a spot which sounded hollow, I began to dig with my father's spade, when a sound of rustling came faintly through the vines. I looked up with fear—for there are strange voices and shadows that pass yet over these unhallowed places—but a mortal woman stood before me. Ludivico, I have looked on many a face and many a strange scene since, but the memory of that stranger, seen so long ago, is with me yet fresher than them all, and it rises at times upon my dreams, bringing back through many parching years the morning breath of my childhood, that seems like a far-off land of spring, whose light lies behind me for ever. I have prayed—for it seemed to me there was sin in the thought, for it ever came with a longing to see that face once more—and at last it did depart from me; but that picture has brought it back upon mine age. Yet, Ludivico, it is not a dream of sinful vanity. But would that, ere the grave closed over me, I could learn that some blessing had repaid the hand that relieved my first cravings, for I have never been able to trace out her habitation, and long ere this she must be gathered to her place."

"But, your eminence," said Ludivico, "what good work did the stranger do, for no doubt it will be remembered to her in judgment; and with the aid of your eminence's prayers, she may have reached heaven ere this?"

The cardinal groaned deeply, as he answered, "Have I not taught thee that the good works of heretics and infidels avail not, and no prayers can avail for them? but thou art ignorant."

"Truly I am, my lord," as a beast. But what did the stranger do?" answered Ludivico, whose absolute submission to the will of his lord was in this instance equalled by his curiosity, and horror too; for he added in the same breath, "Holy Virgin, preserve me! I knew not that she was a heretic."

"Thou didst not, good Ludivico," said the cardinal in a more kindly tone; "but listen—the lady smiled on me, for I was then a child, and inquired what I came to dig for there, and in my simplicity I told her all my father's poverty, and my own wish to learn. She was not rich, Ludivico, as I afterwards discovered; but while I spoke, she drew out a little purse, and gave me from it five silver florins—I am sure it was the half of all it contained—and oh what treasures mine eyes have looked on since. And I have had dreams, Ludivico, great dreams, of gathering heaps of gold for the service of the holy church; but nought of all I have ever dreamt of or possessed could give me such gladness now as the sight of those five florins did then. I could not speak for very joy, and strange visions of hope came thronging upon me, bright but indefinite; and the lady seemed to guess my thoughts, for she said something in her own strange language, and walked away. When I came to myself, indeed, I tried to overtake and thank her, but could not, for she was gone from my sight, and I hurried home with the florins to my father. There was great joy in our cottage that day, and next morning I went

* See the history of Sixtus V. in Ranke's *Lives of the Popes*.

to school. At noon the scholars went home, and I returned by the way of the ruined temple—the lady was there standing in the same spot beside the broken altar. I hastened to her and poured out my thanks, and in my young heart's gratitude—for, Ludivico, I was young then—I promised I know not what return to her goodness in future years. The lady bade me cease; for she was not then alone, but held an infant boy by the hand, like herself, and wondrous beautiful. Young peasant, she said, I know that thou wilt come to great power and fortune; and shouldst thou meet this boy in after days, for his stars are not so prosperous as thine, remember then the kindness of his mother, and know him by this sign. As she spoke, she drew up the sleeve of the child's tunic, and showed me upon his right arm the picture of a serpent in many coils of dark blue, painted, as it were, into the very flesh. No wave, she said, could wash out that strange picture, for it was painted in her native land by one who knew the early arts of Greece; for I have learned she was a Grecian lady of most noble birth, and niece of the patriarch of Constantinople; but she wedded a Jew, and renounced her Christian faith, and the heavy curse of the eastern church was upon her. Why she came to Italy I never knew. Perhaps it was to avoid the wrath of the eastern Christians: but her Jewish husband had died of the plague, and she was alone with her child and an ancient Greek servant, who had followed her from her father's house. The peasants had strange tales of her at Fermo; for it was said she had turned not to Judaism, but the old idolatry, and therefore frequented that ruined temple. Our bishop began to inquire concerning her, and then she left the place and went to Venice.

'Perhaps the holy Inquisition converted her, my lord?' broke in Ludivico.

'No, no,' cried the cardinal; 'I have been consulter these fifteen years; but they told me she had gone to Spain, and sailed from thence to the far west in a ship of the Conquistador's; but a great tempest met them on the sea, and the ship went down with all that it contained near the coast of Barbary. But many a thought I have had, Ludivico, concerning that strange woman; and would that I knew the painter's name whose hand hath given the church that glorious picture, for assuredly it is but a copy of her face, and the sight was pleasant to me; for I have thought, perchance it was but a delusion, that it betokened grace to her son: but thou sayest it also resembles the bandit Marianazzo?'

'On my salvation it does, my lord, if mine eyes were not deceived,' said Ludivico.

'It may be so, it may be so,' rejoined the cardinal; 'this earth hath strange resemblances: yet I could wish thou hadst not spoken of the thing, for hitherto I have looked upon that picture with much of memory and something of hope; but henceforth it shall seem to my spirit like an altar overturned and a sanctuary profaned.'

'Oh, my lord, it is my greatest grief to have spoken aught that may offend your eminence; yet, believe me, it is true.'

'No doubt, no doubt, good Ludivico,' was the cardinal's reply to the humble remonstrance of his servant. 'But it grows late: let us return home: and, Ludivico, see that you mention nothing of what I have spoken.'

'Not a word, my lord,' said Ludivico; who, though simple as a child in all other matters, was known to be a most impenetrable secret keeper from all but his master.

'But sure,' he continued, as the cardinal glanced sadly back, 'when your eminence comes to be pope, your commands will be sufficient to have this virgin taken down and another fairer one painted in her stead.'

'Who told thee, Ludivico,' said Montalto—but there was pleasure in his look in spite of the stern tone—'who told thee that I should be pope?'

'Craving your eminence's pardon, I humbly confess it was a Bohemian fortune-teller at Fermo many years ago.'

'The Bohemians are heretics, and no Christian should consult them,' cried the cardinal with real anger.

'Oh, my lord, I fasted three days, and said three hundred aves for it. But nevertheless I am sure it is true; and would that I were as near a cardinal's hat as my master is to the triple crown of St Peter.'

'When I am pope thou shalt be cardinal, my good Ludivico. Meantime, see that thou keep thine own secrets, and watch over thy soul; and with these words the cardinal and his servant passed together from the portal of St Peter's.

Five years had passed away, and they had left strange traces on both the faces and fortunes of Ludivico and his master, when they stood together again at the close of another day. But the last gleams of the twilight now shone through the high-arched windows and stately old chambers of the Vatican upon Pope Sixtus V. and Cardinal Gallo. The day had been one long to be remembered in the annals of Catholic Rome, for in it the dream of many a pope had been accomplished, when, amid the music of the Roman choirs, the thunder of cannon, and the shouts of Italy, the old Egyptian obelisk, raised from its resting-place, where the memory of the Cæsars had hung around it for fifteen hundred years, was placed, as an offering to its faith, in front of the great temple of the Christian world. All was over, and the hush of coming night had fallen upon the eternal city: the people were gone to their homes, and the princes to their palaces; but the wearer of the triple crown still stood, like one whose work was yet unfinished, near the window of a great hall, whose high old shelves and long closed cases rose to the height of the ceiling, piled up with ponderous volumes and manuscripts gathered from the libraries of nations whose very capitals were dust. It was the library of the Vatican; and the pope who stood there had more to think of at that hour than books.

'Ludivico,' said he, addressing his companion by the name of former days—for elevation had wrought little change in their intercourse, though Sixtus had kept his promise to his servant, even in spite of the eloquence of Francis Toledo,* and Ludivico was now his eminence—'Ludivico, much yet remains to do. With help, I have put down the bandits. No heretics dare show themselves in the states of the church; and the Catholic princes will soon take up the sword against the Lutherans. The treasure also in the vaults of St Angelo grows apace, and the new city of Loretto hath risen to glorify the virgin; but, Ludivico, the matchless image which I intend for the church of the blessed Madonna, hath it been brought to Rome?'

'It is come, my lord your holiness,' replied the new-made cardinal, who never could recollect in time the more exalted title of his former master.

'It is well,' said Sixtus: 'and hast thou conveyed it, as I desired, to the treasure-vault of St Angelo, that no man may open the case or look upon it save ourselves? For if it excel not all the statues of the Capitol, which, thanks be to God, are now removed, to pollute our holy city no more with the remembrance of pagan idolatry—I say, if this image excel them not, it shall never have a place in the church of our lady of Loretto.'

'Doubt not, my lord—I mean your holiness—that the image is a most excellent virgin, seeing the sculptor hath pledged his life upon the work, and sent it expressly from Florence for your holiness's inspection.'

'Would it may be so, Ludivico,' continued Sixtus; 'and may the virgin accept my great works in her honour. And now the promise of my father's dream has been fulfilled: I am pope; and thou, too, in spite of the Jesuits, art a cardinal: but, Ludivico, I am old; yet would that I might live to behold the great cupola of St Peter's finished, and see the head of that wicked one, Jazino Marianazzo, set up on a pole at the gate of

* This Jesuit preached a sermon against Pope Sixtus V. for having elevated his servant to the rank of cardinal.

the Vatican. Ludivico, hast thou heard anything of that accursed one of all the bandits? He is the last who defies our power, and the one, above all others, whom we long to bring to justice; but no doubt God will destroy him. Yet would I might see the church delivered from all her enemies. But now is the time: give me my cloak, Ludivico; and the cardinal mechanically obeyed with all the alacrity of his servant days. 'Now, let us go,' continued Sixtus; 'this key will allow us to pass by the secret door to avoid observation.'

As the pope spoke, he drew out a small and singularly-formed key, which seemed rather for ornament than use, for it was made of gold. But golden keys have been powerful at all times; and, applying it to what seemed a small chink in the door of one of the book-cases, it opened without a sound, disclosing a narrow passage, through which Sixtus and the cardinal passed together. At the end of it was an iron grate, which the pope opened by touching a secret spring concealed in one of the bars, and then they descended a flight of steps, and passed on through another passage, so long and dark, that Ludivico thought they would never reach the end of it. At length, the light of the lamp which Gallo carried fell on what seemed to him a thick wall; but Sixtus, after a moment's pause, in which he looked anxiously behind him, once more applied his golden key to an almost invisible chink, and then, without a sound, a small narrow door opened, and they descended together down a few steps, and Gallo found himself in the treasure-vault of St Angelo. The holy fortress, as it was called, was at that time the repository of the pope's wealth; and the subterraneous passage which extended from it to the Vatican, was said to be often trodden by the successor of St Peter, who constantly kept the key, with as tenacious a grasp as the mystic ones of his office.

There was a wild brightness in the old man's eyes as he gazed on the great iron chest, dedicated to the Holy Virgin by an inscription deeply cut on its ponderous lid; for it contained more than three millions of golden scudi. Besides that coffer, there was no furniture in the chamber, nor any article but the long wooden case containing the image destined for the church of Loreto, which had been conveyed hither for the pope's private inspection. After satisfying himself that all was safe in that impenetrable chamber, Sixtus turned to his cardinal, who stood astonished at all he saw.

'Come, Ludivico,' said the pope, 'let us open this,' and he handed him the key, which as usual had been in his own safe keeping. Gallo placed the lamp on the floor, and applied the key; but the lock was deranged, and he could not get it opened; and Sixtus, who, with all his piety, had never been remarkable for the virtue of patience, pushed him away, exclaiming testily, 'I cannot endure thy awkward delay. I will open it myself.' As the old pope spoke, he gave the key one vigorous turn, and at the same moment the lid flew up, and a man dressed in the usual style of a bandit leader, and fully armed with sword and pistol, bounded from the case, and rushed to the door.

Sixtus called loudly to the Virgin, and Gallo stood petrified; but the moment he recovered his speech, the poor cardinal exclaimed, 'Call louder, my lord your holiness, for as I am a living man it is Jazino Marianazzo.' The bandit had by this time firmly closed the door, and planted himself against it; and Sixtus, who was the first to regain his presence of mind, was struck by his singular beauty. He was a tall dark young man, with long and rich black hair; but when the old pope raised the lamp, and the light of it fell full upon his face, the fear and the astonishment seemed to pass away before some deep dream of memory which that countenance recalled. Gallo shouted, 'Oh, my lord, did I not tell you true; does he not resemble the virgin of Picena? But, for the holy Madonna's sake, great signor bandit, do spare our lives.' And Gallo cast himself on his knees at the bandit's feet.

The proscribed leader looked down and almost smiled,

but motioned him to rise; and then turning to Sixtus, who still stood gazing upon him with that earnest look of recognition, 'Holy father,' said he, 'fifty long years ago, a Grecian lady, of whom I am the only living heir, bestowed upon your holiness the sum of five silver florins, which you promised to repay if ever it should be in your power; and now, in your treasure-chamber in the castle of St Angelo I come to demand payment not only of the sum lent, not only of the interest it has borne in your hands, but also of the free good-will with which it was given—of the generous charity that gave its mite when there was only a mite remaining. This is the only inheritance bequeathed to our family, and I am its last descendant. Behold the sign!' At the instant the bandit exhibited his bare right arm, on which the figure of a serpent was represented in a dark blue circle, as if twisted round the limb.

'And art thou, then, the child that stood by the altar?' inquired Sixtus earnestly; 'and tell me where is she?'

'My grandame—rest her soul—sleeps on the desert coast of Barbary, where she and her son were shipwrecked many years ago; and I am that son's child, brought up among the Jews of Fez, amongst whom my mother, a Roman lady of the noble house of Ghishin, found refuge from slavery, to which she was brought by a corsair of Algiers; and I have been a bandit in my mother's land. What other portion was there for me? My father died fighting for the cause of Christian Spain; and my mother sleeps in her own land, though not in the vaults of her family. But I was an outcast, for whom there was no place in the path of honour. And now, holy father, make good your promise, and pay me, if thou canst, all that I demand.'

'Oh, my lord, your holiness, pay him—pay him!' vociferated Gallo. 'Is there not gold enough in the chest?'

'Peace, profane wretch!' cried Sixtus, for the master chord was touched. 'I cannot touch the treasures of the Holy Virgin.'

'Pope,' said the young bandit, 'gold I want not: there is gold enough in this world for the winning.'

'What, then, dost thou ask?' demanded Sixtus.

'Two things,' said Marianazzo: 'first, a free and unconditional pardon for myself and all my followers; and secondly, a line or two from your holiness to the abbess of St Theresa, regarding the novice Donna Alonzina Colonna, that she may depart unquestioned from the convent with the bearer. This is all I at present require; and whatsoever your holiness is pleased to add in your sovereign liberality, shall be gratefully received.'

'Holy virgin,' said the pope, 'thou hast been a grievous enemy to the church; nevertheless—and the old man paused, and looked again long on the bandit's face—there is a beauty on thy brow which hath hung long about my memory; and for the mite that had the wealth of my life's hope in it, and for the joy it gave my childhood, which no wealth can give my age, and, more than all, for the long-remembered one who gave it, I grant thy request. But, alas, alas! I fear it is a grievous sin.'

That night, it was said, the pope and his favorite cardinal kept vigil in the chapel of the Vatican, and the nuns of St Theresa were roused before the break of day by a loud knock, and a solemn mandate from the pontiff for the novice Alonzina Colonna instantly to repair to Rome. Great was the amazement of the convent; but the lady went with the messenger, who brought a noble escort of well-armed and mounted cavaliers; and many a day the abbess waited to hear tidings of her novice; and news came at last, which said that the noble maiden had been married to an unknown stranger, in the chapel of the Vatican, by the Cardinal Gallo. There was great gossip in Rome; but they talked of it in whispers; for no one cared to speak aloud of things which the stern pontiff chose to consider secret. But from that night the bandit Jazino Marianazzo was never seen, but there was a brave Italian knight, who did good service

in the war against the Huguenots in France, whose lady was said to be the fairest in Christendom, and sprung from the noble house of Colonna.

There was great rejoicing among the pious inhabitants of the new city of Loretto, when Sixtus V., with all his train of cardinals and bishops, came to consecrate the great church, and set up the image of the Virgin, which had been found one morning at the gate of the Vatican; though the Florentine sculptor declared, on his salvation, he had sent it in a case to Rome with a special escort, and secretly, as his holiness commanded. But the pope had made no inquiry into the affair, and the populace thought the Virgin had a right to come as she pleased. And Cardinal Gallo whispered to his confidential servant, 'Pray Heaven we may see no more images as troublesome as the First Lady of Loretto.'

GLASS.

THE new financial arrangements of the legislature, by which the price of glass will be greatly reduced, afford us a fit occasion for presenting our readers with some of the many interesting facts connected with that important and beautiful article.

Glass is formed by mixing together some sort of silicious earth, such as fine sand or pounded flint, with an alkali (soda or potash), and subjecting them to a strong heat. Concerning its origin, an interesting anecdote is narrated by Pliny, which, without much examination as to its probability, has been taken for granted, and copied into all the encyclopædias and treatises on glass that have been written for ages. We give it in the quaint words of an early English translator.* 'The common voice and fame runneth, that there arrived sometime certaine marchants in a ship laden with nitre, in the mouth of the river Belus, in Phœnicia, and being landed, minded to seeth their victuals upon the shore and the very sands; but for that they wanted other stooves to serve as trevets to beare up their pans and cauldrons over the fire, they made shift with certaine pieces of sal nitre (saltpetre) out of the ship to support the said pans, and so made fire underneath; which being once afire among the sand and gravel of the shore, they might perceive a certaine clear liquor run from under the fire in very streams, and hereupon they say came the first invention of making glasse.' From the context, it is deduced that the time of this accidental discovery of glass was supposed by Pliny to be about the Christian era. The recent discoveries of Sir Gardner Wilkinson, however, in the tombs of Thebes, make it certain that the Egyptians were in full possession of the various modes of glass manufacture upwards of 3500 years ago. The process of glass-blowing is represented on the paintings of tombs of the time of Osirtasen I. and his successors, and repeated in various parts of Egypt in tombs of various epochs. 'But,' continues Wilkinson,† 'if the sceptic should feel disposed to withhold his belief on the authority of a painted representation, and deny that the use of glass could be proved on such evidence, it may be well to remind him that images of glazed pottery were common at the same period, that the vitrified substance with which they are covered is of the same quality as glass, and that, therefore, the mode of fusing, and the proper proportions of the ingredients for making glass, were already known to them; and we can positively state, that 200 years after, or about 1500 A.C., they made ornaments of glass; a bead bearing a king's name who lived at that period having been found at Thebes by my friend Captain Henvey, R.N., the specific gravity of which, 25 degrees 23 minutes, is precisely the same as of crown glass now manufactured in England.' Many glass bottles and objects of various forms have been met

with in the tombs of Upper and Lower Egypt, some unquestionably of very remote antiquity, though not readily ascribed to any fixed epoch, owing to the absence of royal names, indicative of their date; and glass vases, if we may trust to the representations in the Theban paintings, are frequently shown to have been used for holding wine, at least as early as the Exodus, 1490 years before our era. Such, too, was the skill of the Egyptians in the manufacture of glass, and in the mode of staining it of various hues, that they successfully counterfeited the amethyst and other precious stones, and even arrived at an excellence in the art which their successors have failed to retain, and which our European workmen, in spite of their improvements in other branches of this manufacture, are still unable to imitate; for not only do the colours of some Egyptian opaque glass offer the most varied devices on the exterior, distributed with the regularity of a studied design, but the same hue and the same device pass in right lines directly through the substance; so that, in whatever part it is broken, or wherever a section may chance to be made of it, the same appearance, the same colours, and the same device present themselves, without being found ever to deviate from the direction of a straight line, from the external surface to the interior.

In later times—when Egypt was under Roman dominion—there existed an extensive manufactory of glass in Alexandria, from which the whole of the western world was supplied. According to the eminent German antiquary Wincklemann, it was used for a greater variety of articles by the ancients than by the moderns. Glass was not only made into beads, bottles, cups, and other household utensils, but was used for mosaic work, for sacred emblems, and even for coffins.* Of this material was made the Barberini, or, as it was usually called, the Portland, vase, which was some months since so wantonly destroyed by a visitor to the British Museum.

From Pliny it is ascertained that glass was made extensively in Rome long before the days of Nero (who died A.D. 68); for that tyrant is said to have given the enormous sum of £50,000 (6000 sesterces) for a couple of two-handled glass cups. They are said to have been of immense size and exquisite workmanship.

The art of making glass was introduced into England, it is supposed, as early as the year A.D. 663. Benedict, the abbot of Wearmouth, procured men from France who not only glazed the windows of his church and monastery, but, we are assured, instructed the Anglo-Saxons in the making and painting of glass. The first regular window-glass manufactory of which we have an authentic account appears, however, to have been commenced in Crutched Friars, London, A.D. 1557. Soon afterwards, five articles of flint glass were made in Savoy House, Strand. In 1635 great improvements were introduced by Sir Robert Mansell, by the use of coal instead of wood. The first sheets of blown glass for looking-glasses and coach windows were made in 1663, at Lambeth, by Venetian artists, employed under the patronage of the Duke of Buckingham. The casting of mirror-plates began in France about the year 1688, by A. Thevart. They were soon rivalled in excellence and cheapness by the English. Still, it was long before glass was used for windows; and though it cannot be a matter of surprise that the ancient inhabitants of warm climates should never have adopted glass windows, yet there were seasons even in Rome when her inhabitants were glad to shut out the too keen air without being deprived of light. The Romans were contented with the cheaper article of *talc* instead of glass for that purpose. But we naturally are disposed to wonder why, in a climate such as our own, glazed windows were not introduced earlier than they were. So essential a comfort are they in our present estimation, that most of the ideas of luxury with which the nations of antiquity are associated, vanish from our minds when

* Holland's Plinie, book 36, chap. 26.

† Manners and Customs of the Ancient Egyptians, vol. III.

* The body of Alexander the Great is said to have been enclosed in a glass coffin at Alexandria.

we reflect that in cold weather they could only exclude air at the expense of light. There is no authentic evidence of glass being used in windows previously to the third or fourth century; and then, and for long after, it was employed only in churches and other public buildings. In this country, even so late as the latter part of the sixteenth century, glass was very rarely met with. In a survey of Alnwick Castle, the patrimony of the Dukes of Northumberland, made in 1573, it is stated—'And, because throwe extreme winds, the glasse of the windowes of this and other my lord's castles and houses here in the country dooth decay and waste, yt were good the whole leights of everie windowe, at the departure of his lordshippe from lyeinge at any of his said castels and houses, and dowing the tyme of his lordship's absence, or others lyeinge in them, were taken doune and lade up in safety. And at soochie time as ather his lordshippe or anie other sholde lye at anie of the said places, the same might then be set uppe of newe, with smale charges, whereas now the decaye thereof shall be verie costlie and chargeable to be repayed.' Sir F. M. Eden thinks it probable that glass windows were not introduced into farmhouses in England much before the reign of James I. They are mentioned in a lease in 1615, in a parish in Suffolk. In Scotland, however, as late as 1661, the windows of ordinary country houses were not glazed; and only the upper parts of even those in the king's palaces had glass; the lower ones having two wooden shutters, to open at pleasure, and admit the fresh air.* From a passage in Harrison's Description of England, it may be inferred that glass was introduced into country houses in the reign of Henry VIII. He says, 'Of old time' (meaning, probably, the beginning of the century), 'our countrie houses, instead of glasse, did use much lattise, and that made either of wicker or fine rifts of oke in checkerwise. I read also that some of the better sort, in and before the time of the Saxons, did make panels of horne instead of glasse, and fix them in wooden calmes (casements); but as horne in windowes is now (1584) quite laid doune in everie place, so our lattises are also growne into disuse, because glasse is come to be so plentiful, and within verie little so good, cheape, if not better than the other.'

Even, therefore, in respect of the single article of windows, the 'good' old times will not bear comparison with the present. Without glass, it is easy to understand how, in this cold and damp climate, history supplies us with so many deaths occasioned by 'agues'—a disease invariably owing to humidity and cold, but which is now scarcely ever heard of. To impress the reader with the importance of the article, we present a few of the fine euphonious periods of Dr Samuel Johnson. 'Who, when he saw the first sand or ashes by a casual intenseness of heat melted into a metalline form, rugged with excrescences, and clouded with impurities, would have imagined that in this shapeless lump lay concealed so many conveniences of life, as would in time constitute a great part of the happiness of the world? Yet by some such fortuitous liquefaction was mankind taught to procure a body at once in a high degree solid and transparent, which might admit the light of the sun, and exclude the violence of the wind; which might extend the sight of the philosopher to new ranges of existence, and charm him at one time with the unbounded extent of material creation, and at another with the endless subordination of animal life; and, what is yet of more importance, might supply the decays of nature, and succour old age with subsidiary sight. Thus was the first artificer in glass employed, though without his own knowledge or expectation. He was facilitating and prolonging the enjoyment of light, enlarging the avenues of science, and conferring the highest and most lasting pleasures;

he was enabling the student to contemplate nature, and the beauty to behold herself.'*

That an article capable of a greater variety of useful application than perhaps any other in existence, except wood, should be of easy access to the public, is a matter of the highest importance. The duties exacted upon glass are, it seems, from 200 to 300 per cent. on its actual value!† Firstly, makers of glass were obliged to take out a license, which cost £.20 a-year for each glass-house; secondly, such raw materials as are obtained from abroad are subject to a custom's duty; and thirdly, the materials, when in the melting-pot, are assessed at 3d. per pound, or, when taken out of the pot, at 6d. per pound (for the material gains 100 per cent. when shaped), at the discretion of the excise officer. We mention these things to show the disadvantages under which glass is at present produced, and to point out the small encouragement existing for a capitalist to embark in the manufacture. In the latest act of parliament respecting these duties, there are no fewer than thirty-two regulations, prohibitions, and penalties, under which glass can alone be made. An exciseman is frequently on the premises to enforce and exact them; and the glass-maker is cramped and tied by his supervision. This being the case, it is readily to be inferred that the number of glass-works is limited. In 1833 there were only 126 in the whole country—namely, 106 in England, 10 in Ireland, and 10 in Scotland.

Now, however, the whole of these restrictions are to be taken off, and it is impossible to foresee to what useful purposes glass will be put, and how cheaply it will be possible to obtain it. It is not merely a release from the sums paid for excise duties, but relief from the vexatious regulations imposed on its manufacture, which will bring down the price. An elasticity will be given to the trade, and new enterprisers will embark in it. There will be competition, of which at present none may be said to exist, and competition not only as regards price, but in quality, beauty of form, and workmanship. Glass-houses will multiply, and, with them, articles furnished in glass which now are made of less convenient materials.

We need only refer to our article 'On the Influence of Light on Plants and Animals,'‡ to point out the advantages of living in plenty of light; in other words, of having plenty of windows; and although by another description of tax, still exacted, the latter advantage is not to be obtained without expense, yet cheapness of glass is one step towards such a desirable convenience. It is impossible to foresee the advantages of cheap glass which will be reaped by horticulturists. Conservatory frames and other glazed implements of their art are so serious an item of expense, that recent insurance companies have thought it worth their while to afford insurances against hail—a severe storm of which has been known to ruin many a struggling gardener. Private individuals also will be able to have conservatories; and we hope to see the majority of town residences adorned with cases for containing plants. A new impulse will also be given to chemistry. The expense of retorts, tubes, and other glass articles of apparatus, makes a chemist less bold and confident in his experiments than if he did not act under the fear of breakage, and consequently under a dread of incurring inconvenient expenses. We might indeed go to a tedious enumeration of trades and professions by which this important change in our fiscal laws will be benefited. It will be better, however, to mention a few of the novel uses to which glass will be in all probability put.

The coarse 'bottle glass' will make better, clearer, and more durable pipes than the iron ones which are at present used for subterranean conveyance of water to the inhabitants of towns. They will be more durable,

* Several windows of this form are still to be seen in the old parts of Edinburgh, and probably in other towns.—Ed.

* Rambler, No. 9.

† Speech by Sir Robert Peel in the House of Commons.

‡ See p. 38 of the present volume.

because not liable to rust; and more wholesome, because the fluid will not be impregnated with oxide. If they supersede the smaller leaden pipes, there will be no danger of our drinking sugar of lead with our daily meals. Tiles will also, it is expected, be fashioned out of a more transparent glass; and the light denied to more than six windows at the side of a house by the other tax, may be received into the top rooms from the roof. The number of household utensils which will be fashioned out of the coarser qualities of glass, such as green, clouded, and other semi-transparent sorts, are infinitely too numerous to allow of our mentioning more than a few; such as milk-pans, ewers, cups and saucers, and various other kinds of crockery; slabs for tables, side-shelves, &c. which might be made varied by the mixture of several coloured glasses.

Of the finer sorts for ornamental purposes, a great scope for taste and ingenuity will be afforded. Vases, standishes, and many other such articles we shall see in new forms and brilliant colours. Looking-glasses, the best of all ornaments to a room, and useful too for reflecting and retaining light entering from windows, will also be found in more habitations than at present. It is always gratifying to see in the houses of the poor this emblem of self-respect and tidiness. It is, we know, adopted by the poets as the emblem of vanity; but the use of a mirror generally proceeds from a pardonable, respectable vanity.

The removal of duty from glass is universally regarded by those best able to judge as one of the most important fiscal regulations which has been made for many years, chiefly from the influence it will have in increasing the comforts of the poor. The only persons who seem to object to it are the few glass-makers, who, knowing the old excise regulations are an effectual barrier to new speculators entering into competition with them, dread the throwing open of the trade by their removal.

BIOGRAPHIC SKETCHES.

THE REV. SYDNEY SMITH.

THERE are two characters which, when combined in the same individual, seldom obtain the undivided esteem of the public, namely, a wit and a clergyman. Those who admire him as a wit, wish that the dangerous gift existed apart from the sacred office; whilst those who experience edification from the preacher, would, if possible, banish from their minds that he is a wit.

Such is the exact predicament in which the subject of the present memoir was placed during at least fifty years of a long and active life. For him, however, it may be said that no man ever united the two characters with less offence than he. Although a party and controversial writer, he never forgot, while launching the shafts of satire, that he was a Christian, and seldom overstept the bounds of charity, even while dealing with his most bitter opponents. His private life also conformed much better to what is expected from a minister of the gospel, than with what is looked for in a maker of jests.

The parents of Sydney Smith resided at Lydiard, near Taunton, in Somersetshire, though it happened that he was born, in the year 1768, at Woodford in Essex. After having been instructed in the rudiments of education, he was sent to Winchester School, that ancient seat of knowledge, founded by William of Wykeham, at which so many of the most celebrated English scholars have drank their first draughts of knowledge. His progress was so distinguished, that at a very early age, he was elected a scholar of New College, Oxford, of which, at the age of twenty-two, he became a fellow. It was not, however, till he had attained the age of thirty that he took a degree—that of master of arts. Both at school and college he associated with many men who afterwards attained the highest distinction and celebrity—amongst others the present primate of all England. 'I was at school and college,' he says in one of his amusing letters to Archdeacon Singleton, 'with the

archbishop of Canterbury; fifty-three years ago he knocked me down with a chess-board for checkmating him.'

Except his academical acquirements, he had no influence to obtain a living, and was glad to get a curacy of fifty pounds per annum. 'When I first went into the church,' are the first words of the preface to his collected works, 'I had a curacy in the middle of Salisbury Plain.' The parish was Netheravon, near Amesbury. 'The squire of the parish took a fancy to me,' he continues; and after serving for two years, 'the squire'—who was Mr Hicks Beach, M.P. for Cirencester—engaged him as tutor to his son; and it was arranged that Mr Smith and his pupil should proceed to the university of Weimar, in Saxony. They set out; but before reaching their destination, Germany was disturbed by war, and, says the facetious divine, 'in stress of politics we put in to Edinburgh.' Amongst the earliest acquaintances which Mr Smith made in this city were Mr (now Lord) Brougham, and Mr Jeffrey, who now graces the bench of the Scottish judicature; an acquaintance which afterwards led to important results. Meanwhile Sydney, besides attending to his pupil, officiated at the Episcopal chapel in Carrubber's Close during most of the time he remained in Edinburgh, which was five years. One day, towards the end of his residence here, he, Brougham, and Jeffrey 'happened to meet'—we quote his own words—'in the eighth or ninth storey or flat [probably second or third] in Buccleuch Place, the elevated residence of the then Mr Jeffrey. I proposed that we should set up a review; this was acceded to with acclamation. I was appointed editor, and remained long enough in Edinburgh to edit the first number of the Edinburgh Review. The motto I proposed for the Review was—

Tenui musam meditatur avena.

"We cultivate literature upon a little oatmeal."

But this was too near the truth to be admitted, and so we took our present grave motto from *Publius Syrus*, of whom none of us had, I am sure, ever read a single line;* and so began what has since turned out to be a very important and able journal. When I left Edinburgh, it fell into the stronger hands of Lord Jeffrey and Lord Brougham, and reached the highest point of popularity and success.

The first number of the Edinburgh Review was published in October 1802, and to it Sydney Smith contributed four articles, all of them written with a remarkable combination of humour and logic. In the notice of Dr Parr, he reviewed that sententious scholar's wig, of 'boundless convexity of frizz,' along with his sermons, and contrived in the first paragraph a parallel as close as it was startling and ludicrous. His broadest hit was, however, levelled at Dr Langford's 'Anniversary Sermon of the Royal Humane Society.' It consists of the following sentences, which, with an extract, and two lines of comment, make up the entire review:—'An accident, which happened to the gentleman engaged in reviewing this sermon, proves in the most striking manner the importance of this charity for restoring to life persons in whom the vital power is suspended. He was discovered, with Dr Langford's discourse lying open before him, in a state of the most profound sleep, from which he could not by any means be awakened for a great length of time. By attending, however, to the rules prescribed by the Humane Society, flinging in the smoke of tobacco, applying hot flannels, and carefully removing the discourse itself to a great distance, the critic was restored to his disconsolate brothers.'

Though the Review had hardly commenced when Mr Smith left Edinburgh, he continued to support it for many years afterwards. His early contributions gave him a rapid and widely-spread celebrity; and in the year

* *Judex damnatur cum nocens absolvitur*—"The judge is condemned when the criminal is acquitted."

1803 he removed to London, to commence a new career; namely, that of a 'fashionable preacher.' In the metropolis, and a few other large towns, besides the usual and well-known places of worship, there is one class, the internal management of which is, we apprehend, not so generally nor so well understood: these are called 'proprietary chapels'—that is to say, they are the exclusive property of one or more individuals, to whom they are sources of pecuniary profit, in proportion as they are well attended. To obtain large congregations, every allurements is held out. A fine organ is set up, and a skilful organist engaged, together with a professional choir. But of course the chief aim is to procure the services of a popular preacher—such a person as Sydney Smith was likely to be. Accordingly he was, to copy a word from a periodical of that day, 'engaged' to preach at the Berkeley and Fitzroy chapels, and also at the Foundling Hospital. No sooner had he entered on this sphere, than he proved himself a 'star' of the first attraction. His sermons were pointed and elaborate without the appearance of art, natural without any affectation of ease, and spirited without one flagrant breach of ecclesiastical propriety. What he said of Sir James Mackintosh may with truth be applied to his sermons:—'New and sudden relations of ideas flashed across them in reasoning, and produced the same effect as wit, and would have been called wit, if a sense of their utility and importance had not often overpowered the admiration of novelty, and entitled them to the higher name of wisdom.' There was nothing of levity either in his sermons or in his manner of delivering them. His language was argumentative and convincing, and his delivery earnest, though never impassioned; he could convince the reason, though he seldom reached the heart. The chapels in which Mr Smith preached in London were crowded with the wealthy, the dignified, and even with the learned inhabitants of that great city, a circumstance which naturally attracted the attention of those gentlemen who manage the affairs of the Royal Institution, and they solicited his services as a lecturer. The subject he chose was the *belles lettres*; and never was the lecture theatre of the Royal Institution so crowded with 'overflowing audiences' as during the delivery of this course. While enjoying the sweets of fashionable popularity, Mr Smith fell in love. The object of his affection was Miss Fybus, a banker's daughter, whom he married. This important event took place when he had attained the mature age of thirty-five. The result was nothing but happiness until death dissolved the union.

All this while Sydney Smith kept up a running fire of articles in the *Edinburgh Review*, chiefly on church politics. Like Dean Swift, he seldom wrote for mere hire or fame, but only when stirred up by inward principle to advocate some great cause. His uncompromising honesty, therefore, his keen satire, and invulnerable logic, incited as it was by justice and enthusiasm, took tremendous effect; less, however, in advancing his own principles than in damaging those of his adversaries, amongst whom were arrayed the most powerful people in the realm. At that time (the early years of the present century) the expression of public opinion was scarcely free, as it is now. 'It was an awful period,' says Sydney in his preface, 'for those who had the misfortune to entertain liberal opinions, and who were too honest to sell them for the ermine of the judge or the lawn of the prelate: and not only was there no pay, but there were many stripes. It is always considered as a piece of impertinence in England, if a man of less than two or three thousand a-year has any opinions at all upon important subjects.' In 1806, however, the aspect of the political world changed, and the parson's political friends obtained a short ascendancy. One of the first uses they made of it was to present their witty advocate to the living of Frostonin, in Yorkshire, value L.500 per annum.

He was scarcely settled in his living, when his patrons, wishing to remove the disabilities under which our Ca-

tholic fellow-subjects then laboured, were driven from their places by needless alarms of the consequences such a concession would produce. It was then that the celebrated 'Letters of Peter Plymley to his Brother Abraham in the Country, on the Subject of the Catholics,' appeared. Its extraordinary humour and vigorous arguments procured for the pamphlet a prodigious success. The new government 'took great pains,' says Mr Smith, 'to find the author. All they could find was, that they were brought to Mr Budd the publisher by the Earl of Lauderdale. Somehow or other it came to be conjectured that he was the author. * * They had an immense circulation at the time, and I think above 20,000 copies were sold.' The art with which wit and argument are combined in every page of these humorous letters could hardly be surpassed. At the time concession was denied to the Irish Catholics, Napoleon was in the full career of his military successes, and England was in want of soldiers. 'I want,' says Peter Plymley, 'soldiers and sailors for the state; I want to make a greater use than I now can do of a poor country full of men; I want to render the military service popular among the Irish; to check the power of France; to make every possible exertion for the safety of Europe, which in twenty years' time will be nothing but a mass of French slaves: and then you, and ten thousand other such boobies as you, call out—"For God's sake do not think of raising cavalry and infantry in Ireland! . . . They interpret the Epistle to Timothy in a different manner from what we do!" . . . What! when Turk, Jew, heretic, infidel, Catholic, Protestant, are all combined against this country; when men of every religious persuasion, and no religious persuasion; when the population of half the globe is up in arms against us, are we to stand examining our generals and armies as a bishop examines a candidate for holy orders, and to suffer no one to bleed for England who does not agree with you about the 2d of Timothy? You talk about the Catholics! If you and your brotherhood have been able to persuade the country into a continuation of this grossest of all absurdities, you have ten times the power which the Catholic clergy ever had in their best days.'

Mr Smith continued to discharge the duties of a parish clergyman at Frostonin with great credit to himself till the year 1829. In the interval, he laid aside the pen of the political partisan, and occupied himself solely (except, indeed, an occasional contribution to the *Edinburgh Review*) with the care of his flock. He was then presented to the more lucrative living of Combe Flory, in Somersetshire; and in 1831 became canon-residentary of St Paul's cathedral. His habits of life, while ministering the clerical office, were ever those of a respectable, frugal, well-conducted clergyman. 'Till thirty years of age,' he says in one of his letters to Archdeacon Singleton, 'I never received a farthing from the church; then L.50 per annum for two years; then nothing for ten years; then L.500 per annum, increased for two or three years to L.800; till, in my grand climacteric, I was made canon of St Paul's; and before that period I had built a parsonage house, with farm offices for a large farm, which cost me L.4000, and had reclaimed another from ruins at the expense of L.2000.' It may be remarked, that he enjoyed great popularity amongst his flock. His kindly manners, and the practical benefit they derived from his medical assistance—for he had studied medicine at Edinburgh with this express view—conducted, with his spiritual services, to bring about this effect.

While canon-residentary of St Paul's, his keen controversial spirit was roused by certain proposed interferences with the revenues of the English church, and he put forth his opinions on the subject in three letters to an imaginary archdeacon, whom he called 'Singleton.' It was proposed by a commission to take from the higher sinecure incomes, in order to improve the stipends of the humbler clergy; a measure patronised by several members of the Episcopal bench, and which we, in our ignorance, would suppose to have been a rational and

laudable one; but not so thought our wit. It was his opinion that 'large prizes,' in the form of a few goodly incomes, were calculated to do more good than a monotony of moderate stipends. Adverting, in a commentary on one of the ecclesiastical commissioners' reports, to the general question, he says, 'A picture is drawn of a clergyman with £130 per annum, who combines all moral, physical, and intellectual advantages—a learned man, dedicating himself intensely to the care of his parish, of charming manners and dignified deportment, six feet two inches high, beautifully proportioned, with a magnificent countenance, expressive of all the cardinal virtues and the ten commandments; and it is asked with an air of triumph if such a man as this will fall into contempt on account of his poverty? But substitute for him an average, ordinary, uninteresting minister—obese, dumpy—neither ill-natured nor good-natured—neither learned nor ignorant—striding over the stiles to church, with a second-rate wife, dusty and deliquescent, and four parochial children, full of catechism and bread and butter: or let him be seen in one of those Shem-Ham-and-Japhet buggies—made on Mount Ararat soon after the subsidence of the waters—driving in the High Street of Edmonton among all his pecuniary, saponaceous, oleaginous parishioners. Can any man of common sense say that all these outward circumstances of the ministers of religion have no bearing on religion itself? A picture which he draws of the commissioners in the character of paymasters of these small stipends is broadly humorous:—"There is some safety in dignity. A church is in danger when it is degraded. It costs mankind much less to destroy it when an institution is associated with mean, and not with elevated ideas. I should like to see the subject in the hands of H. B. I would entitle the print—"The Bishops' Saturday Night; or Lord ——— at the Pay-table." The bishops should be standing before the pay-table, and receiving their weekly allowance; Lord ——— and ——— counting, ringing, and biting the sovereigns, and the bishop of E—— insisting that the chancellor of the exchequer has given him one which was not weight. Viscount ———, in high chuckle, should be standing with his hat on and his back to the fire, delighted with the contest; and the deans and canons should be in the background, waiting till their turn came, and the bishops were paid; and among them a canon, of large composition, urging them on not to give way too much to the bench. Perhaps I should add the president of the Board of Trade, recommending the truck principle to the bishops, and offering to pay them in hassecks, cassocks, aprons, shovel-hats, sermon-cases, and such-like ecclesiastical gear.'

The latest of Mr Smith's literary productions concerned the non-payment of the interest of the Pennsylvanian loan, by which it is understood that he was himself a heavy sufferer. He first petitioned the American legislature on the injustice of the defalcation; and then, when he found that produced no effect, wrote a letter to a London newspaper in his usual irresistible style. 'I never,' he declares, 'meet a Pennsylvanian at a London dinner without feeling a disposition to seize and divide him—to allot his beaver to one sufferer and his coat to another—to appropriate his pocket-handkerchief to the orphan, and to comfort the widow with his silver watch, Broadway rings, and the London Guide, which he always carries in his pocket. How such a man can set himself down at an English table, without feeling that he owes two or three pounds to every man in company, I am at a loss to conceive; he has no more right to eat with honest men than a leper has to eat with clean men. If he has a particle of honour in his composition, he should shut himself up, and say, "I cannot mingle with you; I belong to a degraded people; I must hide myself—I am a planderer from Pennsylvania." Figure to yourself a Pennsylvanian receiving foreigners in his own country, walking over the public works with them, and showing them Larcenous Lake, Swindling Swamp,

Crafty Canal, and Rogues' Railway, and other dishonest works. "This swamp we gained (says the patriotic borrower) for the repudiated loan of 1828; our canal robbery was in 1830; we pocketed your good people's money for the railroad only last year." All this may seem very smart to the Americans; but if I had the misfortune to be born among such a people, the land of my fathers should not retain me a single moment after the act of repudiation.'

During his residence in London, Sydney Smith was the delight of the society in which he mingled, till almost the end of his days. He was, to use a phrase of his own, a diner-out of the first lustre. The good things which he dropped in the course of conversation were, unlike Sheridan's, unpremeditated. He never hoarded or polished jokes, that they might be brought forward in their highest state of finish before an audience sufficiently large or sufficiently brilliant to yield him satisfactory applause. They came from the fullness of his lively and cheerful nature, as much to amuse himself as others. He used to say that he had reason to thank Heaven for bestowing upon him a mind which was to himself an exhaustless fund of amusement. Yet he had occasionally his melancholy days, like all intensely nervous men, and now and then he became so abstracted as to appear grave. Even then, droll ideas would arise and be delivered, and he would join in the hearty laugh they were sure to occasion. Many of his happy expressions and phrases have entered into the current intellectual language of our time; as his celebrated definition of orthodoxy and heterodoxy, his speaking of a gentleman with 'a very landed manner,' and his wishing for 'a forty-parson power of conversation.' His wit in favour of the Catholics undoubtedly had political importance, and the Reform Bill was sensibly helped forward by his comparison of the opposition to Mrs Partington vainly trying to mop out the Atlantic. Of his many table witticisms and humours, hundreds will be remembered in London society beyond the present generation; as, for example, his answering that he had not read such a book—he would wait a month, in hopes it would blow over; or his telling his brethren of the chapter, when they were debating about wooden pavement for St Paul's churchyard, that they had only to lay their heads together, and the thing was done. There was a logic and a soundness of sense in almost all his witticisms, that gave them one half their effect. At the same time there was no spice of ill-nature in any of them. Annoyed one evening at a young gentleman, who, though a new acquaintance, was encouraged by his jocular reputation to address him by his surname alone, and hearing him tell that he had to go that evening to the house of the Archbishop of Canterbury for the first time, he pathetically said, 'Don't call him Howley.' Some one remarking that the marriage of a young relation of his had been introduced in rather flaming terms into the Morning Post, he said, 'Very absurd indeed—mistaking us for fashionable people—why, we pay our bills.' It would be stupid to give a mere series of his good things, and we shall not attempt it. After all, his estimate with posterity will rest on higher grounds. In the words of a contemporary writer—"In everything which he attempted he appears to have been eminently successful. At college he graduated with honour, and obtained a fellowship. He projected and contributed to a review which has enjoyed the highest degree of prosperity; he attempted an ambitious style of preaching, with a vigour of talent which distanced all rivalry; he became a public lecturer, and the whole world of Mayfair flocked to Albemarle Street to enjoy his humour, and become enlightened by his researches; he published political works, which have gone through editions so numerous, that as many as 20,000 copies of some have been sold; he lived long enough to enjoy his reputation, and to attain to a greater age than falls to the lot of ordinary mortals; and yet those who appreciate wit, who can admire learning, and who honour the man that

used both for the good of his species, will be disposed to think that, old as Sydney Smith was, he died too soon.' The melancholy event took place on the 22d of February last, at his residence in Green Street, Grosvenor Square.

LOITERINGS IN FRANCE—1844.

NISMES—PONT DU GARD—RETURN HOME.

We arrived in Nismes from Beaucaire in an open railway train, and involved in one of those remarkably gusty winds which haunt this southern region of France. Lying at the extremity of the hilly range which extends from the centre of France to this quarter, Nismes occupies a pleasant situation, sheltered from the north, and with a sunny exposure towards the flat tract of country bordering on the Mediterranean. Anciently an important seat of the Roman power in Gaul, we find it in modern times a populous and more than usually neat French provincial town, abounding in objects which attract the curiosity of travellers interested in ancient history or art. To see some of these was the sole object of our visit.

After settling ourselves at a hotel, we strolled along a handsome street, resembling the Boulevards of Paris, the thoroughfare being lined with trees, and the resort of a well-dressed lounging population. At the western extremity of this fine street stands the principal object of antiquity in Nismes—a Roman amphitheatre, gray, massive, and in a wonderfully good state of preservation. Fresh from viewing the amphitheatre at Arles, the novelty of such a sight was worn off; but in this there was something likewise to interest us. Although somewhat smaller than that at Arles, it is fully more striking at first sight, from standing in the midst of an open Place, and on perfectly level ground. Walking freely all round it, we are able to form an estimate of every external feature, and deliberate on its probable appearance some two thousand years ago, when it formed the place of amusement of a barbarous populace.

Abused and damaged in various ways during the middle ages, and subsequently neglected, this massive structure has in recent times been carefully restored where most injured, at the expense of the French government. The architecture, resembling that of the amphitheatre at Arles, has in numerous places been repaired, whole arches and pilasters, with commendable taste, being built in the original style. By these means, and with occasional mendings, the structure will in all probability survive much in its present condition till the fortieth or fiftieth century, if not till a far longer stretch into futurity. Surely the preservation of such interesting memorials of a past state of things is one of the most praiseworthy acts of an enlightened administration.

By an entrance on the west we gained access to the interior, which we found to consist of a cleared arena, oval in form, and environed by flights of stone benches to the top of the bounding wall. Some portions of the seats are entirely gone, showing the broken arches on which they had rested, and this gives a generally ragged and spectral appearance to the scene. We were able, however, to clamber up the ascent, from bench to bench, and gaining the summit, to look down on the now deserted and silent arena, which had once resounded to the yells of wild beasts and their miserable victims. On the top of the bounding wall are the holes, formed in projecting stones, which had received the poles that supported the velaria or awnings, drawn across to shelter the spectators from the sun. According to the best measurement, the amphitheatre is an oval of 437 feet in length by 332 in breadth, and, with 30 or 32 rows of seats, it could accommodate about 20,000 spectators. This was doubtless, as at Arles, a greater number than the whole population of the town; but provision was made for hosts of soldiery, and also for the people of the country around.

Besides *Les Arènes*, as the amphitheatre is now called,

the town possesses a singularly beautiful Roman structure, termed the *Maison Carrée* (square house). This is situated nearly opposite the modern theatre, in a boulevard going northward from *Les Arènes*, and consists of a temple of Corinthian architecture of elegant proportions. Twenty pillars are connected with the sides of the structure, and ten are detached in front, forming the portico, to which there is a flight of steps giving access to the interior. For ages in a neglected condition, and damaged in some places by vulgar violence, it has been latterly restored, and put into the best possible state. Lighted from the roof, it forms a gallery of pictures open to the public. Our visit being on a holiday, we found it crowded with townfolk of all classes. By the archaeologist of taste, this building will be viewed with much pleasurable emotion. It is, I believe, the most perfect ancient edifice in the pure Grecian now in existence, and on account of it alone, Nismes is well worthy of a visit.

At the distance of about half a mile in a westerly direction, and on the outskirts of the town, we found other objects attractive from their antiquity. Pursuing our way along the banks of a canal, under the cool shade of a line of lofty trees, we are led to the source of this water-course in a public garden sloping from the base of a steep hill. In this spot nature has sent forth a powerful spring, which the Romans had embellished with architecture, and laid out as baths on an extensive scale. The buildings, renovated in comparatively modern times, still remain, with the water flowing through them towards the canal in the lower grounds. Adjoining the baths, and situated within the enclosure of a paltry cabaret, are shown the remains of a temple of elegant architecture, in the best Grecian taste. It is apparent, from these and other relics, that the garden was anciently a scene of more than usual splendour. Not satisfied with the amount of water delivered by the fountain, the Roman builders of the city had augmented it by a supply brought by an aqueduct from a distance of many miles—an effort at supplying a population with one of the prime necessities of life, which no one can justly estimate who has not visited this very interesting spot.

The termination of this stupendous work of art had been at, or near, the fountain in the garden; the water, according to all accounts, being conducted down the declivity of the hill behind, so as to form a cataract at the base, in the midst of a rural scene, in which handsome edifices, clusters of leafy trees, and the glitter of falling water, all conspired to form an enchanting piece of suburban scenery. In the present day, no appearances of the aqueduct or its outlet are visible on the face or sides of the hill, which is laid out as a shrubbery, with public promenades; and by one of these winding and ascending pathways we proceeded to the summit, a height of perhaps five hundred feet. Having gained the top of the ascent, we were rewarded by a magnificent prospect of the town beneath and its environs; but to gain a still better view, we climbed the summit of a lofty tower which crowns the rocky shoulder of the hill. This tower is a curiosity and a puzzle to everybody. Its antiquity baffles research. Its style is nondescript, and its uses unintelligible. It is a clumsy mass of masonry, tapering to the top, not unlike a glass-house. The walls are several feet thick; and it does not appear to have had originally any windows. The most feasible conjecture is, that *La Tourmagne*, as it is called, was a mausoleum of some great personage. That it was of a date prior to the intrusion of the Romans into Gaul, seems certain; for they incorporated it with the walls of Nismes, and made it serve the purpose of a watch-tower. In England, such a curious old structure would of course have been left to go to decay; but it is the policy of the French government, as I have already said, to afford a trifle towards the preservation of works of art, and *La Tourmagne* has accordingly not been forgotten. Not many years ago it was carefully repaired; and, admitted by a door, we find that a spiral

stone stair has been raised from the centre of the floor to the top of the bell-shaped roof. On ascending, we were landed on a bartisan at the apex of the tower; and here the prospect embraced a vast range of country, from the hills of Provence to the borders of Spain. Looking southwards, we had on our left the Rhone and Arles; in front was a large flat plain, dotted over with olive trees, to the shore of the Mediterranean, whose waters could be dimly recognised through the mists which glimmered in the heated atmosphere; towards the right, the country rose into a hilly tract, over the top of which, like a pyramid piercing the sky, was seen the Pic du Midi, one of the loftiest of the Pyrenees.

In catching a glimpse of this far-distant region, our satisfaction was damped by the consideration that we must, at least for the meanwhile, postpone paying it a visit. It had been our design to proceed from Nismes by Toulouse to Pau and the Pyrenees; but symptoms of an alarming complaint, brought on by the excessive heats, admonished me not to attempt such a journey, and with the best philosophy we could assume, we resolved on turning our faces homewards. After a short stay in Nismes, therefore, we proceeded in the direction of Avignon, in order to reach Lyons by the Rhone, the easiest channel of conveyance. In performing this short journey across the country, it was gratifying to have an opportunity of loitering an hour or two over one more object of interest—the aqueduct which had supplied the fountain of Nismes with water in the days of its Roman greatness.

The distance from Nismes to Avignon is about twenty miles, the road stretching across a hilly piece of country, bare, and not very interesting. About half way we arrive at a valley which, by contrast with the brown uplands, may be called pretty, and through it is seen meandering a refreshing little river, the Gardon. Turning by the road up the right bank of the stream, it was with a degree of breathless anxiety that we watched every turn in the banks, to catch a sight of the Pont du Gard, such being the modern name of the object we were in quest of.

'There it is at last,' we exclaimed. 'How grand!—how stupendous! Stop, let us dismount; we must have a thorough inspection of this wonderful work of art.'

We accordingly dismounted from our vehicle, and approaching at an open part of the valley, had the best opportunity of seeing the Pont du Gard, clear and relieved from the connecting banks, with a back ground of open blue sky. The spectacle presented was that of a bridge composed of three ranges of arches, one above another, and extending across a valley of upwards of 800 feet in breadth. As the caleche moved on, and left us to ponder in silence on the object before us, we felt that we were looking on one of the grandest memorials of Roman greatness. In the silence and seclusion of a picturesque scene, did this vast piece of masonry stand proudly before us, and nearly in the same state of preservation as it had been left by the workmen two thousand years ago. Yet it is only a fragment of a line of aqueduct which extended twenty-five miles in length; here spanning a valley, there creeping along a hill-side, or crossing a heathy upland, but always keeping on one level, or slightly inclining from the source to the point of outlet.

We took a long look of the mass at this distance, so as to fix its appearance well in the memory, and then advanced to view it more closely. The arches are as entire as if built yesterday, although constructed of not a particularly hard sandstone. The three ranges of arches differ in size and number. The lowest row, resting partly in the river, are six in number, and of a fine semicircular span; the second or central row consists of eleven arches, and are nearly half the size of those beneath; in the uppermost row are as many as thirty-five, and these are of very diminished proportions. A few of the uppermost which had rested on the north bank are broken away, leaving this extremity in ruin, and unapproachable. About a century ago, the

states of Languedoc placed a row of arches alongside the lower range, to form a bridge to carry the road across the valley, and this in some degree impairs the antique character of the aqueduct. It is justice, however, to say that this addition is made in strict keeping with the older parts, and cannot be detected till on a near approach. While our vehicle turned slowly on its way by this modern bridge, we remained on the right or southern bank of the stream, determined to gain a sight of the top of the structure where it is alone accessible. This we were able to do by means of a zig-zag footpath recently cut in the shrubby bank. Having got to the point where the upper row of arches reaches the hill, we found this portion of the building as solid and entire as that beneath. The duct for conveying the water consists of a channel now open to intrusion, but covered with flag-stones through its whole length, except where a fragment of stone has been here and there dislodged; and by the crevices so formed, the beams of the sun penetrate and light up the passage. I must here observe, what no one else has thought fit to notice, that the duct is not straight, neither is it of equal dimensions throughout, and consequently the opening on the north can scarcely be seen from the southern entrance. My own impression is, with respect to the present and other relics of Roman art which I have described, that either the architects did not study to be very exact in their plans, or the masons were allowed to go on by a species of guess-work in their operations. Perhaps the great length of time occupied in these enormous works of art, and the defectiveness of means, caused a laxity in their execution, it being deemed quite sufficient if the structures were completed any way. From whatever cause, the Pont du Gard is far from uniform in point of detail. Several arches in the same row vary in size, and the duct on the top, following the general and apparently needless bend, is by no means straight. The total length of the upper row of arches is 873 feet, and the height of the top from the river 188 feet. The breadth of the structure diminishes as it rises. Underneath, the piers of the arches measure about eighteen feet; the middle arcade is narrower; and at top the breadth is not more than five or six feet.

The pathway by which we ascended the bank leading us direct to the mouth of the duct, we did not scruple to enter to investigate its character. The shape was that of a conduit, about four feet and a half high, and varying from twenty to twenty-four inches wide. The roof was of flat stones; but the sides and bottom were lined with a firm dark-coloured cement, and water-tight. The space being sufficient for our walking through it in a stooping posture, we proceeded to its further extremity, where we observed that preparations were making for building a stone stair to connect it with the adjacent bank. At this end, however, we had an opportunity of seeing it, after we had descended, crossed the bridge, and mounted the left bank of the river; and here also we traced the clusters of low broken arches for some distance through the vineyards which partially covered the higher grounds. In pursuing this search, the sun glared with the heat of a furnace, and rendered the walk scarcely endurable; but the novelty of the scene, and the quantity of sweet-scented herbs which perfumed the atmosphere, tempted us onward. We could observe fragmentary masses, varying in height from ten to fifty feet, extended in an irregular course over a wide tract of country; the whole duct, in its original state, having gathered and brought along the water of two rivulets, the Airan and Ure, situated at a distance of twenty-five miles from Nismes.

In taking a final glance at the Pont du Gard, the most imposing fragment of this ancient aqueduct, we did not feel less impressed with its grandeur than when it first burst into view. It was evident that the Romans, who constructed it, must have been animated with the strongest disposition to supply their cities with pure water on the largest scale consistent with their means. Yet, after all—and is there not an 'after all' in every-

thing?—when one reflects on the comparatively small results achieved by this stupendous mass of masonry, how much are we struck with the great waste of labour! The compass of the stream of water desired to be carried such a distance from its fountain, was not greater than could be contained in an iron tube of two feet in diameter; and if a tube of this dimension had been employed, following in its course all the sinuities of the ground, how moderate would have been the scale of engineering—how comparatively insignificant would have been the expenditure of time, money, and other requisites! It is highly probable that the severest part of the labour in constructing the aqueduct was performed by slaves—captives taken in battle—many of whom perished under the oppressions to which they were exposed; and, what is almost a matter of certainty, the money expended on the works would be tribute extorted from conquered nations. And yet, though erected by the plunder of the world, how inferior in point of magnitude is this great work; how little did the Romans actually do, in comparison with what is now effected by the voluntary union of honestly-accumulated capital—railways hundreds of miles in length, bridges and viaducts of much grander proportions than the Pont du Gard in all its glory!

These random gossipings on what fell under our notice in the course of a tour in France in 1844 are now, to the relief of the reader, concluded. In a few days after our visit to Nîmes, we had ascended the Rhone, proceeded from Lyons to Paris, and landed in our own dear country, glad once more to breathe the exhilarating air of the north, after our sufferings under the heats of a southern summer.

STUDIES ON THE SEA-SHORE.

ADDRESSED TO YOUNG PERSONS.

THERE are few young people who have been brought up in an inland district, to whom their first visit to the ocean does not form a remarkable era in their juvenile life. The scene is so perfectly new, everything is so strange, the shores abound with so many glittering pleasures, while the prospect of the vast expanse does at the same time inspire a kind of solemn awe, that the youthful mind is filled and impressed with recollections that never afterwards fade. A long-promised visit to the sea-coast was at last accomplished, and a beautiful autumn evening found us for the second time wandering on the smooth white sands of the shore. The receding tide had left dry the far-sloping beach; the sea was still and placid, with now and then a slight ripple glittering in the sun; a few boats and distant ships glided with their white sails on the deep, nearly as like things of life as the agile sea-birds that dipped and sported in the shallow water. The hearts of the young people bounded with an exquisite and new joy; and after skipping about for some time in many circles over the sands, they returned to me to give words to their novel delight.

'How lovely is everything to-night!' said Elizabeth. 'I have now got familiar with the great ocean. I confess my mind yesterday was filled with a strange dread; those noisy and foaming breakers seemed so angry like; the waves came one after the other, rolling up to us like so many coiling serpents; and my heart shuddered as I looked far, far onward, and saw nothing but one dim expanse of green water; but now the waves, instead of menacing us, have retired far out. All is lulled and quiet, and such a beautiful beach is left us, that I shall never tire wandering over it, and exploring its curious productions.'

'We have been fortunate, my dears, in this our first and short visit, to witness the ocean in its two extreme phases. Yesterday was indeed a storm; less, however, in its violence in this locality than it must have been seaward; for the swelling waves and high surf ex-

tending in that vast circular line which you witnessed with such astonishment, indicated that a high wind at a distance had raised the commotion.'

'I had many strange dreams last night,' said Henry, 'about vessels foundering, and the cries of sailors clinging to the broken masts, or dashed among the rocks, and dying without any to help them. Nor shall I forget the appearance of last night's sun, as it set redly amid dark purple-looking clouds, which came in huge masses careering with the wind, while the frothy spray dashed up among the hollow rocks. Beautiful as the scene before us now is, I almost regret that it is so changed. I hope we shall have another storm before we go; for I delight to watch the turmoil of the waters, the screaming of the sea-birds, and the roar of the surf against the rocks. What, after all, is our lake, and hills, and green fields at home, compared to this magnificent scene? I long to launch upon those waters, and explore them to their uttermost boundaries.'

'So Henry is become a sailor at once, cries Mary; but he shall never speak ill of our loved home; and instead of sailing over the seas, let us go and collect beautiful shells and pebbles to carry home with us.'

'Mary is right,' we exclaimed; 'instead of speculating about untried enjoyments, let us improve those which the present time presents. The storm of yesterday has been at work for our gratification; the beach is strewn with the treasures of the deep; marine plants have been torn up and drifted along the shore; shells and marine animals have been scooped from their caves and hiding-places; and all are now exposed to view, and await our inspection. You see those piles of sea-wrack?—that is the vegetation of the deep; and though differing greatly in form and appearance from land plants, yet they are not without their importance, nor are they without their admirers.'

'Do trees, then, grow in the sea?' inquired Mary.

'Not exactly trees,' I replied, 'but a kind of simple plants called *fuci*, having stems and broad leaves of a soft leathery structure, nearly resembling the lichens which I have shown you on our rocks, and bearing seeds of a very simple kind like them. You see they are of all sizes, from this small delicate-tufted plant to those large-leaved tangles of many feet in length. Indeed many parts of the ocean, to the depth of several hundred feet, are clothed with a vegetation as luxuriant as that on land, the tangled stems and leaves of which form the abiding places of myriads of fishes and marine animals of various kinds. We shall now pause at this spot, and examine a few of the plants. That long cord-like specimen which Henry draws out to the length of ten or twelve feet, is very common in the northern seas: in Orkney it is called sea-catgut, with us sea-lace. It grows in large patches, just like long grass in a meadow, attaining a length of from 20 to 30 feet. This other plant, with the tall round stem, terminated by a broad and long leaf, is a very common one, called the *laminaria*, or sea-tangle, of which there are several species, those of warm seas growing to the height of 25 feet, with a stem as thick as that of a small-sized tree. The gigantic *fucus* of South America attains a height much greater than this, but with a diameter of stem not more than an inch. Captain Cook describes these *fuci* as attaining the astonishing length of 360 feet. They flourish in immense groves throughout the southern ocean, and are all alive with innumerable animals, that take shelter among and derive their sustenance from them.'

'The sea, then,' said Henry, 'can boast of taller vegetables than the land; for, if I recollect rightly, the tallest palms do not exceed 150 feet, and the *araucaria* of New Holland is not above 60 feet more.'

'You are quite correct, Henry; and I may mention another sea-plant, which is said to reach 500 to 1500 feet in length. It is a slender weed, called *macrocystis*. The leaves are long and narrow, and at the base of each is placed a vesicle, which is filled with air, and which serves to buoy up and float the plant near the surface

of the water, otherwise, from its weight, it would sink to the bottom.'

'And what is the use of all these plants?' inquired Elizabeth.

'Like land vegetation, they fulfil the important office of affording food and shelter for the myriads of animals with which the sea, like the land, is peopled. They are also not without their uses to man. These heaps of drifted weed form the best of manures for the soil. In some countries sea-weed is collected and burnt, and the ash, which is called *help*, produces soda. Several kinds are also capable of being boiled down into a sort of glue; and here is the little rock-weed, which is erroneously termed Irish moss, but which is in fact a sea-plant (*chondrus crispus*). This plant, when well washed, so as to free it of its salt, and then slowly boiled in water, forms a light and nutritious jelly, of which I think you have often partaken when made up with milk and sugar.

'But look here,' said I, pointing to a small object lying under the heap of wrack which we had just been examining; 'what do you take that to be?' They all pronounced it to be a small marine plant just like many of the others strewn around. 'Now, scrutinise it particularly,' said I. Henry took it up with his hand, and laid it on a piece of paper prepared to receive some other plants. To their surprise the object made several movements: it again moved, and again was still: they watched it with some eagerness, and not without some dread. At last I picked off two or three of the branches of the apparent plant; a claw of an animal now was visible: I continued to pick off more; a head of a crab-like creature was displayed; and finally, clearing off the whole, a small but complete and living creature of the crustacean family was exhibited to their wondering gaze. A flood of questions now assailed me. 'This little crab (*macropodia phalangium*) is an inhabitant of our sea-shores, and is remarkable for its instinctive propensity of adopting the disguise of a vegetable. It, in short, lives a continued life of masquerade. For this purpose it selects the branches of a small fungus just about its own size, and sticks them so artfully over its limbs and body, that the whole is masked, so as to represent exactly the plant which it has selected. Whether the pieces of plant adhere by their own glutinous juices, or whether the animal spreads over its body a juice peculiar to itself, I cannot tell, but certain it is the animal is found always thus dressed; and it would appear to change its coat whenever it becomes old, for the leaves are always fresh and unshrivelled. The reason of this disguise is evidently concealment—either to conceal itself from its own foes, or to enable it the better to pursue its prey, or perhaps for both these purposes. At all events, the instinct is a very singular one. There is another crustacean, and a better known one than the other—the hermit crab. This fellow likes a good comfortable house, but he will not build one for himself, so he looks about for the first empty shell that will fit him, and in he walks back foremost. You see how he looks out at his door, and now how he scampers off with his house upon his back. To convince you that the creature takes up its abode in a chance shell, here are several more of them, and all the shells you see are of different forms. As the young animal increases in bulk, it leaves its first small shell and takes to a larger. You see this well exemplified in the various sizes of the animals before us.'

Mary had now got hold of a large shell, the waved baccinum, and had applied it to her ear, listening to the hollow sound which it thus emitted. She had been prompted to this from having practised the same thing with shells at home, and I now asked Henry if he recollected Landor's verses in allusion to this circumstance. He promptly called to mind those shells

Shake one, and it awakens—then apply
Its polished lips to your attentive ear,
And it remembers its angust abodes,
And murmurs as the ocean murmurs there.'

'Sure enough it murmurs,' cries Mary; 'but if we carry it away with us, will it still preserve this mysterious union with the ocean?'

'It will still continue to sound when applied to your ear wherever you carry it; but so will any other hollow thing—a tin box, a cup, an empty tumbler, or any such—and yet I am sorry thus to dissipate with plain matter of fact the beautiful fancy of the poet.'

'What is the real matter of fact, then?' inquired Henry.

'It is simply that the concave sides of the shell reverberate the current of warm air which is always passing off and upwards from the surface of our bodies, its place being as constantly taken by a fresh supply from the surrounding atmosphere. The hollow murmuring is the slight sound produced by the air-current striking against the sides of the shell, and being echoed, as it were, from every point, and returned again to the ear.'

'I am almost vexed you have explained this to me,' said Mary; 'for at home I have often pleased myself with the thoughts that the shell roared or murmured when the tides of its parent ocean flowed in, and that it was silent until the time of the flowing tide returned. So bewitching is fancy! And yet, after all, I believe I shall be more satisfied with truth. I shall carry this shell home with me, however; and when I wish to recall the dashing of the sea-waves and the roar of the surf along the sands, and up among the rocks, I will have only to apply this talisman to my ear. In this respect it will be to me still the shell of the poet.'

As we continued our walk, several little tracks in the sand attracted our attention. Henry determined to follow up one of them, in order to ascertain their cause: he continued to trace one for more than ten yards, and at last stopped almost at the brink of the water. We hastened to the spot, and perceived that the trail was made by the common cockle. It was curious to mark the creature pushing out its single foot from between its two-valved shell, and pressing it against the soft sand, thus pushing itself onward step by step. It had thus travelled at least ten to fifteen yards in the few hours since it had been left on the beach at high water, and now it seemed to be returning to the sea to feed. A little onwards we came to two other well-known edible shell animals, the oyster and mussel. Unlike the cockle, both these were stationary animals. They were securely anchored to stones, and we spent some time in examining the fine silken fibres (the *bysus*) which proceeded from their bodies, and were fixed by the other end to the rocks, thus forming a secure cable.

The frequent lash of the returning tide, and the rapidly descending sun, now warned us that it was time to return home. We did so reluctantly, and paused for a moment to take a look at the descending luminary. How different was the sunset from last evening. The sky was one sea of soft mellow light, curtained above by stripes of filmy clouds of the brightest hues. The sun was just dipping its orb into the deep, and sent a long line of flickering rays athwart the glassy mirror, even reaching to our feet. Sea-birds were speeding along on swift wing to the shores; one or two little boats were seen gliding homewards; but the distant ships steadily held on their way, now almost lost in the misty distance—night and day pursuing their course over the vast deep. As we ascended the sloping beach, we were recalled from our visions of the sea by objects reminding us of the land. The cattle from the neighbouring fields had wandered down to the beach, and their dark massive forms were seen between us and the sky, as they straggled along the shore. 'I think these cattle are actually feeding on the sea-weed,' cried Henry; 'I am sure I see one cow busily chewing a piece of sea-tangle.'

'That is the very object,' I replied, which has made

'Of pearly hue
Within, for they that lustre have imbibed
In the sun's palace porch, where, when unyoked,
His chariot-wheel stands midway in the wave.'

them wander here. Why should not cows and oxen love the sea-side as well as we? All graminivorous animals are exceedingly fond of salt, and of every substance which contains it. Hence they chew with avidity the sea-weed and lick the salt incrusts on the rocks. Nay, they will also feed with avidity on fish.

"At the western extremity of the island of Lismore, on the Argyllshire coast," says Dr Macculloch, "are some rocks separated at low water, where the cattle may be daily observed resorting, quitting the fertile pastures to feed on the sea-weed. It has erroneously been supposed that this practice, as well as the eating of fish, was the result of hunger. It appears, on the contrary, to be the effects of choice, in cattle as well as in sheep, that have once found access to this diet. The accuracy with which they attend to the diurnal variations of the tide is very remarkable, calculating the times of the ebb with such nicety, that they are seldom mistaken even when they have some miles to walk to the beach. In the same way, they always secure their retreat from these chosen spots in such a manner as never to be surprised and drowned by the returning tide. With respect to fish, it is equally certain that they often prefer it to their best pastures. It is not less remarkable that the horses of Shetland eat dried fish from choice, and that the dogs brought up on these shores continue to prefer it to all other diet, even after a long abstinence."

'Herodotus mentions that the inhabitants in the vicinity of the lake Prasias were in the practice of feeding their horses and cattle on fish. The Icelanders and Faroese do the same, both with fish and dried whales' flesh, which they generally serve up as a soup, with a small quantity of fodder. "In the northern parts of the state of Michigan," says Captain Marryat in his Diary in America, "hay is very scarce, and in winter the inhabitants are obliged to feed their cattle on fish. You will see," says he, "the horses and cows dispute for the offal; and our landlord told me that he has often witnessed a particular horse wait very quietly while they were landing the fish from the canoes, watch his opportunity, dart in, steal one, and run away with it in his mouth."

'This surprises me,' said Elizabeth, 'I thought animals, if left to their own choice, would always confine their tastes to the particular kind of food to which they were destined by their structure.'

'As a general rule, this holds true; few carnivorous animals, I believe, would be disposed to exchange their beef for greens; but then, again, those who live on greens seem to have a hankering now and then after a piece of beef. I daresay you may have observed at home how pertinaciously a cow will keep chewing at a bone a whole day, to the utter neglect of her grass, and to the no small dismay of the dairy-maid in the evening, when the cow returns without a drop of milk.'

'I have observed it frequently,' cried Henry, 'and I have been taught to creep close to said cows when so employed, and throw into their mouth a handful of sand and small pebbles; this, by mixing with their favourite morsel, spoils the whole, and they then reluctantly throw the mouthful out and take to their grass.'

Darker and darker now grew the evening shadows as we slowly took our way landwards. The waving sand-hills at last shut out all view of the ocean, and its hollow murmurs only reached our ears. We bade it a last adieu, after having spent two delightful days admiring its wonders, and having brought away with us numerous trophies, to remind us of our studies on the sea-shore.

ELECTRIC CLOCKS.

The following extract, from a letter from Mr Finlaison of Loughton Hall, appears in a recent number of the Polytechnic Review:—"Mr Bain has succeeded to admiration in working electric clocks by the currents of the earth. On the 28th of August 1844 he set up a small clock in my drawing-room, the pendulum of which is in the hall, and

both instruments in a voltaic circle as follows:—On the north-east side of my house two zinc plates, a foot square, are sunk in a hole, and suspended by a wire, which is passed through the house to the pendulum first, and then to the clock. On the south side of the house, at a distance of about forty yards, a hole was dug four feet deep, and two sacks of common coke buried in it; among the coke another wire was secured, and passed in at the drawing-room window, and joined to the former wire at the clock. The ball of the pendulum weighs nine pounds; but it was moved energetically, and has ever since continued to do so with the self-same energy. The time is to perfection; and the cost of the motive powers was only seven shillings and sixpence. There are but three little wheels in the clock, and neither weights nor spring; so there is nothing to be wound up.

RESPECT FOR GENIUS.

Genius, strictly speaking, is only entitled to respect when it promotes the peace, and improves the happiness and comfort of mankind. What should we think of the gardener who planted his flower-bed with henbane and deadly nightshade? What should we think of the general who, being intrusted with an army, and a plentiful supply of military stores, applied these powers to degrading and enslaving his own country? He should be visited with scorn, and punished as a traitor. And why should the man who directs the artillery of his genius, delegated to him for high and holy purposes, to shaking those foundations on which the happiness of his species rests, and who applies the divine spark within him to the kindling of low and debasing passions, be allowed to hear his plaudits swelled in proportion as his powers of doing mischief become apparent? Talent is always accompanied with the responsibility of using it rightly; and the neglect or pity of the virtuous is the penalty which the child of genius pays, or ought to pay, for its abuse. However splendid talents may compel our admiration, they have no right to claim the general esteem of mankind when their possessor exercises them without regard of what is due to the wellbeing of society and himself.—*Literary Gazette.*

A SONG FOR MARCH.

[FROM THE GERMAN OF GANDERSEN VON SALIS.]

SEE the tender grass up-springing,
Where the snow and ice have been;
Rosy buds from lime-twigs swinging,
Sport the sprouting leaves between;
While the breath of renovation,
Through the air fresh seedlets winging,
Wafts new life o'er all the scene.

All adown the meadow rivers,
The veiled violet of the field
'Noath its tender foliage quivers,
Bursting through its leafy shield,
To meet the primrose paley-gold;
While the naked crocus shivers,
Though a sand-bank shelter yield.

All renewed life are feeling;
Falcon on the gnarled oaks
Perch aloft; while warbling, wheeling,
Larks sweep high in airy flocks
Through the gladsome glorious heaven;
And young lambs are gently stealing
Through the vale—beneath the rocks.

See, the uprisen bees are swarming
Round the fragrant almond tree;
Joyous children, all unarming,
Sporting in their circled glee
Round their hoarded eggs of Easter,
While the aged men are warming
In the sun's rays joyously!

Blossoms, that fresh life are feeling,
Burst your bonds! Soft flowers, that bloom,
Through the tender mosses stealing,
That in pity deck the tomb—
Come ye forth, and tell your mission!
Types to holiest hopes appealing,
Emblems of our happy doom!
Truth's sublime in everything
Waked to life by breath of spring.
Thus shalt thou awaken me—
Breath of immortality!

A WORD ON THE ROADS.

UNTIL about the year 1555, the highways and byways of England were under no law, and the making and maintaining of them was left to any parties who felt interested in preserving a communication between one place and another—a state of things not very creditable to the nation; for the Romans, fifteen hundred years before, had set an example of making and keeping up great leading thoroughfares from one end of the kingdom to the other. A law at length passed on the subject in the reign of Philip and Mary laid down no general principles for road-making, further than that each parish should maintain its own roads, by means of forced labour, at the order of surveyors annually chosen by the inhabitants. Till the present day, all the parish and cross-roads are made and supported in terms of this primitive code, the forced labour, however, being generally commuted for certain exactions in cash on the lands and houses in the parish. The road rates are a kind of taxes too well known to need any particular explanation of their character.

Half a century had not elapsed from the passing of the act in the reign of Philip and Mary, when the plan of supporting all the roads on the parish system was found to be inadequate for the general accommodation. Some parishes would have the road running this way, some that way; some did not care about having roads at all; a few kept the roads in good repair; and many let them remain in the worst possible condition. Instead of utterly overthrowing this complex and clumsy arrangement, a plan was introduced for maintaining, on something like a uniform and efficient principle, certain great roads through the country. The era of this improvement was the year 1641, when the notable expedient was adopted of throwing barriers across the roads at regulated distances. For the device of turnpike gates, as they are now termed, we have therefore to thank the parliamentary wisdom of the reign of Charles I. The English by no means relished this novel method of maintaining the chief thoroughfares: it was quite opposed to all their ideas of freedom, and was so very unpopular, that for more than a century it was not adopted for any other channel of communication than that called by travellers the Great North Road, which passed through Hertfordshire, Cambridgeshire, and Huntingdonshire. The roads, generally, remained in a disgracefully bad condition till past the middle of the eighteenth century. Even in the neighbourhood of the metropolis, they were at certain seasons scarcely passable. In 1703, when Prince George, husband of Queen Anne, went from Windsor to Petworth, to visit Charles III. of Spain, the distance being about forty miles, he required fourteen hours for the journey, the last nine taking six. The writer who re-

cords this fact says, with much simplicity, that the long time was the more surprising, as, except when overturned, or when sunk fast in the mire, his royal highness made no stop during the journey!

In 1763 turnpike gates were established in all parts of England, and since that period they have been the grand engine for supporting the principal thoroughfares, the parish and cross-roads remaining under their own local management. The history of the roads in Scotland is the same as that for England, only that the compulsory or statute labour, and also the toll system, were of later introduction. Turnpike gates did not make their appearance in Scotland for half a century after their general introduction into the neighbouring country. The first set up were also equally unpopular, and it required all the powers of the law to preserve them from destruction. By the united efforts of parish and other rates, commutation of statute labour, and revenue from tolls, the roads generally throughout Great Britain, from Cornwall to the furthest limits of Scotland, are now in excellent condition, though far from what they might be under a more rational process of management. According to returns to parliament, the length of the turnpike roads in England and Wales in 1829 was 19,798 miles, and in Scotland 3666; making a total of 23,464 miles. At the same period, the length of all the other roads was 116,000 miles; making the entire length of the public highways and byways at least 139,000 miles. In England and Wales, the number of turnpike gates was 4871; the debts on the roads amounted to L.7,304,803; and the current expenditure on all the roads for one year was L.1,455,291. In Scotland, the debts were L.1,495,082, and the expenditure L.181,028.

Such are a few of the more prominent statistics respecting the financial affairs of roads; but one still more worthy of note is the number of bodies who take on themselves the management of this vast machine. There are ten thousand parishes in England; but as many are small, and unite for road business with adjoining parishes, it is believed that there are not more than seven thousand boards of management, each with proper functionaries paid for attending to the condition of the highways. To this seven thousand are to be added the trusts appointed by the legislature to manage the turnpikes. Of this class, in 1829, there were 1119, and the number of the acts of parliament, which inspired them with life and vigour, was 3783. To keep the 19,798 miles of great roads in repair, required, we say, the apparatus of 1119 distinct trusts, 4871 toll-bars, and 3783 acts of parliament. According to this rate, a trust is required for every 17½ miles, and an act of parliament for every 5 and a fraction miles. As an act of parliament generally costs L.500, the turnpike roads of England and Wales may be said to have cost L.100 per mile for legislation. The ratio is somewhat different in Scotland.

In that country, a trust seems to be required for every 9½ miles, and an act of parliament for every 19 and a fraction miles; which is at the rate of little more than £.26 per mile for legislation. Not had this, however, for Scotland, considering that a number of the Highland roads are supported by government, and do not require much doctoring in the way of special acts of parliament.

Placed in this broad and grotesque light, the whole road system of Great Britain, with its eight or nine thousand managements, its endless exactions, and its universal network of toll-bars, is, without exception, the most awkward and absurd institution on the face of the earth. Laying aside altogether the loss of time, and the personal trouble and expenses of the individuals composing the trusts, the cost incurred for making and maintaining the roads is enormously disproportionate to the ends attained. No plan could have been invented to act so ruinously on the funds, as that of levying money at turnpike-gates from travellers; for the cost of a turnpike-house and gate every five or six miles, and the cost of supporting a keeper, must all fall to be deducted from the proceeds. Were it possible to institute a rigorous examination, it would probably be found that, what with charges for acts of parliament, charges for toll-houses, gates, and tariff boards, profits of lessees of gates, and support of keepers, with heavy miscellaneous charges, not more than fifty to sixty per cent. of all the money collected is at the disposal of the trustees for behoof of the roads. In other words, from two to three pence, out of every sixpence handed to the turnpike-men, are absorbed by managerial expenses.

In a work recently published, to which we have pleasure in referring—'Road Reform,' by Mr William Pagan, a Scotch country solicitor*—the ratio of managerial expenses for toll-bars is stated at nearly what we have here supposed it to be. Speaking of the counties of Fife and Kinross, the writer describes them as containing 394 miles of parish or statute-labour roads, and 461½ of turnpike roads; total 855½ miles. The annual average amount of all levies whatsoever for these roads is £.33,547, 7s. Of this sum, less than one-half, or only £.16,110, 17s. 7d. is expended on the ordinary repair of roads and bridges; £.7061 is disposed of for management; and the remainder goes to pay the interest, and to reduce the principal of the road debts. But this, he says, does not include the cost of local road legislation, law expenses incurred between lessees and private parties in questions of tolls, and the loss arising from the unproductive nature of toll-houses and gardens. Nine acts of parliament are at present in operation on the roads of the two counties, and the cost of these has been £.3532, 10s. 9½d. One of them, procured in 1842, cost as much as £.575, 7s. 3d. At the renewal of the acts, equally heavy expenses will have to be incurred. Mr Pagan calculates that the annual burden for local road acts on the two counties is £.207, 6s. 1d.—a large sum for a district of country not larger than Hertfordshire. With respect to the loss incurred in erecting toll-houses, he tells us that there are within the district 78 of these establishments, independently of a large number of small lodges and collection boxes; the whole together, along with 69 steelyards, or cart-weighting machines, having cost the road funds not less than £.10,000.

Enough has now been said to show how ineconomical—or rather how positively wasteful—is the present mode

of maintaining the roads of Great Britain. But the direct pecuniary loss, bad as it is, is perhaps less grievous than the universal dissatisfaction which tolls create, their impediment to free intercourse, their injurious effects on manufactures and commerce, and their prevention of agricultural improvement. 'The whole working of turnpike tolls,' observes Mr Pagan, 'has been again and again condemned—we may almost say by the universal voice of the country—and a spirit of dissatisfaction has been roused against it, which, in South Wales particularly, very recently attempted to put down the system by physical force. In that part of the kingdom, as will be well remembered, multitudes of people met, night after night, under the leadership of Rebecca—sometimes at one point and sometimes at another—and, despite all the local authorities, straightway destroyed toll-gate after toll-gate, razing, at the same time, the toll-houses to their very foundations. In short, for a time the Rebeccaites held undoubted sway in South Wales, to the dismay of that portion of the empire, and, indeed, to the uneasiness of the government and the country at large. The military had to be called in from a distance; the London police had to locate themselves in the disturbed districts; a few, but very few, of the numerous persons concerned in the riots and in the bloodshed—for some unoffending toll-keepers suffered—were brought to justice; and it was only after measures of energy and conciliation on the part of the executive, that the disaffected were overcome and the districts restored to peace. These proceedings occasioned enormous expense.

'In South Wales, as elsewhere, turnpike gates had been oppressively numerous, and the rates correspondingly severe. Farmers were met by tolls in every movement of their produce; they could not drive any distance after paying a toll, till, at probably the next turn, they came upon what some act of parliament had constituted a separate trust, and where they found it necessary, before going farther, to pull up and pay a second toll. A little farther on, by some other legal arrangement, there would be another trust and another toll, and so on. And, while the farmers were in the first instance the sufferers, their customers—the public at large—had to share the cost with them, the price of their produce being necessarily increased to enable them to carry on their business. Their grievances were proved before a special commission, which was appointed with a view to discover the cause of the toll-bar riots, and the remedy, and their report (6th March, 1844) forms a thick folio volume of the parliamentary papers.' The result of the inquiry was a thorough reform of the South Wales toll system. Riot, it is sad to say, procured that which peaceful remonstrance failed to accomplish. By a consolidation of trusts, and a reduction of the number of turnpike-gates to one in every seven miles, her majesty's Welsh subjects have been happily pacified.

That the Scotch have not broken out into such excesses as happened in Wales, is ascribable more to the long-suffering character of our countrymen, and their commendable respect for the law, than to the mildness or equity of their toll-bar system. Edinburgh is surrounded with a mesh of thirty-five toll-bars and checks, several indecently placed within the streets of the town, and the greater number in the immediate environs. Cupar, the county town of Fife, is surrounded by thirteen toll-bars within a circuit of three miles of the market-cross, and seven of them close to the town, preventing intercourse with the adjoining fields. The author before us, however, gives even a worse case than this. Speaking of a road between Leven and Kirkcaldy, 'this

* Edinburgh: Blackwood and Sons. 1845.

presents to the world the *beas ideal* of the toll-bar system, for there the trustees have done their work so well in the matter of toll-gates, that it is acknowledged to be quite impracticable to set foot upon the road at all without being caught by some one or other of their gates. The length of the road is just $7\frac{1}{2}$ miles, and we find upon it exactly 7 gates—that is, one for every mile—five of them upon the line of road, and two of them by way of supporters or check-bars. On entering this road from the east (after having paid at Lundinmill toll-gate, in the St Andrews district, only two miles back), we are taxed at Scoonie toll-gate, where we may be asked whether we are to stop at Leven, or how far we are going? and not being disposed to afford this information to our inquisitor, we ask him in turn what is the lowest sum at which he will permit us to pass his gate? He then explains that his is what is called a half toll, and, gig and all, we get through for threepence. Half a mile forward we are upon the lively town of Leven and its excellent new bridge, where we find a pontage-gate, and there both biped and quadruped must make their bow to Charon, and submit to his toll exaction. A short distance further we are upon Methil-hill toll-gate and its check, where we must pay sixpence, which clears the remaining bars on this road, as the toll-ticket thrust into our hand informs us. Armed with this passport, we get through the Percival and Bowhouse gates without further payment, and make our way to Kirkcaldy—before entering which, however, we come upon the barrier of the trustees of that district—the East Bridge toll-gate—where we have to pay our nimpence.

The prevalence of so many barriers to free intercourse, as is well known, leads to evasion in every imaginable way, it being thought quite fair to trick the toll-keeper out of his dues. A knowledge of this proneness to deception of course renders the 'pikeman churlish, and he not infrequently goes beyond the bounds of his commission. The truth is, toll-keepers give a very wide interpretation to the statute; they do not readily observe that there are no rules without exceptions. Hence a world of small litigation. Mr Pagan relates a case of a 'pikeman attempting to take toll a second time in one day for the same cart, on the plea that it was a different loading. The carter having resisted, the 'pikeman seized his horse and cart; and thence a litigation ensued. After being battled through several courts, the case was quashed, each party paying his own expenses, which amounted to L54, 17s. for the 'pikeman, and L124, 18s. 10d. for the carter. Besides incurring this damage, the unfortunate recusant lost his horse, which, having been put to livery by the tollman, was sold, after incurring a bill of L18 for his keep. Both parties appear to have been the victims of an ambiguity in the act of parliament. In the following case, embracing a mixture of the dolorous with the grotesque, we are reminded of the famous litigation of *Bullum versus Boatum*. A Dumbartonshire tollman brought a passenger before a justice of peace court for attempting to cheat him of nimpence, and the charge being substantiated the passenger was fined L2, with L3 of expenses. But the 'pikeman had better let the case drop; for the passenger prosecuted him for an assault, and showed that he had been beat and cut at the time he attempted the evasion. The sheriff before whom this grave charge came for trial, decreed for L14 of damages and L2 of fine; but this not satisfying the prosecutor, he carried the case to the court of Justiciary, which increased the damages to L100, and L5 of fine, with expenses. The 'pikeman was doubtless left L200 out of pocket by the transaction.

When we speak of 'pikemen suffering such awful losses, we perhaps fall into an error; for in most instances they are only servants of tacksmen, or lessees. Anciently, it was customary for poor men with wooden legs, or some other infirmity, to take a toll-bar, and on the free proceeds they were able to rear a family in something like respectability. Capital, which has spread its paws over everything, has not made an exception in favour

of this humble means of livelihood. The old wooden-leg men are now generally driven far a-field. When the day for auctioning the toll-bars of a trust arrives, capitalists, who know all about the roads and their capabilities, attend and swamp the small bidders. One man will thus take a dozen bars all round a neighbourhood, and, by employing sharp and trustworthy keepers, on whom he keeps an eye, will contrive to make a little fortune in the course of a few years. If a wooden-leg man be now anywhere seen at a toll-bar, it is only as a servant to some great master 'pikeman, or on some remote and little-frequented road.

In this way the keeping of toll-bars has been pretty generally monopolised by clusters of capitalists. Any new capitalist, not of the 'pike corporation, is well known to have no chance as a competitor; because, if a toll be knocked down to him, the enemy will drive him from the road. We have heard it confidently asserted, that any new man taking a toll-bar near London, will be ruined by those who look upon him as an intruder. They will entice all kinds of public conveyances to come by other bars; so that in the end the luckless wight is glad to give up his bargain, and retire to some new field of enterprise. These monopolists of the road are, it seems, not less sensitive on the score of intrusion by the trustees. Occasionally, trustees feel aggrieved by perceiving how profitable the toll-bars are to their lessees, and they determine to take the gates into their own hands, only employing servants as collectors. In almost every instance this turns out a false move. No such toll-bar ever pays: it is impossible it should pay: the employé, a very decent man, cannot tell how it is, but there is no money taking. Sixpence only passed yesterday, and eightpence the day before. The thing evidently won't do. Seeing that the world has resolved against travelling so long as they keep the toll-bar in their own hands, the trustees prudently put it up once more to auction, glad to rid themselves of the incumbrance.

We have said so much of road mismanagement under the barbarous toll-bar system, and of the loss it causes to the country, that what we have to offer by way of reform must be stated very briefly. The whole scheme, however, may be contained in a nut-shell. Abolish the parochial or cross-road managements; abolish every kind of road-rate and statute-labour assessment; and abolish the toll-bars as one of the greatest nuisances that ever afflicted a free country. In lieu of this complicated machinery, the author of 'Road Reform' proposes to consolidate the road trusts, each to embrace a whole county, or at least a considerable district; the trusts at the same time to be somewhat more popularly constituted than they are at present. His method of raising funds to maintain all the roads and bridges in the kingdom, to pay the interest and principal of the road debts, and to liquidate every necessary expense, consists in laying a tax of 30s. annually on every horse; and to prove how well this plan would work, he enters into a calculation of what would be produced in the counties of Fife and Kinross. In that district there are 12,000 horses, by which, at 30s. per head, the sum of L18,000 would be raised; such, as already shown, being the amount required to maintain all roads and bridges in the two shires. According to this simple plan of operation, there would, in comparison with the present absurd process of exaction, be an annual saving of L15,000, that being the sum at present thrown away on 'pikemen and other engines of collection. To be exact, the difference between the two plans is expressed by the comparison of L18,055, 16s. 8d. with L33,547, 7s. What would hold good for two agricultural and populous Scotch counties, may be supposed to be answerable for Great Britain at large; and if so, then is the problem of road reform at once settled; we need not say how much to the relief of travellers, coach proprietors, agriculturalists, and the public generally. Our own ideas of road reformation would have pointed to the public revenue for the means, and to government for the

management; but, on consideration, Mr Pagan's proposal is so simple, so likely to be generally popular, besides being efficient in minor details, that we give it the preference. At all events, throwing down the subject, we leave it to fructify in the minds of our readers.

BE JUST BEFORE YOU ARE GENEROUS.

A TALE, BY MISS ANNA MARIA SARGEANT.

'HERE'S a gentleman wants to know the rent of our first floor, mother,' cried little Frank Ashton, running, as he spoke, into the back parlour, where a quiet-looking young woman sat engaged with her needle. Mrs Ashton arose in haste, that she might answer the interrogation of the stranger, wondering at the same time whether her son had dignified him by the appellation of gentleman from courtesy, and thinking that if such were not the case, her accommodations would not be sufficiently good.

The question put to the child was repeated to the mother by a tall middle-aged man, whose manner and bearing bespoke him to be something above the class of persons inhabiting the little street in which he was now seeking for a home; and Mrs Ashton having answered it, led the way up the narrow but clean staircase, to tempt the stranger by the sight of her plain neatly furnished apartments. A brief survey was sufficient; and the terms being agreed upon, he begged permission to take possession of them immediately, as all the luggage he had, he said, was a portmanteau, which was at a neighbouring inn. The hesitating manner with which this request was received caused a flush to mount to his before pale cheeks. 'You require a reference, ma'am,' he quickly said; 'and it is right perhaps that you should do so of a stranger; but I have none to give. I am unknown in London, having but recently arrived from America, in which country I have spent the principal part of my life. All I can do,' he added, 'is to offer a few weeks' rent in advance.'

This reasonable apology for the want of the usual credentials satisfied the unsuspecting mind of the worthy matron, and she readily acceded to the terms, at the same time politely offering that her little handmaid should fetch his luggage. He declined smilingly, replying that he was not above carrying it himself; and adding, that he would, with her permission, employ her during his absence in lighting him a fire, and preparing the comfortable beverage of tea. 'I shall soon be quite at home here, I see,' he pursued, looking at a group of lovely children who had stolen one by one up the stair, and were now clustered at the door to get a peep at the 'strange gentleman'; and he familiarly patted the cheek of one, and stroked the glossy curls of another, as he passed.

'Oh, father, we have got such a nice new lodger,' exclaimed the three younger children in a breath as they clung about Robert Ashton's knees, 'the envied kiss to share,' on his arrival at the wonted evening hour.

'A new lodger!' he repeated in some surprise, and he looked at his wife for an explanation.

Mrs Ashton in a few words related the circumstances under which she had taken in a fresh occupant for her floor, and concluded by saying that she hoped her husband would not think she had acted imprudently.

'You have acted just as I should have done had I been at home, my love,' was his reply.

'But I am not quite certain that it was exactly prudent notwithstanding,' she gaily rejoined; 'we were so unfortunate with our last lodgers.'

The conversation was broken in upon by the arrival of two young men, one of whom had been long acquainted with the family. 'Ah, Ashton, my dear fellow,' he exclaimed, as he shook him heartily by the hand; 'I knew I should find you here, like a good Benedict, by the side of your wife in your own home.'

'This is my world, Morris,' Ashton returned, as he smiled complacently on the dear ones around him.

'And a happy world it is,' rejoined his friend. 'I never leave your fireside without a determination to marry, and have such a home of my own. But to proceed to the subject which brought us hither to-night: I am come to make an appeal to your benevolence.'

'I am sorry for that, Morris,' cried Ashton, 'since my resources are pretty well exhausted. However, I am not so destitute as to be without a few shillings for a fellow-creature in need. Pray, tell me the case.'

'My good friend here is raising a subscription for the widows of the poor men who were drowned last week,' Morris made answer.

'And have you been at all successful in your errand of charity?' Ashton asked, addressing his visitor.

'Far from it,' was the reply; 'people cry out so much at the badness of the times; they have scarcely enough to enable them to be just, much less to be generous, they say.'

'That is a paltry excuse,' cried Ashton contemptuously; 'an excuse made by the niggardly to apologise for their parsimony. Alice, my love,' he added, 'draw us a jug of ale, and let us drink success to this gentleman's undertaking; meanwhile, I will subscribe my mite'; and as he spoke he placed a piece of gold in the hand of the young man.

'Oh, sir, were all the world like you, there would be no misery arising from want,' was the exclamation of his visitor, as he gazed in surprise at the liberal donation from one whose apparent circumstances scarcely warranted the hope of a fourth of the sum. 'I assure you,' he added, 'that I have talked for half an hour to men who revel in riches, and, after all, could with difficulty wring from them a small piece of silver.'

'Alas! this is a selfish world,' responded Ashton with a sigh.

'I told you that I would answer for your success there,' exclaimed Morris, when he and his companion had left the door. 'There is not a more generous fellow breathing than Bob Ashton, and yet I am afraid he is but indifferently off. I hear he is much in debt.'

'In debt!' repeated his friend in astonishment and concern. 'I wish,' he added, 'that you had informed me of that circumstance before, for I certainly would not then have made the application.'

'Why not?' interrogated Morris. 'Is a man never to give away a penny because he owes a pound?'

'His just debts have undoubtedly the first claim,' was the reply.

Whilst this conversation passed between the two friends without, a dialogue of a somewhat similar nature was carried on within. 'Mother,' cried little Frank, as with his brothers and sister he knelt at Mrs Ashton's feet to offer up their evening devotions; 'mother, tell me, if you please, which is the greatest virtue, generosity or justice.'

'Justice, my child,' was the mother's unhesitating reply.

'I thought so,' pursued the little inquirer; 'but I was not quite sure.'

'I am glad that you asked me, then, my dear boy, she tenderly returned, bending to kiss his glowing cheek as she spoke; 'I am very glad that you asked me, because I wish you to bear that in mind through life. Generosity,' she pursued, 'is a brilliant quality, which attracts general admiration; but it may be possessed by persons wanting in almost every other virtue. Men who have set at nought every moral, social, and divine law, have been frequently known to be eminent for generosity; whereas justice is of so solid a character, that it can scarcely dwell in a soil which has not some other excellences.'

'But we may admire generosity if it be in a robber, may we not?' asked the child, looking earnestly in his mother's face.

Mrs Ashton smiled. 'We can scarcely do otherwise than admire that which is in itself lovely, be it found where it may,' she made answer; 'but we must never, my dear Frank, let our admiration set the better of our

judgment, or we may be led to imitate the vices and failings of an individual, because there is some shining quality about them. The generosity of some persons, she pursued, 'is an impulse, producing that indiscriminating charity which frequently encourages vice, and does more evil than good; and that benevolence is only worthy of admiration which flows from a sense of duty to God and our fellow-creatures.'

'Dear mother,' resumed the child, encouraged by her gentle tones to proceed, 'I think it must have been a struggle between generosity and justice that I felt this morning, when I was coming back from the toy-shops after buying my humming-top. I met a poor blind man looking so hungry and cold, that I could not help wishing I had seen him in my way there, that I might have given him the money instead of laying it out for a toy; and whilst I was thinking so, a gentleman near me dropped a shilling from his purse without noticing it. This shilling, thought I, would buy the poor beggar man two or three meals, and the gentleman looks as if it could be no object to him to lose it.'

'And what did you do, my dear?' Mrs Ashton with eagerness inquired, seeing the boy hesitate whether to proceed.

'Why, mother,' he returned, 'I must confess that I was strongly tempted to conceal the money, and afterwards give it to the beggar; but that little voice which you have told me was conscience, softly whispered that it would be a theft, as much as if I had taken it out of the gentleman's purse with my own hands, and that I had no right to be generous with that which was not my own; so I gave the gentleman his shilling, and left the poor blind man without. Did I do right, mother?'

'Quite right, my dear boy,' Mrs Ashton exclaimed, folding him in her maternal embrace; 'we certainly ought never to do evil that good may come, and I trust this little incident will be a lesson to you through life, never to sacrifice what you know to be right to gratify even such an honourable feeling as benevolence, or in any way compromise justice for the sake of indulging in generosity.'

'Alice, my love,' cried Ashton, when Bessie had taken the children to their chamber, and they were left alone, 'I thought you praised the probity of our dear little boy to the exclusion of his warmer feelings; surely some word of commendation was due to the kind wish which would have given up the humming-top he has so long been setting aside his pocket money to purchase, for the sake of affording a meal to a fellow-creature in want?'

'Your experience in the world must have led you to observe how often such impulses end where they began—in wishes,' she smilingly returned. 'The benevolence which I deem most worthy of commendation is active. In the case of our little Frank, however, I believe it to have been sincere,' she added; 'and the only fear is, of its becoming too exuberant.'

'Too exuberant! Do you deem it possible for it to be too exuberant? Can we be too self-sacrificing for the good of others, Alice?'

'Nay, my dear Robert,' she gently returned; 'we cannot, I think, be too self-sacrificing; but we may sacrifice one duty in order to practise another; and it was the triumph of right over false reasoning that I thought the most worthy of notice in the little transaction which our dear boy was relating.'

'We differ a little, Alice, in our ideas of generosity,' Ashton interposed; 'and yet,' he quickly added, 'it is only with your theory that I quarrel—with your practice, my love, I find no fault.'

'It were better to be defective in theory than in practice,' she gaily returned; 'but I only contend that, to be really valuable, generosity must be united with other moral virtues, and with justice in particular, otherwise its lustre fades into comparative nothingness.'

Ashton sat musing, but did not reply; and the entrance of Bessie with the supper put a period to the conversation.

Week after week passed away, and Mrs Ashton had

no cause to be dissatisfied with her new lodger, who was found to possess those two virtues which are of the highest esteem in the opinion of the lodging-house keeper—quietness, and regularity in the payment of rent. Meanwhile, the strange gentleman (for such he was still denominated) made rapid progress in the favour of every member of the family. Frank was delighted with his glowing accounts of the wild scenery of America—the younger children with his willingness to share in their gambols. Ashton felt interested in him from the very fact of his being apparently friendless and unfortunate, and Alice from a combination of all.

'Oh, father, the strange gentleman is gone,' was the simultaneous exclamation of the little group one evening as Robert Ashton entered his home.

'Gone!' he repeated in surprise. 'Is this information true, my love?' he interrogated, addressing his wife.

'Too true,' she returned, whilst a tear stole down her cheek in spite of her efforts to repress it. 'He is gone, my dear Robert, under circumstances of a most painful nature.'

'Yes, father, the men took him away; and mother says they will not let him come back again to play with us,' pursued the little prattlers.

Ashton turned to the mother for an explanation. 'The poor man was arrested this morning, and carried off to the Fleet prison,' she said; 'but I believe, from a few words which were dropped, that there is some injustice in the transaction. It appears to be for the expenses of a lawsuit which he has been urged to engage in on false grounds by the very person who has now arrested him.' Ashton uttered an ejaculation of indignant feeling, and was adding a somewhat illiberal and sweeping remark upon the legal profession, when his wife interrupted him by observing that the best way to show his sympathy would be for him to offer his services to the stranger in such a time of need, which, she doubted not, would be most acceptable, as he appeared not to have a friend in London.

'You are right, my love,' he returned; 'I may perhaps procure his enlargement by becoming bail for him.'

'Do nothing precipitately, dear Robert,' exclaimed his wife; 'you know nothing of his character, and his name has only this day become known to us.'

'Yes, we found out his name, poor gentleman, through the bailiffs,' cried Bessie, who was in the parlour busily employed preparing tea. 'They asked for Mr Paul Logan, and when I said I didn't know such a person, but that I would ask the gentleman on our first floor if that was his name, they followed me up the stairs.'

'Logan, did you say—Paul Logan?' Ashton exclaimed.

'Yes, sir, I know it was that, for I thought it a strange outlandish name.'

'Do you know the name, Robert?' Alice asked in surprise, for she could not but notice that it had awakened some unpleasant feelings in the breast of her husband.

'Yes—that is, I once knew a family of the name of Logan,' was his reply. 'But are you sure it was Paul Logan?' he further interrogated; and Bessie, nothing loath to be a speaker, proceeded to attest the truth of her assertion by saying that she heard the bailiffs call him by that name several times.

'Are you ill, dear Robert?' cried Mrs Ashton in alarm, perceiving with the quick eye of love that a sudden paleness had overspread her husband's cheek.

'I am not quite well,' he faintly replied, leaning his head upon his arm as he spoke.

Alice flew to offer him a cup of the refreshing beverage she had just prepared. 'I shall not be able to go out to-night, my love,' he said; 'I will retire to bed; perhaps a night's rest may restore me to myself. Alice urged that medical advice should be procured; but he positively refused to permit it, requesting only her assistance in ascending the stairs to his chamber.

The duties of the mother called Mrs Ashton from the

side of her husband, but her thoughts wandered as she gathered her little ones around her. The sudden indisposition of Ashton had obviously arisen from the associations connected with Mr Logan's name; and yet, strange to say, she had never heard him mention it before. A vague foreboding of evil came over her; though she called into exercise that strength of mind which was natural to her character, and strove to repel it.

Ashton attempted to dissipate the fears of his wife, by making light of his indisposition; but perceiving that he was really ill, she positively refused to retire to rest, and taking up her needlework, she seated herself quietly by his bedside, assuring him with a smile of affection that a night thus spent would do her no injury. Finding her resolute in her determination, he resisted no longer, and strove to compose himself for sleep; but vain was the attempt. 'Tired nature's sweet restorer' fled from his pillow, and he lay tossing from side to side in a state of feverish excitement, which called forth the worst fears in his anxious partner. 'You must allow me to send for medical aid as soon as it is light,' she tenderly said, as she took his burning hand within hers, and counted the quick throbbings of his pulse.

Ashton shook his head.

'Nay, I must act without your concurrence for once, then,' she returned, 'for I deem it my duty to do so; you are not in a state to attend to your business as usual.'

'Medicine cannot minister to a *mind* diseased, dearest Alice,' he made answer.

'A *mind* diseased!' she repeated. 'Oh! my beloved husband, if your malady is of the mind, why not confide in the faithful breast of one who would sympathise in all your sorrows, and do her utmost to alleviate them?'

'I shrink from telling you the cause of my distress, my own Alice,' he passionately returned, 'because I could not endure the thought of sinking in your esteem; but now I feel that I can bear this torturing concealment no longer; and though it lead you to despise me, I must tell you all.'

'Despise you, dear Robert!' the wife exclaimed, while her mild eyes filled with tears; 'surely you cannot have been guilty of anything so heinous as to call forth such feelings from me? Speak freely, my husband; open your whole heart to me, and no word of reproach shall, I promise you, escape me.'

'It is not your reproaches I fear, dearest Alice,' he made answer. 'I know you are too kind to inflict further torture; but your nice sense of justice will recoil from the conduct of your erring husband, though he may not have acted as the world in general would censure. No, it is not your words of condemnation I shrink from, but the verdict of your upright heart.'

'The pangs of self-reproach are far more bitter to endure than any other,' the wife interposed; 'and these,' she added, 'may perhaps be removed. If you have, as your words seem to indicate, committed an act of injustice, is there no way of making reparation?'

'None, none,' was his reply, and he buried his face in his hands in an agony of grief.

'Say not so, my husband,' she soothingly rejoined; 'let me hear the circumstances, and we will together see if reparation be impossible; perchance it is not quite so difficult as you imagine.'

'It can only be accomplished by reducing you, my Alice, and our children to beggary,' he exclaimed bitterly.

'And do you think that I would shrink from sharing poverty with you?' she asked.

'You might not, my dearest Alice; your firm mind would, I feel assured, meet any exigence; but I must be the basest of men to put you to the trial. No, let me suffer alone.'

'You cannot suffer alone,' pleaded the wife; 'every throb of your heart is responded by mine, and with ten-fold acuteness. But I must hear your confession, and we will then decide upon the right course to be pursued.'

Ashton raised himself on his pillow: never had he

felt so truly humbled as at this moment. So full of self-love is the human heart, that it not unfrequently feels less compunction in committing error than in acknowledging it.

'You have often heard me speak of my father,' he began, 'as a man proverbial for his integrity; indeed so much so, that his word was deemed of more value than the bond of most men. But this character for probity has unfortunately been the means of throwing temptation in the path of his less high-principled son. Amongst his acquaintances was a person of the name of Logan. This gentleman was far his superior in birth and education, yet a warm friendship existed between them, which was only terminated by death. Mr Logan died in the prime of life, leaving my father his executor and guardian to his children, who were handsomely provided for; but a fit of apoplexy shortly after carried him also to the grave. It was not till after my parent's decease that I became aware of the extent of the trust reposed in him by his friend; and this intelligence was communicated to me through the medium of a letter I found amongst his papers, which was addressed to me, in case of any accidents befalling him. He began by informing me that Mr Logan had a son by a former marriage, who had left his home, and (it was supposed) embarked for America, owing to the unkind treatment he had received from his stepmother. Of this youth no tidings had ever after been heard; yet the father cherished the hope that he lived, and would some day return to his family. With this impression on his mind, he lodged the sum of five hundred pounds in the hands of his friend, trusting to his known integrity for its being safely delivered to his unfortunate son, should he ever appear; for no entirely had he been governed by his second wife, that he dared not make any provision for him in his will; thus the transaction was only known to themselves.' Ashton here paused to wipe the cold damps from his brow; then looking earnestly at his wife, hurriedly added, 'You surmise the rest, dear Alice; you see the brink upon which I stood. My father adjured me to preserve the sum, and permit the interest to accumulate, with the same scrupulous integrity as he himself would have done, and on no account to appropriate any part of it to my own use. But I was young, and almost unprovided for, my love for you also had its share in making the temptation stronger. I knew that your parents would object to my suit had I nothing to commence the world with, and I purchased the furniture of our house, and the business in which I am engaged, with Paul Logan's property, and now retributive justice has brought the man I have injured to my very home.' As the unhappy young man spoke, he clasped his hands in an agony of grief, and sunk exhausted upon the pillow from which he had raised himself.

No burst of anguish, however, escaped the lips of his firm-minded wife. She sat a few moments in silence; and that brief time was sufficient to show her the course which her husband ought to pursue. 'Give not way to unavailing sorrow, dearest Robert,' she tenderly said; 'the past, though lamentable, cannot be recalled; the present only is our own, and it calls but for promptitude and strength of mind. The line of duty is straight and obvious, and however repugnant to our feelings, must be adhered to.'

'Alice, would you have me make you and our children beggars to enrich a stranger?' he almost fiercely asked.

'No, my husband,' she gently replied; 'it will not be to enrich a stranger, but to perform an act of justice; nor shall we, I trust, be reduced quite so low as you represent.'

'I see no alternative but absolute ruin if I attempt to refund the money,' he cried, 'and that is too serious a matter to be decided upon rashly.'

'I do not advocate rashness,' returned the wife, 'but the course which alone can restore your self-respect, and consequently your peace of mind. Oh, my husband,

she energetically added, as she sunk on her knees beside his bed, 'make, I intreat you, no compromise with your conscience. It has, I feel assured, already pointed out the right path for your pursuit; and however humiliating, however detrimental to your interests, or even to the interests of those whom I know you love dearer than yourself, I beseech you swerve not from it.'

'Alice,' cried Ashton, whilst his voice became almost choked by strong emotion, 'have you taken into consideration that to make up this sum I must dispose of my business, which is our only means of support; that we must part with the furniture of our house; and, what is even worse, I must be myself liable to become an inhabitant of a prison for debts it will then be out of my power to liquidate?'

'Debts!' the wife repeated, with surprise and concern; 'I was not aware, Robert, that you were in debt. I understood that, having commenced business with a small capital, you had avoided contracting any, and I thought that our expenditure was rather within our income.'

'It was so till within the last twelve months,' Ashton in some confusion returned, 'when,' he added, 'I was what you, Alice, will perhaps call foolish enough to do a generous action. To serve my old friend Johnson, I accepted some bills to a larger amount than was perhaps consistent with prudence, and the result was, I was obliged to pay them.'

Alice sighed deeply. 'And why,' she gently asked, 'did you not name this to me before? I would have made any sacrifices at home rather than that you should be involved in difficulties in your business.'

'I should soon have recovered these slight embarrassments, my love,' he rejoined, 'and I could not bear that you should be made unhappy by them; but now, if I follow your counsel, and part with all to refund this five hundred pounds, and the interest, my creditors will of course come upon me for the debts, and I must become insolvent.'

This was a fresh blow to the feelings of the unhappy wife, and she sat for some time in silent thoughtfulness. Meanwhile Ashton, who shrunk still more from the acknowledgment of his breach of trust to the world than he did from the poverty it would involve, was planning some compromise. 'Alice,' he at length exclaimed, 'I have come to the determination of seeing Mr Logan in the morning, and gaining from him if possible an account of the distresses under which he labours. I may be able to serve him without utterly ruining myself and family.'

Alice forbore to say more at present; she saw that his health was already seriously impaired by the excitement of his mind, and she resolved to await the result of his visit to the prison, ere she urged a course which she still saw to be the only right one, however great the sacrifice might be.

The temporary relief Ashton found in the plan he had proposed so far tranquillised him, as to enable him to arise and put it into execution. Mr Logan was overwhelmed with astonishment and gratitude at what he deemed the generous interest taken in his affairs by a stranger, and consequently became as communicative as he had hitherto been reserved. The world, he said, had, from his very boyhood, used him so roughly, that he scarcely believed in the existence of disinterested kindness; and then followed the tale of his early life, which was too well known to his auditor. He further stated, that after spending more than twenty years in America, during which time he had met with misfortunes of various kinds, he had accidentally heard of the death of his father, and supposing that some of his property had been bequeathed to him in common with his other children, he had come over to England for the express purpose of examining the will. This examination, he said, had proved unsatisfactory, his name not being included; but having reason to suspect, from the circumstance of his relatives affecting to disbelieve in his identity, that a forgery had been practised, he had consulted an attorney, who, as appeared from his subsequent conduct,

basely encouraged him to engage in a lawsuit for the purpose of involving him in expenses; when, upon discovering that he was unable to pay but in the event of success, he had not only stopped the proceedings, but arrested him for the sum already due, which amounted to forty pounds.

The feelings of the self-condemned Ashton may be more easily imagined than described, as he was compelled to express indignation at injustice which he could not but own was not more worthy of censure than that he had himself been guilty of, and to listen to protestations of gratitude from the man whom he had in reality so deeply injured. The sum of forty pounds, though more than his present means could command, might, he thought, be without difficulty borrowed of those friends whom he had so often served; and he consequently ventured to promise it, making his anxiety to get the matter settled a pretext for hurrying away.

Mr Logan had implied that it was now his desire to return to America as soon as he could obtain his enlargement, from whence he hoped to remit the sum which Mr Ashton had so generously proffered, though, he said, he should ever deem himself his debtor. This intelligence Ashton joyfully communicated to his wife, whom he found awaiting his return with the most intense solicitude: but she, to his disappointment, felt no satisfaction at the prospect. He thought that time would enable him to repair the injustice he had committed without having any definite plan in view. But the conscience of Alice was not so easily silenced: she saw that justice demanded immediate reparation, and she would have cheerfully submitted to the sacrifices it would necessarily involve—nay, she had already formed projects by which her personal exertions were to assist her husband in the maintenance of the family, and dwelt with pleasure on the peace of mind they should experience in the midst of privation arising from the performance of a right action.

Ashton found the task of borrowing forty pounds less easy than he had at first imagined. After spending the day in going from house to house with little success, he was compelled to raise the greater part of the sum by pledging his watch and some other articles of value; and this done, he lost no time in procuring the release of his lodger. Mr Logan's return was hailed with delight by all save Alice, who, under any other circumstances, would have been the first to rejoice with those that do rejoice; but her oppressed heart could feel no satisfaction whilst her husband's integrity was at stake. She listened with a sickening spirit to the warm eulogiums bestowed upon him by the man whom he had injured, and the singularity of her manner led her lodger to suspect that she had disapproved of the exertions Ashton had made in his behalf; yet this suspicion was so opposed to the general tenor of her conduct, that he found it difficult to comprehend the apparent anomaly.

Ere Mr Logan quitted England, he obtained the advice of an eminent professor of the law upon the probable issue of the suit he had before taken in hand, and received information that it was hopeless. Ashton knew too well the circumstances of the case, and the illegality of the claim; but he dared not hint at his knowledge, and was even fearful of offering the advice he would have otherwise given, lest it should betray his secret. 'It is somewhat singular,' Logan observed, as he returned from his last examination of the will at Doctor's Commons—'it is very singular; but it was, I find, a person of your name, a Mr Robert Ashton, who was made my father's executor; and but for the high character he bore in the neighbourhood for integrity, I should have suspected him of collusion with my family.'

Ashton endeavoured to imply surprise by a sudden ejaculation; but his lips moved in vain—his tongue could not articulate a syllable.

'He died of apoplexy twelve months after my father, I heard,' Logan pursued, 'and his son married, and came to reside in London; but no one could give me any

further intelligence concerning him. I don't know that it would avail me anything, he added, 'but I should like to have seen the young man before I left England; he might have thrown some light upon the matter.'

'Possibly so,' Ashton, with a strong effort at composure, remarked; 'but London is a wide place, and the name is a very common one.'

'My circumstances will not admit of further delay,' Logan rejoined. 'The situation I gave up in order to inquire into this affair may yet be vacant, and I am anxious to return, if it were only in order to repay the sum you have so generously raised for me; but perhaps you will bear it in mind, and, when you can do so without any inconvenience or loss of time, make inquiry for me. I know not another person in London that I could ask.'

This last remark caused Ashton to breathe a little more freely, and he with apparent readiness promised to comply with the request. This discovery of the name was a fresh source of disquiet to the self-condemned young man; for he could feel no security whilst his lodger yet remained in England; but, fortunately for him, Mr Logan was, though from different motives, equally anxious for his departure. Many tears were shed by the little ones when he bade them adieu; and even Bessie Brown lamented him, and readily forgave the concealment of his name, which she now saw arose not from any disgrace attached to it, but the false pride men of birth and education are apt to feel when in reduced circumstances.

Month after month passed away, and the family of the Ashtons were, to the eyes of their neighbours and friends, equally prosperous and happy as before; but there was a canker in the bosom of the elder members of which the world knew nothing. Alice was still the same gentle affectionate being, ever studying the comfort of those around her; but her society was less attractive to her husband, from the knowledge that he had sunk in her esteem. She, from regard to his feelings, seldom alluded to the affair, or even mentioned the name of their late lodger; but he could not but see that it was constantly in her thoughts, and that she ceased to enjoy the comforts of her home, because they were purchased at the sacrifice of duty.

Mr Logan was punctual in the performance of his engagement to refund the forty pounds; but Ashton could feel no pleasure in receiving it, but was rather pained by an act of justice in one from whom he felt he did not deserve it.

It was nearly twelve months subsequent to the departure of Mr Logan for America, that Alice was called upon to fulfil the melancholy duty of attending the deathbed of her only remaining parent. Mr Crosby was a man who had been esteemed prudent even to parsimony; but he had brought up a numerous family in respectability, and realised sufficient in trade to enable him to retire and spend the residue of his days free from the cares of business. It was generally supposed that he would have but little to leave at his death; but to the great surprise of his daughter Alice, who was the youngest, and had always been his favourite, he with his dying breath revealed to her that he had set aside for her the sum of four thousand pounds, adding that he had settled it exclusively upon herself, that it might not be touched by her husband. Alice listened to this information with feelings far from pleasurable. 'Oh, my father,' she exclaimed, 'let not your last act be one of injustice. I have no right to the whole of this sum. An equal distribution would be much more agreeable to my feelings, and the few hundred pounds which would be my rightful share would make me'—very happy she was about to add, for her thoughts were full of the idea of releasing her beloved husband from the weight on his conscience, but the melancholy spectacle before her repressed the ebullition of joy. The dying man could not but admire his daughter's noble act; but it was too late for him to legally repair the injury he had done his other children. She assured him, however, that she

would scrupulously divide the property, and not only so, but make known that such was his latest wish.

The grief of Alice Ashton upon the occasion of her parent's death was much softened by the happy circumstances attending it. She had a double opportunity of exercising that justice she had ever extolled, and the purity of her motives was displayed in the manner in which it was accomplished. The fact of the money having been designed for herself was kept a profound secret, excepting to those persons from whom it could not be concealed; and as she placed her own share in the hands of her husband, and begged him to use it for repairing the breach of trust which had caused them so much pain, she felt a tranquillity of spirit it was long since she had enjoyed.

Ashton saw too clearly how much happiness the payment of the sum would cause his inestimable wife, to make any scruples about depriving her of it. But the next subject for consideration was the manner in which it was to be done. He still shrunk from the exposure of his unfaithfulness to the trust reposed in him, and proposed availing himself of the opportunity given by Mr Logan's commission to discover the son of the executor. It would be easy, he said, to inform him that he had been so fortunate as to meet with the young man, and that he had through his medium conveyed to him the sum, with interest, left in the care of the deceased Mr Robert Ashton. The distance at which Mr Logan resided would, he thought, prevent all further knowledge of the matter, and he should be spared the humiliation of confession. Alice consented to, without approving of the plan, and it was immediately put into execution.

Ashton was in daily and somewhat anxious expectation of an answer to his communication to Logan, when, to the surprise of both husband and wife, that gentleman made his appearance at their door. His hearty greeting met with a restrained reception on their part, which excited his surprise; but attributing it to the circumstance of his sudden and unexpected arrival, he proceeded to inform them that it was his wish to again engage their apartments, if vacant, as he had business which would detain him in London for a few weeks. After thanking them in the warmest terms for the share they had taken in restoring to him his right, Mr Logan expressed a wish to see the noble young man who had so faithfully fulfilled the trust reposed in him.

'You behold him before you—I am he,' Ashton exclaimed, seeing all further concealment would be impossible; 'but I am not,' he bitterly added, 'the noble young man you suppose. So far from faithfully fulfilling, I have basely betrayed the confidence placed in my integrity, and, but for this excellent woman, should never have made the reparation I have done.'

Logan stood paralysed with astonishment, and Alice burst into tears.

'I was too cowardly to reveal the truth even when I had the means of doing justice,' Ashton resumed, whilst the changes in his countenance evinced the strong workings of his soul; 'but retribution follows, and I am not allowed to escape the humiliation of confession. Let your contempt, however, fall on me alone, for I alone deserve it. My angel wife was not a sharer in the crime; but she it was who, by a noble self-sacrifice, made the restitution.'

'You will not—you are too generous to treat my unhappy husband with contempt,' pleaded Alice, now coming forward. 'The temptation to use the property was strong, when your long absence gave grounds for belief in your death; and when he, by the discovery of your name, ascertained the injury he had done you, the reparation would have effected the ruin of his own family. These considerations will, I am sure, soften your resentment, Mr Logan,' she pursued. 'My husband may have been culpable, but he is not so base as intentionally to wrong any one.'

It was some time before Logan could recover his astonishment sufficiently to speak; but when he did so, it was not to upbraid, but to soothe the self-condemned

young man and his weeping partner. Grateful for this delicate consideration for his feelings, Ashton now frankly related every circumstance connected with the transaction, to which his auditor listened with mingled sensations of pleasure and pain. His admiration of the conduct of Alice amounted almost to veneration, and for her sake alone he could have overlooked the tardy justice of her husband. But there was in his character also something to admire, though much to lament. So deep was his contrition for the error he had committed, that there is little probability of its recurrence, even should a similar temptation assail him; and he now sees the necessity of enforcing upon his children the truth he once deemed a fallacy, that impulsive generosity is frequently accompanied by weakness of character, and that it is only when it becomes ennobled by being associated with justice, that it is really estimable in itself, or extensively beneficial in its results.

PROPOSALS FOR A NEW ORDER OF MERIT.

THERE was once such a thing as the Golden Age. I am persuaded one of its chief constituent features must have been there being no authors in it. Men were then innocent of all crimes, writing books included. Delightful age, too good by far to last! Error and writing came together, and the Golden Age was no more. It is remarkable how soon the world came to be marked by this dismal propensity to scribbling. Look we in upon it three thousand years ago, we find the Jewish sage declaring that of writing of books there was no end. Glance at it two thousand years ago, we see Horace bewailing how, learned and unlearned, all were writing. At the present time, the evil has reached a magnitude which seriously threatens all domestic comfort. The difficulty is now to find a man or woman who does not write. A gentleman proposed to us one day to compile a dictionary of living authors. 'It is done already, sir,' said we; 'have you ever seen a book called Pigot's Directory?' There is a story told of a gentleman who, having a great detestation of authorship and authorcraft, but at the same time liking men of sense and ability, went about for some years in search of such a person who should not have written a book. There was no appearance of success, till one night, travelling from Selkirk to Edinburgh by the coach, he found in one of his travelling companions all the requisites of intelligence and pleasant manners, without the smallest trace of any connection with the press. He felt sure he had at length found the proper person, and longed for morning light to enable him to behold the man whom he was to take to his heart of hearts. The coach stopped at its destination while it was still dark; the stranger came out into the lamplight. The friend-seeker rushed to examine him, when, behold, the chatty, agreeable, and apparently non-literary stranger proved to be no other than Walter Scott, by that time the author of a century of volumes. The story concludes by representing the inquirer as vanishing in an agony of despair.

And well he might, for evidently there is hardly any such person now living. I have a faint recollection of meeting just one man in very early life, who was clever and agreeable, and yet was *said* not to have written anything; but I cannot be quite sure of his innocence. Perhaps, if rigid inquiry were made, he might be found to have produced a dozen condemned plays, or a score of still-born volumes. Not the daylight lantern of Diogenes, not the offer of a premium of fifty guineas in the Times, could now elicit the happy individual who has not at some time tormented his fellow-creatures with pen and ink. It is a terrible case. We used to have

strong edicts long ago in our nursery against that state of things when all speak and nobody hears; but what is that to a grown up world in which everybody writes and no one reads?

Clearly, something ought to be done—but what? An association binding the members to buy no new books—that would be of no avail, for the want of sale has evidently no terrors for the literary tribe. A Society for the Suppression of Superfluous Literature by positive means—that would only do harm, for everybody would fly to see the books which had been proscribed by such a grave and reverend body. Might the interference of the legislature be looked for? Or would it be of avail? Doubtless, the British legislature would do anything in reason for the discouragement of authors. See already that well meant, though, after all, but little effectual measure, the taxing of paper equally which sells over the booksellers' counter, and which goes to the trunk-maker. But I fear that the legislature has done its best already; it has exhausted its means of repressing the literary trade. Fiscal measures evidently won't do. Suppose a bill to fine publishers for every bad book they brought out? Alas! the publishers already do their very utmost to keep bad books from appearing. One half their time is occupied in declining offered manuscripts, and battling off print-determined poets and sages. Murray has had to refuse a volume of poems regularly once a fortnight ever since he ceased to publish for Byron. Should there be a tax, then, on all books? No use. They would be printed on the continent, and smuggled in. No, nothing of that kind will do. What, what, then, should be done?

We must look to the human nature of the case, and address ourselves to that. The literary mania mainly arises from an activity of the organ of love of approbation. Could we turn this to operate for the abandonment instead of the taking up of the pen, the object would be attained. Here, unquestionably, lies the key of the question. But how could men and how could women—how, in short, could the men, women, and children who write—be tempted through their love of approbation not to write? Easily enough. This is a matter calling for the interference of the fountain of honour. Establish an order of merit for the positive reward of such persons as resist the temptations of the pen. If it were understood that, on proof being afforded of twenty years having been spent in public life without any connexion with the press, one were entitled to be a claimant for the star of some kind of legion, certainly a vast influence would be exerted for keeping men unspotted by ink. They would deliberate thus with themselves: 'If I print, I perhaps acquire celebrity, perhaps not. But, if I don't print, I am sure of being a Knight of the Order of the Inverted Ink-bottle. Of course, I shan't print.' There might be difficulty in the details, particularly as to the authentication of the proper qualifications. A man might have published anonymously, and it might be difficult to convict him. But even though doubtful cases might thus arise, there would still be enough of certain ones to operate in inducing men to keep out of print. Let it be understood that the faintest ground of suspicion had a condemnatory effect, and you would see few suspicious cases. There should of course be various degrees of honour, bearing some proportion to the degrees of self-denial exercised. Those who only could say, 'We received a good education, and have been careful not to abuse it by becoming authors, would constitute the great first rank. A simple riband would serve to distinguish them. When any one had it to say, 'I made a tour on the continent, and never put pen to paper on the subject,' or, 'I once preached a funeral sermon, which the friends asked me to print, and I refused,' then that man should have some higher honour. The intimate friend of a great man who abstained from writing his life in two octavo volumes after his death, would deserve one of considerable distinction. And when it could be fully and satisfactorily established of any otherwise qualified man, that he had passed the

age of twenty-one, in love, and yet abstained from printing a volume of poems, he should be made a knight-commander at the least. What I calculate on is this, that, by such means, all the finer spirits would be diverted from the walks of literature, and the blacking of paper be left only to a few abandoned persons, whose characters would soon bring it into such odium, that books would become duly rare, and only appear under the pressure of exigent occasions.

The proposed arrangement would undoubtedly serve for all those cases in which the moving cause was of an amateur character. But what to do with the vast class where the impulse comes from the desire of making a livelihood? Here I would suggest a humane extension of the poor-law act. To take away all exons from those who profess to scribble for bread, there might be a department in the union workhouses for their reception, provided with stones to be broken for roads, and old ropes to be teased into cakum, or employed in any other way that might be thought advantageous. The application of such a test to the scribblemania would, I apprehend, be effectual. It would then be seen, when any one continued to pester the public with his books, that not bread but notoriety was the object, and, cut off by unrelenting book-sellers, and a pocket-buttoned public, he would be compelled to give up his pursuit, and become a useful, or at least not a troublesome member of the community.

Thus, by one means and another, it might be hoped that society would be restored to a healthy tone, and human genius turned to good and serviceable courses, instead of being misexpended as at present. I can imagine the gradual operation of such measures—here a gentleman amateur converted from a tendency to print, there a poor-devil author rescued from literature, and set to an honest trade, like the appearance of hill-top after hill-top on the subsidence of the Flood. Perhaps, in the course of ten years, we should be finding it possible to pass a day without being asked if we have read such a book, or to enter a drawing-room where we should not have to stand in instinctive horror of two authorisms. Oh, Saturnian time! shall we ever see thee thus return?

AN ENGLISHWOMAN IN EGYPT.

THIRTY years ago 'the land of Egypt' was looked upon with awe. Its gigantic temples, whose origin dates beyond the records of history; its mysterious pyramids and puzzling sphinxes; its gorgeous tombs, and its mummies preserved for more than two thousand years, with the names, residences, and professions of the defunct as accurately inscribed in hieroglyphics as the epitaph on a tomb-stone cut yesterday—naturally excited feelings of veneration, that were consecrated in the mind by the biblical associations with which the mysterious banks of the Nile are connected.

Now, however, the powers of steam and the march of inquiry are fast dispelling the clouds of mystery in which Egypt was wrapt. It is no longer a rarity to meet with a traveller who has mounted the pyramid of Cheops, or stood in the halls of Karnac. Rapid and easy communication with Europe has covered the country with a varnish of utter modernness. European merchants set up their shops under the very eye of Cleopatra's needle; the harbour which was ploughed by the argosies of Mark Antony, is now hourly agitated by the paddles of steamboats; and in the city founded by Alexander the Great, Italian operas are performed at least once in every week 'during the season.' Huge

fronts not far from some of the world; and to crown of the Irradiates has been eminent engineer Mr Gallo-

way, with a view to a railway between Grand Cairo and that part of the Red Sea in which Pharaoh and all his hosts were drowned.

Over these innovations and commonplace novelties the antiquary and reader of Herodotus sincerely mourns; but we cannot wholly sympathise with his lamentations. The means by which this amalgamation of the old with the new has been effected is also the means of extended intercourse with our eastern brethren, which has immense advantages. It breaks down the barriers of prejudice, across which each party steps to mangle and to fraternise. The Mussulman no longer insults the Christian by the name of 'dog,' and we, on our part, cease to regard Mahomedanism as the sensual, immoral creed which it was formerly believed to be. The people of the East, and those of the West, are daily coming to an improved understanding, and to regard each other with a charity which increases in degree on further acquaintance. By means of this feeling, the blessings of knowledge are spread, and commercial communication—the mainspring of social comfort between whatever countries it exists in—is augmented. There are far more substantial advantages than are derived from a dreamy admiration of the monuments of antiquity, or from the ultra-conservative efforts of those who, to preserve traces of the past, would damage the prospects of the future. Still, to such enthusiasts the union of the modern with the ancient, which the outward and visible signs of Egypt present, are extremely distressing. Five-and-twenty years ago, an amateur of the antique happened to see a lady's maid in a pink spencer amongst the ruins of Thebes. This so shocked his notions, that he made the best of his way back to France. 'Having,' he says, 'no longer any desire to look at anything, I departed that very night.' What would he say now, when with every Indian mail dozens of English damsels pass through Lower Egypt, when a European female is by no means a rarity in the streets of Alexandria, and when there is a lady who is now actually residing in Grand Cairo? It is to introduce this lady to our readers that the foregoing remarks have been made.

One effect steam communication seems to have had is to extinguish in the European fair sex all dread of trusting themselves in the land of harems. Till the authoress of 'The Englishwoman in Egypt,'* whose work we have just perused, none had been bold enough to choose that country as her abode. This lady—Mrs Poole, sister of Mr Edward Lane, the author of that minutely curious and interesting work, 'The Manners and Customs of the Modern Egyptians'—determined to leave the pleasing vicinity of Kensington, to accompany her brother to the crowded, hot, and uncomfortable city to which the natives give the grandiloquent name of Al-Kahirah, 'The Victorious.'

After a short voyage, the fair traveller and her family arrived at Alexandria, and proceeding through the canal of Mahmoodiyeh, thence into the Nile, were speedily steamed up that renowned river to Bulac, the port of, and two miles distant from, Cairo. The sole means of conveyance for this short journey is on the back of an ass; and it was thus that Mrs Poole made her entrance into Cairo. This mode of conveyance, which is thought somewhat disrespectful of England, is by no means so derogatory in Egypt, the donkey of that country being as far superior to other donkeys as the Arabian charger is to the Suffolk punch. 'The ass of Cairo,' says the lively author of *Scenes and Impressions in Egypt*, 'even the hired one, is a Royal descendant of the *Spreghely* of the Arabian Nights; a fine-sized animal with a parti-coloured pack-saddle, having a high pommel covered with red leather, on which you may lounge, lean your hand, or suffer your hands to lie. He is provided with stirrups and

tion room of the British Museum, which—translated in the catalogue above adverted to.

* During Letters from Cairo during 1848-4, with E. W. Lane, Esq., author of the *Modern Egyptians*; by his sister (Mrs Poole). In two volumes. Charles Knight and Co.

bridle, half European.' These animals are such favourites, that upwards of forty thousand of them were said to have been in use in Grand Cairo alone.

Mrs Poole's first impressions of the city are thus described:—'It has the appearance of having been deserted for perhaps a century, and suddenly re-peopled by persons who had been unable, from poverty or some other cause, to repair it, and clear away its antiquated cobwebs. I never saw such cobwebs as hung in many apertures, in gloomy dark festoons, leading me to consider the unmolesed condition of their tenants. I wish I could say that I do not fear these creatures; but surely in the insect world there is nothing so savage-looking as a black thick-legged spider. After passing through several of the streets, into which it appeared as though the dwellings had turned out nearly all their inhabitants, we arrived at an agreeable house, situated in the midst of gardens, in which we are to take up our temporary abode. Graceful palm-trees, loaded with their fruit, meet our eyes in every direction, while acacias, bananas, orange and lemon trees, pomegranate trees, and vines, form a splendid variety; and but for one essential drawback, the coup-d'œil would be charming; this drawback is the want of refreshing showers. The foliage on which we look is perfectly covered with dew, and the soil of the gardens is watered by a wheel worked by a patient bullock, who pursues his round about with little intermission, and thrives in his persevering labour. The plan of the gardens is very curious; they are divided by long parallel walks, with gutters on either side, and subdivided into little square compartments, each about two yards wide, by ridges of earth about half a foot high, and the water is admitted into these squares one after another. When I looked upon the little ditches and squares of water, remaining for some time without absorption, I could not but remember our bright pretty gardens in England, and how carefully, in watering our flowers, we avoided saturating the mould, both because it would be injurious to them, and displeasing to the eye; and these recollections almost brought me to the conclusion, that a garden in Egypt is not worth the trouble of cultivation. So much for national prejudice and love of home scenes.'
